MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

Traveler's Guide.

JOHN CRUMP, - - Proprietor,
Chestnut St., cor. 15th,
PHILADELPHIA.

CALIFORNIA.
Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?
The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.
This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.
This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.
For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.
Leaves Erie Railway Depot, foot of Chambers St. New York.
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars
The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

AGENTS WANTED TO OBTAIN Subscribers for the best Agricultural and Family Weekly Newspaper. Liberal commissions for little work. Address RURAL PUBLISHING COMPANY, Box 3315. 78 Duane St., New York City.

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau (Wis.) Republican.*

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lawn of Life.*

Wit and Humor.

"NOBLESSE OBLIGE."

INTERLOCUTOR.—"Who's that showy woman who talks and laughs so loud, and digs people in the ribs?"

Interlocutrix.—"Oh, that's the Duchess of Bayswater. She was a Lady Gwendolen Beaumanoir, you know!"

Interlocutor (with warmth)—"Ah! to be sure! That accounts for her high-bred ease, her aristocratic simplicity of manner, her natural and straight-forward—"

Interlocutrix (putting up her eye-glass).—"By the bye, pardon me! I have unintentionally misinformed you; it's Mrs. Judkins. She's the widow of an alderman, and her father was a cheesemonger in the New-cut!"

Interlocuter.—"*Dear* me!—ah!—hum!—er—hum!—ha! That *quite* alters the case! She is very vulgar, I *must* say—*awful!*"

[N. B.—It *was* the duchess after all].—*Punch.*

SPARKS AND SPLINTERS.

MEN of stamp—Postmasters.

THE national gait—Investigate.

A PROFESSION easel-y learned—The artist's.

A FLAGGING industry—The paving business.

A VERY narrow aperture—The crack of a whip.

MOVING for a new trial—Courting a second wife.

How to violate the tenth commandment in two letters—N V.

WHAT all would fain have and many feign to have—Money.

DOMESTIC Magazines—Wives who blow up their husbands.

WHY should you never tell secrets in a cornfield?—Because all the stalks have ears.

WHAT bird is likely to take most care of his toilet?—The cock, because he carries a comb.

MASTER—Now where did the Cyclops live? Youth—In Cyclopædia, please sir. Master—Go down.

IF a young lady wishes to encourage her lover, the best thing she can do when he gives her a squeeze is—*to repress* him.

"THE horse bit his master;
How came it to pass?
He heard the good pastor
Say, 'All flesh is grass.'"

IRASCIBLE gent (to waiter)—"They say there's nothing like leather, don't they?" "Yes, sir." "Then it's a lie, for the steak is!" (Waiter evaporates.)

"YOU are a nuisance! I'll commit you!" said an offended judge to a noisy person in court. "You have no right to commit a nuisance," said the offender.

AFTER a play a young Frenchman said to his friend. "I could play the lover better than that myself." She replied:—"Then, why in conscience don't you?"

A SHREWD old Yankee said he didn't believe there was any downright cure for laziness in a man. "But," he added "I've known a second wife to hurry it some."

AN editor at a dinner party, being asked if he would have some pudding, replied in a fit of abstraction:—"Owing to a press of more unimportant matter, we are unable to find room for it."

IT was Lord Houghton who, when a lady, more beautiful in her own eyes than those of the world, was boasting that she had had hundreds of men at her feet, remarked in an undertone "Chiropodists."

AN Irish agricultural journal advertises a new washing machine under the heading—"Every man his own washer-woman," and in its culinary department says that "potatoes should always be boiled in cold water."

A MERCHANT went home the other night and said cheerfully to his wife:—"Well, my dear I have failed at last." "Oh, that's good!" exclaimed the wife with a radiant face; "Now we can go to the Centennial, sure."

SOON, very soon, that delicious interval will arrive when the war-worn city pastor takes his needed recreation, and the young man in holy orders occupies his vacated pulpit in search of earthly distinction and a rich wife.

A CAPTAIN caught an Irish boy in the middle watch frying some pork and eggs he had stolen from the ship's stores, to whom the captain called out:—"You lubber, you, I'll have none of that!" "Faith, captain, I've none for ye," replied the lad.

FRANK BUCKLAND is, as usual, industrious as ever; he has discovered another hybrid—knows it can be easily acclimatized in this country, and has done well for years. It is a cross of the bee (not a spelling one) and a bug; he proposes to call it "humbug."—*Sporting Times.*

TWO VIEWS OF THE SAME SUBJECT.

Quaker Landlord.—Thee are good to thyself, JOHN, and if thy boarders are reasonable, thee will have cause to be glad of the Centennial.

Boarder.—There he goes. It's easy to see we have the herbs and he the contentment. Wants me to play shadow to his sun dial. Followed him yesterday two miles to get a good square *smell*, that I might not forget what a good dinner was like.

"THE VIBRATOR."
1,000 SOLD LAST SEASON
WITHOUT ONE FAILURE OR REJECTION.

This is the famous Threshing Machine that has "swept the field" and created such a revolution in the trade, by its MATCHLESS GRAIN-SAVING AND TIME-SAVING principles.

THE ENORMOUS WASTAGE of grain, so *inevitable with other styles* of Threshers, can be SAVED by this Improved Machine, *sufficient, on every job, to more than pay all expenses* of threshing.

FLAX, TIMOTHY, MILLET, HUNGARIAN and like seeds, are threshed, separated, cleaned and saved, as easily and perfectly as Wheat, Oats, Rye or Barley.

AN EXTRA PRICE is usually paid for grain and seeds cleaned by this machine, for extra cleanliness.

IN THE WET GRAIN of 1875 these were substantially the ONLY MACHINES that could run with profit or economy, doing fast, thorough and perfect work, *when others utterly failed.*

All GRAIN, TIME and MONEY wasting complications, such as "Endless Aprons," "Raddles," "Beaters," "Pickers," etc., are *entirely dispensed with*; less than one-half the usual Gears, Belts, Boxes and Journals; easier managed; more durable; light running; no costly repairs; no dust; no "litterings" to clean up; not troubled by adverse winds, rain or storms.

FARMERS and GRAIN RAISERS who are *posted* in the large saving made by it, will not employ inferior and wasteful machines, but will *insist* on this improved Thresher doing their work.

FOUR SIZES made for 6, 8, 10 and 12 Horse Powers. Also a specialty of SEPARATORS designed and made EXPRESSLY FOR STEAM POWER.

TWO STYLES OF HORSE POWERS, viz.: our improved "Triple Gear," and our "Spur Speed," (Woodbury Style), both "Mounted" on *four* wheels.

IF INTERESTED in Threshing or Grain Raising, apply to our nearest Dealer, or write to us for Illustrated Circular (sent free) giving full particulars of Sizes, Styles, Prices, Terms, etc.

(CIRCULAR.)
Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

Floricultural.

ARUM DRACUNCULUS.

The Arum Dracunculus, of which our sketch is from life, has never received an extravagant amount of praise either for its beauty which is of the monstrous sort, or for the odor which it possesses in an eminent degree and which it is pleasanter to describe by telling what it is not than by what it is. Many naturalists suppose that it is the fragrance of flowers as well as their bright colors that attracts the insects necessary to their fertilization. In the instance of the Arum, the velvety-purple of its spathe may alone suffice, else it must be supposed that odors that are offensive to the human olfactory are agreeable to that of the insect—a supposition that is not, however, improbable when we consider how variously the same odor affects different persons.

We find in the experimental grounds which are now devoted to the Rural New-Yorker where the Arum is now blooming, that the goblet-shaped bottom of the spathe which surrounds the stamens and pistils of the spadix, is partly filled with various insects which feed upon the pollen. The nut-like pistils are crowded about the base extending an inch or more upwards where they meet the stamens. It is very easy for the insects to creep up the rough surface of the pistils and feed upon the pollen; but above the stamens, the spadix is naked and slippery so that they find it a troublesome if not an impossible matter to escape in this way. Equally difficult is it for them to creep up the inflexed sides of the swollen part of the spathe. After an inch or so of progress, they lose footing and fall to the bottom where they exist in numbers sufficient to crush or smother one another. As the spathe of this Arum consists of a leaf, the edges of which are not joined together, the swollen bottom allows water to escape, otherwise in this plant as in the pitcher and other so-called carnivorous plants, the insects would be drowned and an opportunity afforded to our infinitesimal botanists to investigate whether in this, as in those, the putrid animal bodies were not "dissolved by this subtle fluid and converted into plant-food."

Symplocarpus foetidus or Skunk Cabbage—*Arisaema triphyllum*, Jack-in-the-pulpit, Indian Turnip—*Peltandria Virginica*, the Arrow Arum—*Calla palustris*, the Water Arum—*Orontium aquaticum*, Golden Club—and *Acorus calamus* or Sweet Flag are all hardy natives and well suited to semi-aquatic or wild gardens. The Skunk Cabbage is something to laugh at when mentioned as a garden ornament, yet we see leaves no bigger, no more vigorous, no prettier, that grace "sub-tropical" beds that are taken up every fall and carefully looked after until another spring. Shame upon the fellow who, regardless of "What's in a name" and, looking through his nose instead of through his eyes, should have dubbed this plant both specifically and generically with names so far removed from the romance of flowers as to have condemned it "forever and a day" to the meadow and swamp.

Speaking of the Wild Garden—it is with real pleasure that we are enabled soon to present our readers with a long and interesting original article upon this subject from the pen of the Editor and Founder of the London Garden, Mr. William Robinson—a gentleman who, through many years of devotion to horticulture, has never wearied of reminding his readers "how far Nature's ways of displaying the beauty of vegetation have been diverged from in the adoption of a few varieties of plants for culture on a vast scale, to the exclusion of interest and variety and too often of beauty and taste."*

* Gardens of Paris by Wm. Robinson.

But to return to our deserted *Arum Dracunculus*. It averages two feet in hight and consists of 6 or 8 curly leaves pedately or hastately parted, on long petioles which are spotted like a leopard-skin with dull brown. The spathe is one foot or more in length, of a vivid, glossy, red-dish-purple inside, deeply veined and green outside except the edges which are also purple.

The Caladium, Calla Lily and many of our finest hot-house plants are sisters of the Arum. One of the showiest is the brilliant *Anthurium*, elegant specimens of which may now be seen in Horticultural Hall of the Centennial Exhibition.

CINNAMON VINE. INDIGO PLANT.

In your notes in Horticultural column of Rural you think it probable that the "Cinnamon Vine" is the same as the well-known "Madeira Vine." Since making my inquiry of you I have received a few words from a friend which I think clearly make a distinction between the two Vines. Below is what my friend has to say about it:—"It will certainly prove a great favorite when better known. It hails from Japan as many of our best plants and shrubs do. The Vine grows from a tuberous root which increases in size from year to year, some of them attaining the weight of several pounds, and as the roots increase the vine is much larger and stronger and of very rapid growth. It is perfectly hardy in central New York, farther north I do not know anything about it. I would say it is easily propagated from the little spherical tubers which form upon the vine. A well grown specimen will grow about 25 feet in a season. The blooms are most deliciously fragrant filling the air for some distance around with a spicy fragrance which suggests the name of Cinnamon Vine. It can also be cultivated within the house with the greatest of ease and will no doubt be a great acquisition to our climbing class of plants. The vine has no tendrils with which to cling to its support but like the Madeira Vine will twine around any object for support such as a pole, cord or trellis. Fragrance, hardiness and ease of culture are its most desirable qualities. Do not know of any roots for sale at present, but I presume some florists have them." Perhaps you may get some information from the above—at least, I hope you will. I will still endeavor to get one of the vines, and then we will see.

THE ARUM DRACUNCULUS.

You seem to be well pleased with wild plants. We have a few in our section that would attract your attention if you were here. Near my home are several plants of *Baptisia*, or as some prefer to call them Indigo plants, which are well worthy a place upon any floral grounds, but I presume if China or Japan were named as its native home, they would be sought as a great novelty, providing a round price were placed upon them. Perhaps the most noticeable one of the class is *Baptisia leucantha*—it is really grand in appearance at present time, having attained a hight of four feet and bearing an erect raceme of large, pure white flowers. The flowers are in form like the common pea but somewhat larger. But the most noticeable part is the immense raceme; only think, 30 inches in length—this the central one—the others are of various lengths, the number of buds and flowers being about 120. The plant is a strong grower of dark-green color which turns a little black in drying. The seed-pods are all inflated and are somewhat of a curiosity to many. We have one or two more of the *Baptisia* in our section, but this one *B. leucantha* is most conspicuous. Who is there that cultivates this grand native plant? I intend to save seeds from several plants for the Rural Brigade if any should desire them. I would like to see them in the possession of all who have a taste for our native plants.

Oregon, Mo. J. W. Maple.

[Send us a leaf, flower or root—or all, if you can, of what you call the Cinnamon Vine.—Ed.]

SEEDLING DAHLIAS.

Mr. Maple of Oregon, Mo., writes us that he has just finished transplanting Seedling Dahlias and expects to have some new and distinct kinds of his own as the result. "The seeds were sown in hot-bed on 1st of April, and I look for nine-tenths of them to bloom this season. I prefer growing Dahlias from seed to many of the coarse-growing annuals, such as *Zinnia*, &c. I have been at a loss to know why the growing of the Dahlia has not been more strongly recommended by the Old Rural and other floricultural papers;—yes, and why some of our seedsmen who persist in saying they will not bloom until the *second year* should not give them a trial and become convinced of the error of their way. I give my Dahlias the same care that I do early cabbage plants; and who is it that cannot raise cabbage plants? No one, I hope.

"To get the *best seed* has been a great trouble to me. I always select the very *choicest mixed*, and the result is variable in the extreme—about one-half prove double, though many have an objectionable color. Will report this fall of my success."

[We are always glad to get the results of actual experience.—Eds.]

Striking Pinks in Water.—A. D., in Garden, says it has recently been found that Pink pipings strike freely tied up in small bundles and placed in water. When the roots are well developed, the pipings should be pricked out into a frame or under hand-lights until they are strong enough for moving into pots or borders.

Industrial Topics.

HOW TO REVIVE INDUSTRY; OR, THE CAUSE AND CURE OF "HARD TIMES."

BY WILLIAM J. FOWLER.

Excessive cost of production is the cause of "hard times." When labor ceases to be profitable because the product is not worth what it costs to produce it, the consequent idleness of millions of men and women results in a proportionate decrease of national wealth. This must in time be felt in a greater or less degree by all classes of citizens. How to produce most cheaply is, therefore, the problem in all industries. To this end all skill and labor-saving machinery are directed. But in the present depression in business ordinary skill fails to secure the just reward of labor. We are told that "the hand of the diligent maketh rich." This is true in ordinary times, but now we find men working diligently and becoming more involved in loss. Under such circumstances it is their duty to make political economy a part of their business and give some attention to removing the burdens from productive industry. A large majority of our industrial population now fully appreciate the importance of this subject.

Industry has for many years labored under unusual burdens. First of these is enormous taxation, all of which is ultimately paid by the productive industry of the country. The State, Federal and Local taxes amount to more than seven hundred million dollars a year. This is more than the volume of our currency. If the tax gatherer could hold all the money paid to him for one year, there would be none left for business, and before the close of the year he would be compelled to take property "in kind" in payment of taxes. Part of this enormous burden on industry is a legacy of the war; but much may be lessened by economy in administration.

The protective tariff imposes a heavier burden on industry. The avowed object of "protection" is to make an artificially-dear market for the manufacturer to sell in. But this dear market increases the cost of production, and is thus a tax on all industry. Even the manufacturer finds that the high price of everything he buys takes away the profit on what he sells. Increased cost of production excludes him from the foreign market—sometimes neutralizes the tariff for his protection and exposes him to ruinous competition from his foreign rival. The burden on all classes diminishes their power to buy. With decreased, because costly, production, there is an apparent excess of products from inability to sell them. Hence there is stagnation in business, men are thrown out of work, and the country steadily grows poorer. The great agricultural industries are most injured. The tariff increases the cost of what the farmer buys. The prices of his crops are fixed by competition with the products of other counties in the London and Liverpool markets.

Depreciated currency adds to the cost of production, and is thus much such a tax on industry as is the tariff. Like that, it excludes American producers from the foreign market, and also like that is especially injurious to the farmer. His crops are produced under the high prices of a depreciated currency, but they are sold on a gold basis. Is it any wonder that farming is unprofitable under this double burden?

How to bring the greenback to par is the foremost question for American statesmanship to solve. We need a currency as good as gold in order to produce as cheaply as possible. There is no talismanic charm about the glittering metal. The substantial benefit of having money redeemable in gold is that it insures to our producers the same standard of value that is used in other countries. Gold itself we cannot have as currency, for the country is much too poor to afford it. There is no large accumulation of gold here, and we cannot accumulate it. All that our mines produce is needed to pay interest on our national debt held in Europe. We can only get more gold by working harder and producing more that will exchange for it. Until the country is a good deal richer we must be content with a greenback currency, kept as near par as possible. When we revive industry by removing its burdens, bind up the wounds of the war and repair its losses, the great natural advantages of our country will bring an influx of wealth and give us a specie currency just so soon as it is best we should have it. Any attempts to force this process by purchasing gold to resume specie payment before the country is prepared will prove futile. The London gold market is as sensitive to any rude approach as the apple of the eye. Try to buy gold in any large amount, and the Bank of England will at once put up its rate of discount high enough to forbid further purchases.

Much is said about the depreciation of the currency, as if this were the chief cause of our financial depression. No doubt it has aggravated it; but it is more the sign of the poverty of the country by reason of the war, high taxes and other burdens on industry. Men do not say that a fever patient is dying because of parched lips and tongue. These are only symptoms of the disease. Our depreciated currency is only a symptom of the poverty of the country. Producing more wealth is the only remedy. Men talk about an excess of paper money. There is no reason to believe that our currency is excessive. In the present unnatural condition of industry, no one can tell how much currency the country needs. Business paralysis has made it seem that there is an excess of money. The same cause has made an apparent excess of all productions. With a revival of industry we shall probably find that there is not currency enough. Increase wealth and the currency question will settle itself. When we have the wealth we shall have the gold also, for other countries will seek to exchange it for our productions. Just now England is the great gold center of the world, partly because England has enjoyed a longer peace than any other great country, and is, therefore, richer. We have greater natural advantages than England, and a revival of industry will speedily change the current of specie toward instead of from us. By removing the burdens from productive industry we can insure profitable employment for all and increase our productions fully one thousand million dollars per year. The enforced idleness of men who would gladly work has cost the country during the last three years more than the amount of our national debt. The country is so much poorer by this paralysis of industry, and so much the less prepared to resume specie payments. Decrease taxation—make it possible to produce cheaply, and the country will progress to a specie standard without injury to any productive industry.

No plan for specie resumption is practical which does not take into account the effect on the business interests of the country. Contracting the currency will only increase the depression of industry. The destruction of greenbacks will not give us gold, but leave us no money whatever and no means of exchange except barter—a return to the methods of barbarism. Yet this violent and unnatural policy, which will cripple the industry of the country by withdrawing the means for conducting it, is seriously proposed. Leading financiers tell us that this will release us from all financial evils and prepare the way for "better times." Such men hope to become wealthy in a financial revulsion which would bankrupt ninety-nine hundredths of the business men of the country. They are only paralleled by Mrs. Brom Brice, a worthy dame who lived in Westchester County sixty or seventy years ago, and who used to go down the Hudson to New York to sell her truck. Returning from an unsuccessful expedition, she spitefully said that she wished everybody was dead and "then she would go to New York and sell butter!" Much that passes for statesmanship and financial wisdom in these days is stolen from Mrs. Brom Brice.

Mere talking for specie resumption accomplishes nothing. Fixing a date and doing nothing to make resumption possible is equally absurd, besides being a threat of a forced and unnatural resumption, and so injurious to all industrial interests. Men who talk most for "hard money" may really be doing least to secure it. When the two sons were called to work in the vineyard, the first said, "I will not," but afterward repented and went. The second said, "I will go, sir," but went not. It matters little what men do about the currency. Whoever advocates the removal of the burdens from industry is doing the best to bring the country to a specie basis. (Another excellent and practical way is to go to work in some productive industry.) When Abou Ben Adhem asked to be written "as one who loved his fellow-men," he little thought that his name would "lead all the rest" in the list of "those who loved the Lord." But so it proved.

It is comparatively little that the Government can do directly for the currency, but it can and should own the greenback by making it fundable in a long-time, low-rate, gold-bearing bond. A fifty-year bond at 3.65 per cent. would at once be worth 90, or more, and as the country became richer would steadily advance to par. When those greenback bonds were par, of course greenbacks would also be par, and without any derangement to business interests. The greenback was originally exchangeable for all United States bonds; but this provision was long since repealed, and since then the poor greenback, like a foundling on a doorstep, has been left to shift for itself. It is strong proof of popular confidence that the disowned greenback has kept so near par as it has. Making it fundable in a long-time, interest-bearing bond is an act of justice already too long delayed. Besides, nothing which the Government can do to the currency will have so good an effect in preventing those violent fluctuations which are the bane of business and industrial activities.

The high rates of interest are another heavy burden on industry. The Government originally demoralized the interest market early in the war by its 7.30 bonds. Still later, its 6 per cent. gold bonds yielded an interest of 12, 15 or more per cent. in currency. The high rates of interest paralyzed legitimate industries. Then began the era of speculation. The profits of the farm, of the shop and of the manufactory would not pay as much interest as could be had by investing in bonds. Only speculators could afford to borrow money. After a feverish whirl of speculation, we find the industries of the country stranded, and enforced idleness saps the foundation of individual and national wealth. The paralysis of business has accumulated idle capital in the money centers, where it is held by men who eagerly look for some financial revulsion which will bring the country to "hard pan." They all hope, like Mrs. Brom Brice, to grow rich "when everybody is dead"—or ruined. In the mean time farmers, manufacturers and mechanics find it as hard to get money as ever. Rates of interest to them are still kept up, stimulated by the high interest which the Government is still paying on its non-taxable bonds. This evil can be partially remedied by funding the seven hundred million 6 per cent. bonds now due in a thirty or forty-year 4 per cent. bond. The saving of 2 per cent. interest on this sum will be the least of its advantages to the country. Its immediate effect will be a reduction of interest on all loans, putting the rate back to the old-fashioned 6 or 7 per cent. common before the war, doing something to relieve the industries of the country, as raising the rate did to embarass them. This great measure of funding the debt at 4 per cent. is, however, only possible by decreasing taxation and in the various ways I have suggested removing the burdens on industry and promoting the prosperity of the country. The revival of industry will add one thousand millions of dollars a year to our national productions. This is the wealth we now yearly lose by enforced idleness. Possibly a still heavier loss may be found in the humiliation of thousands by grinding poverty, who, with a fair chance, might have been industrious and self-respecting citizens.

Pittsford, May 24, 1876.

The Herdsman.

INTERNATIONAL LIVE STOCK EXHIBITION.

The Bureau of Agriculture, International Exhibition, is receiving applications for the assignment of stalls for the display of Horses, Neat Cattle, Swine and Sheep. The live stock show will be made in serial order, commencing with horses, Sept. 1st to 14th; dogs, Sept. 4th to 8th; neat cattle, Sept. 21st to Oct. 4th; sheep and swine, Oct. 10th to 18th; poultry, Oct. 27th to Nov. 6th. No charge will be made as entry fee, nor for the use of stalls, which will be of first-class character in all respects.

The stock yard is of sufficient area to allow the construction of 700 box stalls for horses, each 14 feet square, these to be afterwards divided for cattle, by longitudinal partitions, into 1,400 stalls, each 7 x 14, all of ample elevation and security. The stock yard is immediately alongside of the tracks of the Pennsylvania Rail Road, which, by its connections, is able to transport animals from almost any part of the Union direct to the Exhibition Grounds.

The stock yard will be thoroughly well watered, and lighted by gas, and under the constant charge of a company of Centennial guards. All the prominent transportation companies agree to return, free of freight, animals sent for exhibition upon which full rates were paid in the first instance. Exhibitors, or their agents, will be required to assume the entire charge of horses, neat cattle, sheep and swine, and be alone responsible, although the Commission will do all in its power to provide for the comfort and safety of the animals. Attendants upon stock may sleep in the stalls, or can find ample room at the numerous hotels and taverns in the immediate vicinity. Hay and straw will be furnished by the Centennial Commission free of charge. Roots and grains will be sold at depots upon the ground in the stock yard. The prices charged will be simply those of actual cost, the attendants upon stock drawing the daily supplies upon coupon tickets, which will be sold from the office and furnished to the attendants by their employers. Each breed of well-established character in the various families of live stock will constitute a distinct class, under which awards will be made as provided for in classifications.

Though it is not purposed by the officers of the Bureau of Agriculture to have competition between immature animals, still young animals may be stalled with their dams, that the transmission of valuable qualities may be shown. In this view, breeders are particularly requested to make exhibition of succeeding generations of animals in direct geneology. Single animals and herds, entered for competition in any class, must be the bonafide property of the individual in whose name they are entered. This rule does not, however, prevent State Centennial Boards and Associations from entering for display flocks and herds made up from the stock of various owners.

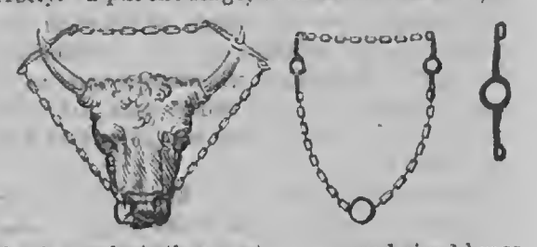
Every animal in its class, as to breed, sex and age, possessing points of excellence, will be reported upon more or less fully, according to its inherent and comparative merit. Exhibitors, whose stock receives the commendation of the Judges, will be presented with a diploma, specifying the typical features of each animal, and supplementary to the diploma, will be presented the uniform bronze medal of the Commission. Of more value than either the diploma or medal, will be the special report over the signatures of the Judges, presented to each exhibitor of meritorious animals, stating fully the reasons why they awarded him a diploma and medal; thus a feature will be developed never before attempted. The Judges on each class will also make a general report upon the characteristics of each breed, especial reference being made to animals exhibited of superlative merit. These reports will be embodied with the reports of Judges on other groups, and be highly valuable for reference in the future. Numbers alone will distinguish animals in the show yard preceding the inspection by the Judges, afterward full opportunity will be given to exhibitors to display their cards and trophies. Animals may be sold at private or public sale during the exhibition, and within the yard: but no animal will be allowed to be removed prior to the evening of the closing day. Special premiums from societies and individuals must be awarded through the hands of the Centennial Commission. During the season of the display of cattle, opportunity will be given, if desired, to exhibit the butter characteristics of the various milking breeds. Churns can be readily had and a room secured for the exhibition of the process of butter making and the qualities produced.

During the display of sheep, a room will be provided for the exhibition of fleeces, to which it is trusted breeders will not fail to contribute. Classification lists and entry forms will be forwarded on application to the Bureau of Agriculture, Centennial Commission. Entries will close on the first day of August.

HOW TO RING A BULL.

Since reading in the Rural last fall about that fight a farmer in Michigan had with an ugly bull, although I admired his courage and perseverance in bringing the animal under subjection, I thought that the old adage of an ounce of prevention is worth a pound of cure was worth a trial.

Having an Ayrshire, three years old, who showed some symptoms of being cross, I went to the blacksmith shop and ordered a ring, made with two arms about two inches in length and the hole in the ring just large enough to slip on the horn near the tip, but loose enough to work freely. I put the rings, with arms attached, on



the horn first, then put on a good-sized brass knob securely, so the rings could not get off, then I attached a piece of metal chain from the ring in his nose to the lower end of the arm of the ring on the horn, then from the top end of the arms I put a chain across from one arm to the other, and from the lower end of the other arm to the ring in his nose.

I have used it on my animal for several months and it works very nicely indeed. He can not hook fence, cattle or anything, for the moment he presses on any part of the chain, it pulls on his nose and he retreats immediately, keeping him under control very easily.

The small bars with hole in the center, which are put upon the horns, are five inches in length and one-fourth in thickness. The chain is linked into each end, as shown in the accompanying figures.

J. D. F. Woolston.

Preble, N. Y.

High Price of Short-Horns.—The high prices at which some of the fancy Short-Horns sell in England shows that there is no falling off in the interest of this old and very popular breed. At Mr. Groom's sale in England lately, a heifer, less than four years old, was run up to $17,500 in gold. Another, still younger, sold at $4,500. What think our farmers about raising such stock, which cost no more to keep than the poorest and cheapest breed.

Dairy Husbandry.

SAGE CHEESE.

An Illinois correspondent inquires as to the best process for making sage cheese. He says: "A gentleman from Chicago tells me sage cheese is not often found on the market, and it commands four or five cents per pound more than common cheese. Is there a market East for such cheese, and how is the sage raised to give the cheese a mottled color?"

Sage cheese is made very much like our common factory and farm dairy cheese, except in the flavoring and coloring. To obtain the flavoring, the sage is steeped in warm water and the liquor strained through a cloth, and is then added to the milk in the vat at the time of putting in the rennet. If it is desired to give the cheese a green, mottled color, the juice of green corn leaves or clover is used for coloring. The leaves are bruised in a mortar or other vessel, so that the juice may be easily expressed, and this is mingled with a portion of the milk taken from the vat immediately after the rennet has been added, and is allowed to coagulate by itself. The two portions of milk, after coagulation, are then "wheyed off" separately, and when the curds are in proper condition for salting they are mixed together.

The green curds being thus intermingled with the white, give the mottled appearance to the cheese, which is often considered essential to the lovers of sage cheese. It may be remarked, however, that the coloring adds nothing to the flavor of the cheese and is for the gratification of the eye alone.

There is always a limited demand for sage cheese in nearly all our markets, and the supply is, so far as we have observed, much below the demand. We believe considerable quantities of this kind of cheese could be sold if it was on the market and at prices that would well pay for its manufacture. Sage cheese is more expensive to make than common cheese, but as it always brings an extra price that more than pays for the trouble and expense of making, it would seem to offer inducements to dairymen for manufacturing in much larger quantities than at present. As a general rule, American cheese is confined too much to one variety. There are several kinds of cheese that are in demand, more or less, and which could be made in limited quantities at a profit; and if the market were well supplied with these varieties, home consumption of cheese would be promoted, and thus the trade would be benefitted in all directions.

We presume there is a market for sage cheese abroad, but the supply has always been so small in this country that none, so far as we know, has been exported. We should advise our correspondent to consult leading dealers in cheese at Chicago and other markets in Illinois, as possibly he may be enabled to obtain a contract for the manufacture of all he can produce, and while we venture the opinion that sage cheese will also find a market at the East, we must add this cautionary advice, namely: that he must not depend simply upon the flavoring of sage to sell the cheese. Sage cheese, to be salable, must be what the cheese-mongers call "rich in meat," that is to say, with plenty of butter-fat in its composition, and in other respects to be well made, showing the quality and other characteristics of fine goods. Poor stuff, having no merit beyond the flavoring of sage and the peculiar mottled coloring of green, will not be sufficient to make it sought after in the market; but, on the other hand, it would soon be discovered as a fraud, and prove in the end a bad investment for both maker and dealer.

MILK AFFECTED BY DISEASE AND OTHER CAUSES.

When animals are suffering from disease the composition of the milk which they yield is quite different from what it is when the animals are in health. In some diseases there is a marked tendency of the fat globules to aggregate. This is the case when cows are affected with the foot and mouth disease where the fat globules also are much larger than in healthy milk, and in advanced stages of the disease they rise to the surface, not as cream, but as pure butter fat. A change is also seen in the envelopes of the butter globules—the thin, firm covering, the particles of fat presenting a glaring, mucus-like appearance, and is intensely refractive.

It is only quite recently that the milk of animals affected by disease has been studied, and it has been found to present changes in composition in a more marked form than had been supposed. All such milk is more or less charged with disease, and there can be no doubt that when the milk of sick cows is used in the manufacture of butter and cheese, it carries its poison to those articles of food. Care should be taken to exclude the milk of ailing cows from human consumption. During hot weather milk is often injured by over-driving cows—by racing them in pastures with dogs—by beating or otherwise maltreating them in the stables at milking time, and all this is done often under the impression that no harm comes from it, so far as the milk is concerned.

The practice of using a dog to bring cows to the stable for milking is a very bad practice and should be abandoned, not only on account of the less quantity of milk which results from such driving, but especially the injury done to the milk. Cows in milk should be driven very leisurly at all times, but more particularly in hot weather and when their udders are crowded with milk. Fast driving then is often very painful to the animal, and not unfrequently some of the blood vessels are ruptured by the strain on the parts, causing bloody milk to flow for days thereafter. We have seen cows seriously injured, simply from being over-driven in this way, and in numerous instances floating curds and other troubles in working the milk for cheese can be traced to the same cause. The subject is an important one, which may well occupy the attention of dairymen during the hot weather, when milk is more difficult to be kept sound than at other seasons.

KEEPING MILK SOUND FOR LONG PERIODS.

Some weeks since, we gave an account in the Rural of experiments made by Prof. Kolbe of the University of Leipsic in regard to the properties of salicylic acid as an antiseptic and antiferment, and the suggestion was offered that it might possibly prove of value in the preservation of milk. We now have accounts of another antiseptic, which, according to the experiments of S. Sewin, appears to be more potent than salicylic acid.

This substance, Thymol, is obtained by distillation from oil of thyme, and occurs in white, highly-aromatic crystals. When dissolved in hot water in the proportion of one part per 1,000, it forms a fully-saturated solution, possessing a neutral reaction. The Popular Science Monthly, which translates from a foreign journal a brief summary of Sewin's experiments, says that 0.1 per cent. of this solution is sufficient to prevent fermentation in sugary liquids, no matter what the proportion of sugar and yeast. "Milk, to which a small quantity of thymal solution was added, did not begin to show signs of coagulation till twenty days later than milk with which an equal quantity of water had been mixed. Filtered white of eggs, in contact with the air, was found to grow putrid in three or four days, whereas white of eggs, with which thymol-water had been mixed, gave not the slightest indication of putridity after eleven weeks. The same results were obtained in treating pus with water and thymal; pus so treated at once lost its putrid odor and continued to be odorless for five weeks, or until it had become dry."

If a substance, operating as an antiseptic and antiferment, could be found which, when added to milk in certain quantities would preserve it, and at the same time contain no properties injurious to health, a desideratum much to be wished would be reached.

It is true our present knowledge, in regard to the causes which hasten the decay of milk, is much more extensive than it was a few years ago; and although proper attention in guarding against these causes will enable the dairyman to keep his milk in sound condition for sufficient length of time to turn it into the products of the dairy, still we need some means for preserving milk that is used for human consumption in cities and villages. Immense sums are annually lost in milk spoiled, either on the hands of the dealer or consumer, and we hope the time is not distant when there shall be discovered a safe, cheap and effective method for keeping milk sound and in its natural state for long periods.

THE GERM THEORY TO BE INVESTIGATED.

The St. Albans (Vt.) Advertiser, of recent date, contains the following:

It is with much pleasure we learn that during Dr. Cressy's recent visit to Vermont, Mr. Bliss, whose guest he was over the Sabbath, perfected an arrangement with him to prepare especially for the next wintor meeting of the Vermont Dairymen's Association, an exhaustive paper upon the germ theory. Dr. Cressy has made the subject of disease germs a special study for many years, and has, at much expense, collected for his library every known work upon the subject. It has become so common an occurrence for tyros and quacks in dairy practice to charge every undesired result to some hidden germ, that a thorough elucidation of the character and effects of germs has come to be one of the urgent needs of the times, and the dairy public are to be especially congratulated that the Secretary of the Vermont Association, who seems on the alert for the development of truth and the dissipation of every obscurity of doctrine, has been so fortunate as to enlist in this cause so able an investigator as Dr. Cressy.

We are reminded in this connection that we should have noticed before the fact that Mr. Bliss secured, some time since, the services of Prof. X. A. Willard, A. M., the well-known writer and lecturer on dairy and agricultural topics, as orator for the annual meeting of the Association, which will be held in Montpelior, October 25th, next.

SELLING BUTTER AT HIGH PRICES.

Mr. Editor:—I saw in the Rural an article, April 23d, p. 263, where a man received 55c. per lb. for his butter, also in a May No. where a lady gets 40@45c. for hers in the South. She did not state where. I would like to have the address of those places in full, so that I, with the rest of my fellow-dairymen, can enjoy the profits of butter making.—Mary Stamp Babcock, *West Dresden, Yates Co., N. Y.*

We frequently get letters like the above, asking the names of parties who pay an extra price for butter. Our correspondents do not always give us names, and when they are given, they sometimes request us not to make them public, as the trade has been worked up at some time and trouble; and it would hardly be considered fair for third parties to be thus publicly led to these special fields to compete by underselling.

We may say, however, for the benefit of our correspondent and others similarly situated, that there are many persons in cities and villages who are willing to pay an extra price for butter, and often a price very much above the market rates, if they can be certain of being regularly supplied with an extra article, freshly put up, and in neat, cool packages. Much, and indeed the bulk, of the very high-priced butter that we have reported from time to time, is made up in pound prints, neatly stamped, wrapped in cloths of immaculate whiteness, and packed in refrigerator-pails or boxes, so that it goes to the consumer as rosy in flavor and as perfect in form as when it left the hands of the manufacturer.

It is delivered at frequent intervals, generally once a week, always on time, always perfect in texture and flavor, and upon these conditions the fastidious customer is willing to pay what is often regarded by many as a "fabulous price." This is the secret of high rates above market values, and if any of our correspondents who have the skill of making a "gilt edged" article desire to realize more than the regular market rates, they must select their customers and work up a trade in the manner referred to. Choice butter, properly packed and sent to market at the right time, will always command a better price than a poor article; but there is no general market where extraordinary rates are reached in a regular way.

EXPERIMENTS IN SETTING MILK.—PRIZE OFFERED.

The Vermont Dairymen's Association, under the management of its excellent Secretary, Mr. O. S. Bliss, has done important service for the dairy interest of Vermont. Mr. Bliss has been indefatigable in his labors to make his Association second to none in the land. The winter conventions have always been largely attended, and no effort has been spared to secure addresses from men well known for their practical and scientific attainments in the various branches of the dairy. These, with the discussions, have been worked up by Mr. B. in a series of reports which are of great value to dairymen.

Last year valuable prizes were offered by the Association for the best samples of butter and for essays on butter and cheese making, and for next winter Mr. B. announces the following. He says:—"The Allen Oil Safe Co. having donated to the Vermont Dairymen's Association one of their Dairy and Family Refrigerators, worth $60, the Association offers it as a prize, to be awarded by a competent jury at the next winter meeting to the person furnishing the best and most instructive report of experiments conducted this season with a view to determine the most profitable depth, temperature and other conditions of setting milk for the production of cream and butter. Competition for this prize is open to the world. Reports must be sent to the Secretary of the Association on or before the first day of January, 1877, and will become the property of the Association for publication, under the rules of the Association, whether prize winners or not."

Mr. Bliss further says:—"The officers of the Association, believing this to be one of the most important questions now before the dairy public for solution, will spare no pains on their part to secure the fullest and most exhaustive experiments, and to this end they invite the cordial and earnest co-operation of all persons interested. They would be glad if the Association had the means to superadd to this a second and third or even a fourth prize for the same object, and they hope that through the generosity of some friend, or friends, they may, before the expiration of the season, be in a situation to do so."

THE CHEESE OF AUVERGNE.

There are several varieties of cheese made in France, which differ essentially in character from that commonly made in this country. A variation in the process of cheese making, or in the quality of material used, gives great diversity of quality to the product. Some of the plans adopted on the Continent of Europe must appear novel to our skilled factory managers. Thus, for instance, the cheese of Auvergne is made by coagulating the milk while fresh from the cow and without the addition of artificial heat. After the whey has separated from the curds and they have attained a somewhat firm consistency, they are placed in a tub, and a man kneads them with his feet.

This operation lasts about an hour to an hour and a half, and the kneaded mass is then left to ferment for forty-eight hours. It is then salted, put into molds and pressed, after which the fresh cheeses thus obtained are put into a cellar, where they are carefully looked after and frequently rubbed with a wet cloth. The cheese made by this process is said to be excellent by those who have acquired a taste for it, though with our English ideas in regard to cleanliness, a knowledge of the kneading process would not be likely to add piquancy in the eating.

Sheep Husbandry.

SHEEP IN AUSTRALIA, &c.

It appears from your correspondent at Philadelphia that in Australia sheep are kept in numbers running one million for every one thousand men, which sounds strange when the comparative number of men and sheep are reckoned in the United States. It would be interesting to know in what way Australia is superior for sheep breeding purposes especially to the Southern States and have somebody explain why wool could not be grown to pay better than cotton.

Cotton is an exhausting crop while wool is the reverse; cotton requires much manual labor while wool needs little.

I note an advertisement for a company to stock land belonging to a railroad, a million acres, which is extraordinary if no swindle, for with the unemployed capital said to be in the possession of capitalists it seems complete imbecility to allow land to be useless which pays the millionaires more and safer interest than aught else, besides giving them a standing in the country equal to that of the Marquis of Westminster, the Duke of Bedford, &c. in England.

What are they afraid of?—Want of knowledge of sheep husbandry is the first thing, want of confidence in the judgment and the integrity of a Land Steward and the utter ignorance of the way to organize an establishment without being compelled to superintend the details of the business, what rubbish! it is absurdity to start a grand undertaking of this kind without doing it in a thorough business like way but it is childish to go to work with men who have failed in all their own endeavors whether in agriculture or otherwise.

Why should not the fine land and beautiful South with its lovely winters be utilized? Why should Australia keep fifty millions of sheep and our State with nearly a similar climate lie idle? why should the little Island of England support a population so extraordinary dense and likewise grow more wool than one hundred such areas would.

I think it is true that England, France and Australia, either one of them grows double the wool America does, it is also true that the United States does not grow half enough wool for her own factories and in addition there is more cloth and woolen goods imported than are manufactured. What an unaccountable and most outrageous folly such a law as protection is for it decidedly defeats its own ends, and how perfectly ridiculous to protect the article which Americans wont grow. Pshaw!—In ten years I could export and bring into this country double what cotton ever brought and save the millions that now are paid for foreign wool and foreign woolen goods besides which all the land devoted to sheep and other stock raising would annually improve.

Working Farmer.

LONG WOOLED SHEEP IN THE UNITED STATES AND ENGLAND.

Will some of the writers who are continually harping about long wools not doing well in New York and Pennsylvania say why they do very well in Canada, which is much colder and also how it is there is no complaining about their being inferior to Merinos in Kentucky where it is hotter, it appears extraordinary that such rubbish in argument should be allowed in good papers as 20 or 30 sheep being as many as a farm should have upon it.

How is it that not only on the same continent in the extreme cold of Canada, mutton from long wools is sought to go to New York City as being so superior to the New York and Pennsylvania, fed mutton and the duty of 20 per cent and heavy freights is paid after which a profit for the importers is added and yet the best hotels reject the meat fed by those who decry long wools? and again as before stated long wools are not written down or changed for other breeds in Southern States. It is repeatedly stated that long wools cannot be kept in large numbers, yet England is no larger than New York State and there are one hundred long wools in England for every Merino in the State of New York. In England there are a thousand sheep herds to every one in Pennsylvania.

Genuine Shepherd.

The Centennial.

CENTENNIAL CORRESPONDENCE.

CENTENNIAL FIELD EXHIBITION,
SCHENCK'S STATION, Pa.,
July 6, 1876.

NOTWITHSTANDING the thermometer ranges among the nineties and a breeze is something to be caught on the fly, the Harvesters and Jurors are hard at work. This morning's sunrise found the wheat field ready and all preparations made for the exhibition to begin, as it had been arranged to start early, with a rest during the heat of the day, resuming in the afternoon.

Apropos of this field. It is situated on the line of the Pennsylvania Railroad, in the town of Bridgewater, at what is known as Schenck's Station. It comprises between forty-six and forty-seven acres, and contains the following (eleven) kinds of wheat:

No. 1, Jennings; 2, Dichl; 3, Fulty; 4, Mediterranean; 5, Shumaker; 6. Clawson; 7, Treadwell; 8, Muskingum; 9, Post; 10, Russian; 11, White Rodgers.

Last September it was prepared and the grain put in by S. N. Gallup, Genl. Agent of the Bickford & Huffmen (Farmers' Favorite) Grain Drill.

Of Mr. Gallup it was said on the ground today that he would make an excellent salesman if it were not for the impediment in his speech. Any one who knows him will at once recognize the correctness of this assertion.

The preparation of the field with fertilizers is a somewhat interesting experiment. A portion of it was fertilized by 900 lbs. to the acre of Superphosphate, composed of Nitrogenous, Phosphatic and Pottassic, component parts, prepared expressly by Geo. E. White of New York, under the supervision of Mr. Landreth, put in by a broadcast seeder and harrowed in in advance of the grain drill.

Another portion of about 6 acres was prepared with the same material, applied in the same way after the drill. This did not produce as much by four or five bushels to the acre as the first, showing the advantage of a thorough incorporation with the soil, the volatile principle being fixed. A still more remarkable example of the complete incorporation with the soil was shown in a piece of 4 acres, where the material was applied by the use of a fertilizer attachment, the superphosphate being brought in direct contact with the seed and buried to a greater depth than with the harrow. On this piece only 240 lbs. to the acre were used, and the results were quite equal to the best of the other portions. It is quite possible, however, that the permanent results may be better where the 900 lbs. to the acre were used. This remains to be seen.

Had not the time been fixed for to-day, it would undoubtedly have been well to harvest the crop several days sooner; but, of course, the time for the exhibition had to be fixed, and the weather was the matter of uncertainty, which had to be taken as it came. It came very warm and exceedingly dry, rain being a thing almost unknown for a week past. The wheat for sowing was supplied gratuitiously by David Landreth & Sons of Philadelphia, as was the grass seed for the hay field by P. B. Mingle & Co. of the same city.

The Jurors had at first contemplated coming here last night and starting early this morning; but they telegraphed a countermaud and did not arrive till nearly 11 o'clock. Immediately upon their arrival, however, they consulted Mr. Landreth and Mr. Geddes and made a start upon the trial of Reapers. The first lot drawn was the Walter A. Wood Reaper and Automatic Binder.

The Binder, whoever gets perfection in it, is the coming implement and deserves some mention. When a machine is built which will, with the aid of two horses and one man, reap and bind the grain as fast as it is usually cut, it will save the labor of at least two and more often three men, who must follow the ordinary harvester, to bind. And the advantage is not alone in the saving of labor, but in the economy of time as well, which is frequently an important item in uncertain weather. And I am, for these and many other reasons, led to believe that he who gets the successful automatic binder is the coming man in the implement business.

The Walter A. Wood Harvester and Binder, under the direction of the Jurors, was started into the wheat and did its work with eminent success. This Company also displayed their chain and sweep-rake machines. Aultman, Miller & Co. then sent into the wheat their Buckeye with the Miller Table Rake, which is well worthy of special mention.

They also exhibited the working qualities of their Buckeye Combined Mower and Reaper. The Champion Mowing Machine Co., Warder, Mitchell & Co. and Whitely, Fassler & Kelly worked a full line of Champion Reapers of all styles and sizes. The Screw Mower and Reaper Co. sent in two Combined machines. McCormick & Co. started off a harvester with self binder, which failed to do its work.

At a subsequent attempt, it did quite as badly, and I hardly think the great father of all the reapers is quite up to the younger members of his implement family in the matter of binders. This firm also exhibited the working of their Harvester and Advance Reaper. The Bradley Mfg. Co. exhibited their new Self Rake Reaper. This implement did excellent work, and nearly every man on the ground spoke well of its work. It is an exceedingly light draft machine and has many novelties in its construction well worth the attention of the harvesting community. The Rochester Agricultural Works sent in two combined machines.

D. McPherson showed a new Binder attached to a Marsh Harvester. It seemed to work with reasonable certainty, and would probably have done much better had it been supplied by a different reaper. The Johnston Harvester Co. exhibited five implements, including their new Iron Harvester and Combined Mower and Reaper. They did good work and seemed to please the Jurors, who followed them with much attention and interest. Of course the Dewey family and the Sherwood family were constantly on hand to forward the interests of the Company.

July 7.

ANOTHER hot day and no Juror, except Mr. Coleman, till 10 o'clock. The representative of Her Britannic Majesty, however, made an early start and went at once to work. The implements were ready, and he went it alone for a couple of hours.

Adriance, Platt & Co. exhibited the Buckeye Combined Sweep Rake. The interest in this machine was in no wise lessened by the presence of our long-time and genial friends Mr. Moffatt and Mr. Brown, both of whom extend their knowledge of men and things way beyond machines to hospitality. C. Aultman & Co. exhibited the same line of implements as those entered by Aultman, Miller & Co., viz., "Good Buckeyes." C. Russell & Co. sent in three Peerless Reapers, of the work of which none could complain. D. M. Osborn & Co. worked a Kirby Reaper, a Wheeler No. 6, and a Wheeler with a Gordon Binder. This Binder did fair work and shows the opening for great improvement. By judicious expenditure of money in experiments and careful calculation, this firm will probably some day produce better results. The Eagle Mower and Reaper Co. put in a Wood's Eagle Self-Rake Reaper which did splendid work. The Jurors are not men to express their opinions upon the ground, but they seemed to be well pleased with this implement, and gave it careful attention and minute examination. It is one well worthy of remark. Edwin Bayliss exhibited a Massilon Harvester providing for two human binders, who were comfortably situated on the machine for binding as the grain came to them. Two men, who were green at the work, were mounted on the machine, and by the excellent arrangement of the apron they were enabled to bind as the machine traveled. This apron is one which can be depended upon always. The Royce Reaper was tried in the field and did fairly; but in the attempt to get light draft the inventor seems to have sacrificed many other qualities very essential to a Reaper.

The last tried was the South Australian Reaper, which was exhibited by Mr. Samuel Davenport, the Commissioner from South Australia, who stated that while he did not intend for an instant to compete with any of our American machines, he simply wanted to show us an implement which is very effective where it is used at home. It was a "header," which partially threshed the grain as it passed through, discharging its load of partially threshed grain every few hundred yards. This was the only foreign implement on the ground, and while it did not accomplish any great results, it excited much interest. If all implements could be exhibited by such courteous and gentlemanly people as Mr. Davenport, it would be a step of progress.

This display was followed by a general exhibition of binders, during which recorded results were substantially repeated. The Harvester Trial then became a thing of the past and went into history.

To close up the exhibition in a becoming manner, a meeting of exhibitors was called, at which a resolution of thanks for careful attention and assiduous labor to Mr. Coleman and his co-jurors was passed, also a similar resolution to Mr. Landreth and Mr. Geddes for their untiring efforts to make the occasion not only a pleasant one, but one at which justice and fairness to all was the special feature. It was then deemed by many present a fitting occasion to organize an Association of Agricultural Implement Manufacturers, and therefore a Committee on Permanent Organization, consisting of Messrs. Whiteley, Bayliss, L. Miller, Moffatt, Kirby and Frank Wood, were appointed. They were instructed to report at an adjourned meeting to be held at the Agricultural Hall, Centennial Exhibition Grounds, on the 26th day of September next. At this meeting it is proposed to form a permanent Association for the purpose of an Annual or Semi-Annual Convention, in which all manufacturers of agricultural implements of any kind are invited to take part. I think this is one of the best movements inaugurated this year. If the preliminary difficulties can be overcome, a valuable organization can be completed, and I should advise every manufacturer to join the movement.

During the day I had the pleasure of a conversation with Dr. Kennedy, President of the Philadelphia Polytechnic School and a member of the Advisory Board of Agriculture at the Centennial. He agrees with my previous opinion in relation to the treatment of the agricultural interests at the Exhibition, and says that, in urging that same position upon the Commissioners, he was met with the astounding proposition that such a course was deemed fair because the rural population were the lightest subscribers to the Centennial stock.

Now, if the subscription to Centennial stock is to be the measure of manhood in that institution, I think your readers may count themselves fortunate that they were the ones. I am free to confess that even with my previous probing of this part of the Great International Exhibition, I was unable heretofore to guess at as contracted an idea as this seems to develop. Truly we live in a broad and liberal age, and the foreign visitors, by measuring the extent of the concessions and spaces at Philadelphia, can easily arrive at the amount of each man's subscription to the Centennial stock. This is a point for me which may be useful in the future. We live but to learn and each day brings its new lesson.

SHORTHORN.

THE WALTER A. WOOD BINDER.

THE first machine started in the Centennial Field Exhibition was the Walter A. Wood Harvester with the Lock Binder attachment. The ordinary harvester carried the grain to the Binder, where it was compressed by two arms and held while a third arm surrounded it with wire, and on its way made a perfect twist knot. In this shape the sheaf was discharged from the machine in good order. The Binder being independent of the rest of the implement, was carried backwards and forwards by a lever in the hands of the driver, so that it was capable of binding the center of the sheaf of the shortest barley equally with the longest rye, and had another lever by which the size of the sheaf is regulated at will.

The whole working of the machine was thrown out of gear by a simple foot lever, and the Binder could be entirely detached from the harvester for transportation without taking out a bolt. It bound both the small sheaf of two or three straws and the largest one ordinarily required. One of the many objections to all binders where wire is used, instead of the grain itself, seems to be the wire in threshing. Mr. LOCK, the inventor, has constructed a pair of shears by which he can, with one hand and one motion, seize, cut and hold the binding wire at the thresher and, feeding a sheaf to the thresher, throw the wire to any required spot or receptacle. This he claims to be entirely unnecessary, as, in his opinion, the wire is no detriment to proper threshing. He has constructed it, as he says, merely to save the trouble of combating the prejudice against the wire. I am informed that the Walter A. Wood Co. have expended a fabulous sum of money in perfecting this Binder, and Mr. Locke says he has now one thousand of them in successful operation in the field.

This Company deserves the greatest credit for their enterprise and farsightedness. I recollect when I was in Rochester, two years and a half ago, seeing this binder on exhibition. At that time I desired to inform the RURAL'S readers of the progress that was being made for their benefit, but was told that the Binder was not yet in a satisfactory condition to be put out to the world, and no special mention could be made of its merits till it had been fully tested and had satisfied its inventor and owners. Since then assiduous labor and lavish expenditure have accomplished much, and now this Company are prepared to put their new Binder to the world as an instrument which *will do its work*. Much credit should be given to men who are willing to take such risks for the benefit of their fellows, and if, in doing good to the world, they profit themselves pecuniarily, who will begrudge them their gain? They have been working quietly but surely, and have not given the results to the public till they themselves were satisfied that they had constructed something which would be a lasting benefit to mankind.

THE MILLER TABLE RAKE.

AMONG the numerous improvements displayed at the Centennial Harvester Exhibition was the Miller Table Rake, manufactured by Aultman, Miller & Co. of Akron, Ohio, and C. Aultman & Co. of Canton, Ohio. It is an implement made upon an entirely different principle from any other now before the public. Attached to the Western Buckeye is a reel which strikes the grain squarely in front of the cutter bar and not diagonally, as in the case of the ordinary reel rake. Upon the table of the machine is a device which revolves horizontally, seizing the gavel, carrying it around the outside of the table and discharging it on a line parallel to the cutter bar. Thus discharged, the grain is not twisted and is compressed ready for binding, with the butts all even. It also has the additional advantage of carrying the grain so gently as to avoid loss, which so frequently occurs with dry grain in ordinary harvesting. The manufacturers claim for it not only light draft and easy adjustment, but the greatest economy in its use in the field. It can be adjusted equally well to high or low stubble, and the results in either case will be equally satisfactory. They have manufactured and sold large numbers of them, notwithstanding the novelty of the implement, and everywhere that it has been used it has given satisfaction. These firms are among the most enterprising in the West, and bid fair to make for themselves and their Table Rakes a success which will be lasting.

Last year this Rake was brought out for the first time and we can, after a year's trial of it, safely repeat what we then said of it: "The Buckeye Reaper, with the newly introduced Miller Table Rake, has surprised even its warmest friends by the excellence of its work in even the most unfavorable circumstances. It picked up lodged and tangled grain and left it in fair condition for binding. The Miller is not a reel rake, and hence works satisfactorily in windy weather."

W. ANSON WOOD'S NEW EAGLE REAPER.

THE new single wheel "Eagle Reaper," of the Eagle Mower and Reaping Machine Co. of Albany, N. Y., made a good showing in the Centennial Field Exhibition. This is a comparatively new machine, and has been in the field for the past three seasons only. Its enterprising manufacturers have already sold over 2,000 this year. The machine is light and compact. It is geared direct from the driving wheel and transfers to the cutting apparatus and rake by the same shaft. The speed is regulated by side pinions, the lifting gear and telling apparatus being controlled by easy reach of the driver. The size of the gavel is regulated by a foot lever.

The rake, patented by Mr. WOOD in Jan., 1875, is automatic, or controlled by the driver at his option. The natural movement of the rake is brought about by an offset from the rake head, the connecting rod being upon an independent center. It clears the drive wheel and gives the requisite speed to the rake and beaters. The Eagle M. & R. M. Co. have a number of their implements on exhibition at T-18, Agricultural Hall.

This implement was obliged to be submitted to the closest scrutiny of the Jurors, who carefully noted its many excellent points and expressed by their manner a thorough satisfaction as to its working qualities. It was so easily handled that no defect could escape notice, had there been any, and we anticipate that the Jury will report upon it in such a way that the manufacturers will congratulate themselves upon having put themselves to the trouble and expense of making this exhibition.

Scientific and Useful.

BETTER THAN PARIS-GREEN.

FARMER KENT has 1½ acres of potatoes. He uses a shingle about 16 inches long and 5 inches broad, narrowed at one end to suit the hand. Sometimes he uses a whisk-broom, which answers the purpose just as well, being light and broad. With these, two men get over the potato patch in one day. The plant is struck on one side with the shingle or broom, and the beetles fall off into shallow, wide tin pans held in the left hand. During last week one bushel of beetles were in this way collected as the result of one day's labor of two men. Farmer KENT prefers this method of extermination to the use of Paris green.

ELASTIC VARNISH.

As an excellent and easily manufactured varnish for wicker-work, Mr. F. Rhein recommends the following composition:—One part of good linseed oil boiled down to a sirupy consistency, and mixed with twenty parts of copal. This mass is then diluted with oil of turpentine to the proper thickness. The varnish dries easily, and remains elastic, so as not to crack by the bending of the basket.

SMELL OF PAINT.—To get rid of the smell of oil paint plunge a handful of hay into a pailful of water and let it stand in the room newly painted.

The Garden.

THE PEST OF THE HENERY.

We believe that most of the ills with which hens are afflicted are caused by lice, and that if the houses were periodically whitewashed and the nests sprinkled with sulphur, snuff, tobacco, ashes, hellebore or any other substance distasteful to these vermin and harmless to the hens, diseases would prove the rare exception and not the rule. The rule is for farmers to neglect their hens until they are stupid with lice, and go about with their feathers ruffled up as if it were, as, indeed, probably it is, misery to move, before any measures of relief are deemed necessary. The old adage that prevention is better than cure, or, a stitch in time, etc., is here especially applicable. It is an easy matter to prevent lice, but a very difficult matter to exterminate them. Even when by the use of insecticides and other applications the hens are somewhat relieved, constant care is afterwards requisite to prevent, by the rapid increase of the vermin that remain, the return of consequent disorders.

Poultry alive with vermin are pitiful sights, and reflect anything but credit upon those whose duty it is to look after them. The chicks raised by unclean mothers suffer from the day of their birth till that of their death. They are never sprightly and healthy; they are always the first to be taken down with the prevailing endemic or epidemic; they, therefore, need a great deal more care and, finally, are less profitable than those which live in clean houses and lay and sit in tidy nests. The question as to whether hens will thrive when shut up, and the subsidiary one as to how many may be confined in a given space, cannot be answered except, in the experiments, the hens be kept pure—for freedom, to infested fowls, is their sole chance of life.

The writer confined from nine to sixteen hens in a city enclosure, twenty by four, (80 sq. ft.) for two years without the loss of a hen and with very little sickness. The house was six by four, ventilated at the bottom only and otherwise closely boarded, securing warmth in winter and, sheltered from the sun by a grape vine, comparative coolness in summer. The rest of the enclosure was lath. From four to six inches of gravelly sand was given every two or three weeks and the old removed. Grass was given as often as it could be cut from a small grass-plot. Raw meat was given twice a week. Burnt clam shells, ashes and lime were given as often as convenient, though not as often as required. The house was often whitewashed—the material of the nests frequently changed and the nests dusted with sulphur. They were fed upon the scrapings of the table—wheat, corn, oats. Water was given daily and oftener during hot weather.

An account was kept of the cost of these hens for the first year and the value of their eggs. We have lost this account, and can only state our impression that it proved that hens *can* be confined and remain healthy too, and that they can be made profitable even in cities.

We suggest to those who have lousy hens and chickens to part with every one of them, and to thoroughly cleanse the houses and yards in every part, and begin with a fresh pure lot. Those who have had to do with poultry all their lives may deem this shallow advice; but we know from what we see that these shiftless, untidy, unkind modes of keeping fowls are handed down from father to son, and that many farmers do not ever give a serious thought to persistent cleanliness. Hens will, in a manner, "take care of themselves," and so in a large majority of cases they are left to do. But the plan, viewed with an eye to profit, is "a penny wise and a pound foolish," and, viewed with any other eye, it is a cruelty to animals.

WHAT TO DO WITH NON-HEADING CABBAGES.

A writer in the American Agriculturist says: Last fall I was mourning over an unusual number of half developed cabbages, which were only fit to be fed to the cows, and mentioned the fact to a Dutchess Co. farmer, who is in business in New York, and has lately bought a farm near us, asking if his crop turned out badly. His answer was, that he had no more soft heads than he wanted, or to effect that he would feel disappointed if he had not a considerable number. Now we, neither of us, raise cabbages for market, but for our own consumption mainly, and I was utterly at a loss to know what he could do with a quarter of his crops that failed to make heads.

He told me that he dug a wide trench, so deep that after some top soil was thrown in he could set the cabbages out in the trench as close as they could stand, and their heads would not come up level with the top of the ground. When planted, he covers the board with boards and some brush, corn-stalks, salt-hay and earth on the top, keeping it open at the ends or elsewhere until cold weather and then covering it in close, He said they would all have firm, solid heads in the spring.

I tried it, and at the time I write (April) we are enjoying the best cabbages we ever ate. They are rather small to be marketable, say 4½ to 6 inches in diameter, solid and sound, crisp and tender, as delicate as cauliflowers, and what is more remarkable, I never know when we are going to have cabbage for dinner until I see it upon the table. The great objection I have to this most wholesome and delicious vegetable is, that it usually fills the house with its perfectly detestable odor, so to have cabbage without this drawback is worth all the trouble it costs. If these winter-headed cabbages could once become known in the market, I am confident that their merits would command for them a ready sale all through the spring. The cabbages in market at this season are very poor. They are very apt to be slightly decayed, will keep but a little while, as they wilt at once, and soon after rot. I wish now that I had enough to test the market with, but I have not, and write this partly in the hope, that somebody will do it next year.

GARDEN NOTES.

Pruning Melon Vines.—Few persons practice pruning cucumber, melon and other similiar kinds of vines, still it is just as beneficial if properly done as the annual prunings of the grape and other woody plants. The pruning should be confined, however, to the pinching off of the ends of shoots only.

Parsley-seed that has been kept several years comes up sooner then new seed; unless, indeed, the new seed has been taken from the plant before it was fully ripe, and sown immediately.

The Poultry Yard.

TRANSPLANTING VEGETABLES.

During the month of July, farmers and gardeners in the Northern States either sow the seeds or transplant many kinds of late vegetables. The operation is always more or less precarious, on account of the great heat at this season and the infrequency of showers. Cabbages, beets, turnips, celery and similar vegetable plants are generally removed from seed-beds at this season, and although not difficult to make live, still a certain amount of care is required to prevent severely checking their growth. Of course everyone will try to select a moist, cloudy day in which to transplant, but this cannot always be had, and as the operation cannot be delayed beyond a certain period, other precautionary measures must frequently be adopted. If rains do not come, then prepare the ground in the best possible manner, and by frequent stirring and deep culture, a moderate supply of moisture can be secured even during a severe drouth. Soil stirred in the evening will usually absorb from the air and retain considerable moisture, while land not moved will become as dry as powder.

When further delay in transplanting is likely to endanger the crop, give the plants as they stand in the seed-bed a thorough soaking with water. Then in a pail, half barrel or other water-tight vessel, or even a hole in the ground will answer, fill with water and mix in a quantity of rich unctious earth of a clayey nature, until it is of the consistency of thin mortar. Now lift the plants carefully, remove two or more of the larger leaves by pinching off with thumb and finger, and when a handful is thus prepared, dip the roots in the mud, or puddle, as usually termed. If the puddle is of proper consistency, the roots will be entirely coated over and excluded from the air, which, of course, prevents wilting for a time. The removal of two or three of the largest leaves also assist greatly, as it checks the rapid evaporation of the moisture of the plants, and the effect is the same as removing a portion of the branches of trees when transplanted.

This preparation of the plants may be done during the day, and even twenty-four or more hours previous to setting out, if more convenient, provided they are put in boxes and set in a shady place. Just at night or late in the afternoon is the best time to set out plants in a dry time, because, during the few hours of shade which follows, the roots will, in a measure, become fixed in the earth and be all the better prepared to withstand the call upon them for moisture by the leaves during the following day.

In transplanting it is always safe to set a little deeper than when the plants were growing in the seed-beds, and pack the earth very firmly about the roots. If cutworms are likely to trouble the plants, inclose each stem in a small slip of paper, passing an inch below and to the first leaves above the ground. Common brown wrapping paper is best for this purpose, but old newspaper will answer, and if cut up into pieces of the required form and size, the slips can be put on very rapidly, and will cost less than filling up vacant spaces caused by cutworms or replanting an entire field, as is often necessary where these worms are very abundant. In setting out cotton and tobacco plants, the paper protectors may often be employed to great advantage, especially where the common surface cutworms are plentiful. The climbing cutworms will crawl over and above the paper bands, unless smeared on the outside with some obnoxious substance.

After plants are set out, the frequent stirring of the soil must be continued, if the weather remains dry, and in hot weather it will do no harm and much good. A little care in these matters will usually prevent a failure, even during unpropitious weather.

PLUCKING FOWLS ALIVE.

Among the "Rural Brevities" in the Rural is an extract from "Our Dumb Animals," to which is added the wish that the fine had been double that imposed.

Plucking fowls alive is in the opinion of every right-thinking man a cruel, unfeeling act; but there are many people wicked enough, notwithstanding the protests of those who are more humane, to persist in the horrid practice every year. In all the former Slave States the custom was, and still is, almost universal, the negroes having been taught by their owners before their freedom to do it on their own account, and the planters have it done as heretofore, some of them as often as three times in a year. It makes one's flesh crawl to see the poor, ragged animals moping around after the operation!

The former slave owners are not the only people in this country, however, who practice this outrageous custom. There is a race who complain of being trodden under foot and plucked of every right of freedom at home who on coming to this country soon become the owners of poultry and pull the feathers from the poor creatures while alive.

Putting aside the contemptible cupidity of those who strip the feathers from poultry for the sake of the trifle they are worth, it is a most foolish practice. I never yet saw any nice flocks of geese or ducks which raised young and paid well when plucked, whereas where the geese are not plucked there will be so many goslings raised to geese that the feathers plucked from them after death amount to many more than could have been had by plucking live ones.

Avarice in this case overreaches itself, and any one of observation can see this assertion fully verified in the South, where there are as many ganders as geese kept, and where, also, the people won't believe that a gander will take to and sire goslings from more than one goose.

This most barbarous custom was stopped in England before I left there, but here the Society for the Prevention of Cruelty to Animals confines its action to cities, allowing the country to commit ten times the cruelty perpetrated in places where so many eyes are watching.

On page 407 you have an article in regard to the "Raising of Pekin Ducks." Any other kind of ducks may be raised by placing them where they can have easy access to a vessel of water let into the ground and a stone or stones put in, so that they may get out whenever they wish, and feeding them with a little meal, wetted. It is also better to allow them full liberty to follow their mother, or placed so they can land, having their foster mother (the hen) around to pick up worms and other slugs in ditches or puddles.

Our ducks, turkeys and chickens never did better than this year. They are taken away from the regular run of the old fowls when hatched and placed with their mother on the edge of a belt of trees, the coops being under the trees and the hen having liberty after the first day, but being inside the coop at night.

A Working Farmer.

CARE AND FEED OF FOWLS IN SUMMER.

We have at this season to consider the feed for our fowls. Corn is usually the standard with farmers and amateurs. I like it in cold weather, but in warm weather I cannot get as many eggs by its use as I can with wheat, wheat bran, or even oats.

Wheat is splendid feed at any season. I have often found that when I had fed wheat for some time and began to feed corn again that the chickens would, after picking a few grains, stop and come up to me, and when I went to the next yard they would follow to the gate, as if they wanted something else.

Oats make a fair summer feed, and are worth per bushel, perhaps, half as much as wheat. Wheat screenings, when from a merchant mill making a crack article of flour, are worth all they cost, but those from custom mills are not usually of much value.

Barley is invaluable for fattening fowls, those fed on it readily bringing 2 to 5 cents per pound more than those fattened on corn. It is, however, open to the same objections as corn as a summer feed.

Wheat bran is a fine summer feed, and if one can get that from which but one grade of middlings has been taken, it is the more valuable.

Corn and oat meal, mixed, takes the place of corn meal as a feed for young chickens and other young fowl.

But the feed which we prefer to all others is as follows:—Boil two bushels of potatoes in a barrel kettle, and when the potatoes are done so as to crush easily, mash them well and add 40 pounds of bran and 20 of mixed corn and oat meal. The heat of the potatoes will cook the meal and bran well, and when cold it will cut like mush. It is the best possible feed for young fowls, and for old ones also.

Turnips may take the place of potatoes, and any medicine or stimulant required may be put in it. I usually give red pepper once a month in winter, and oftener if they flag in laying.

A. M. Van Auken.

The Naturalist.

THE LATEST IDEA IN PETS.

A MUD TURTLE WADDLES ROUND AFTER A LITTLE GIRL.

A lady, writing to the Arcadian, relates the following regarding one of the oddest pets that ever existed, and which belonged to a little girl of her acquaintance: A visitor met this little girl at the gate last summer with what she supposed was a lunch box under her arm. To the lady's surprise a snake-like head ran out a little way from the lunch box, and the pet turned out to be a common mud turtle. Some one had brought the creature home a year or so before and let it loose in the garden.

When the children began to play there, out from its hole came the turtle, and singling out this child gave evidence of intelligence beyond belief.

The turtle was called Pedro, and the little girl had but to call that name two or three times at the back door to see the old box waddling up from the bottom of the garden directly. Any one else approaching or attempting familiarities, the clumsy feet were drawn promptly in and the wise old head retired within its shell, and no sign of life would Pedro give.

But let the child take it, the claws closed round one of her fingers, and the head, run out to its fullest extent of neck, would be waggled against her with every token of love a turtle could give.

There came a time during the summer when the little mistress was sick. The mother, sitting in the dusk, thought she saw a dark object moving in the room, and shortly after, hearing a bumping on the stairs, went out and found out it was Pedro returning to his hole in the yard

Each day for weeks, with the opening of the outside door, in would walk Pedro. The girl generally found him waiting on the steps.

He would go to the stairs, stand upright in a corner, and setting his little feet into the stair above, pull himself up. This operation he would repeat until he reached the landing. If the door into the sick child's room was closed he waited patiently to be allowed to enter.

When taken up and laid beside its mistress it made no effort to move, but lay for hours with its solemn head wagging from side to side.

At night it waddled off to the stairs, and then the racket commenced. As it fell off each step in clumsy fashion it sounded like that famous clock in the Ingolsby legends that went hopping after Mr. Ap. Jones.

THE CROW—THE FARMER'S FRIEND.

The following from Our Dumb Animals, is quite in accordance with our own experience with the every abused crow.

The poor crow finds every man's hand against him, notwithstanding the service he does to those who till the ground. If they do not kill him on sight, it is only because he is usually a match for even the most sharp-sighted gunner. He is quite as fond of bugs and worms, and little field mice and young snakes, as he is of the farmer's corn. He is a good policeman about the farm-house and drives away the hawk, who can do twice the amount of mischief *he* is guilty of. He hunts the grass fields and pulls out the caterpillars and all manner of pests, and probably saves many other crops, if he is hard on the corn.

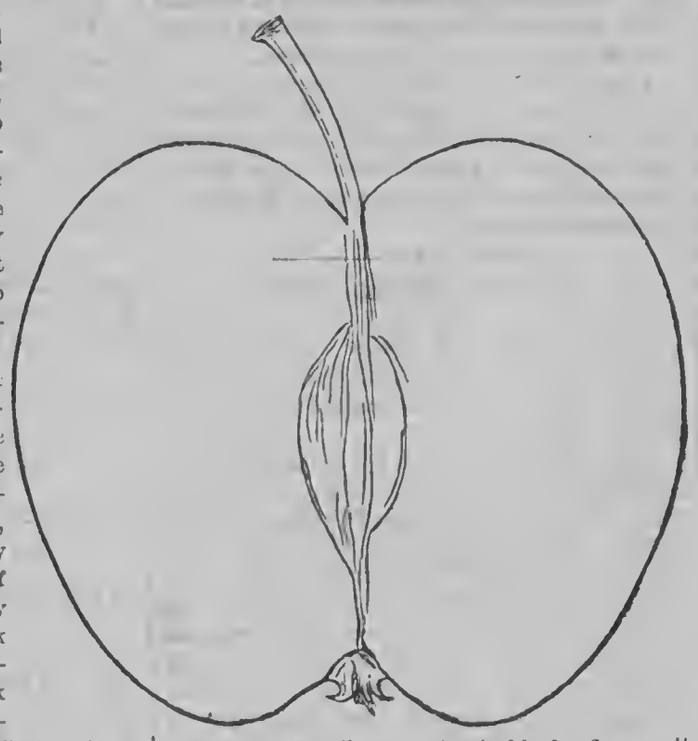
A gentleman had a tame crow who trotted out after him as he went out to wage his annual war on the squash bugs. His sable attendant put his head on one side and watched him a few minutes, as if to see how he did it. Comprehending the business at last, he went for those bugs with a will, and cleared the patch in fine style. He took it for a business the remainder of the season, insuring a fine crop.

The late wonderful shower of meat in Kentucky was, it is affirmed, real meat after all.

Pomological.

BRITTLE SWEET APPLE.

Sweet apples are not general favorites among our people, still those who do like sweet sorts want the very best which can be had. Of course we expect that there will be a difference of opinion on this point, and some will call a juicy, moderately sweet apple superior to one containing a great deal of saccharine matter, but rather dry. The Brittle Sweet, of which we give the accompanying outline, is but slightly known, but is such an excellent sort that some of our readers may wish to give it a trial, hence our calling attention to it at this time.



Its origin is unknown. The tree is moderately vigorous and very productive. It is, however, one of the best in cultivation. Fruit above medium, roundish, approaching conical. Color, pale yellow, shaded, splashed and marbled over nearly the entire surface, with shades of light and dark crimson red, many small gray and white dots. Stalk rather short, slender. Cavity regular, broad, moderately deep. Calyx closed. Segments small, often recurved. Basin small corrugated. Flesh yellowish, crisp, tender, juicy, with a peculiar honeyed sweet, and slightly aromatic. Core rather large. Very good. October and November.

FIG AND ALMOND CULTURE.

The cultivation of the various fruits adapted to the climate of the Northern States have been extended until our markets are fully supplied with all, very few if any being imported. But the same cannot be said of the Southern States, for although the climate seems to be especially adapted to the culture of the fig, almond, orange, lemon and other tropical fruits, still we look in the main to foreign countries for a supply.

Why should we import millions of dollars worth of figs, and almonds, while the Southern States could readily supply our markets? Is it for the want of a proper knowledge of their culture and lack of energy or scarcity of labor? Of course it is not for us up here in the North to answer these questions, as apples, peaches, pears and similar fruits mainly occupy our attention. But it does seem to us that the people of the Southern States ought to be able to supply us with such easily grown fruits as figs and almonds, as cheaply as they can be purchased abroad counting in the cost of exchange, freight, insurance and other unavoidable expenses.

THE ALMOND.

Some of the varieties of the almond succeed near y as far north as the most hardy sorts of the peach, but these are rather inferior, besides there is really no certainty of obtaining a crop. The finest sorts like the Long Hard-shelled and Ladies Thin-shelled are rather tender and can only be depended upon in warmer climate, say from North Carolina and southward.

These varieties are as readily propagated and cultivated as the peach, and the trees are not only quite similar but are liable to the attacks of the same diseases and insect enemies. A warm dry soil is best, and if quite rich so much the better, not only for securing a good crop of fruit but long life to the trees.

The finer varieties, such as we have named above, may be propagated by budding upon seedling almond stocks, or upon the peach and plum, the latter being preferable in localities where the peach-tree borer abounds. The plum stock however has a tendency to make the trees somewhat dwarfish, in habit, but this is not objectionable so long as the vigor and productiveness of the tree is not impared by its use.

When the almond is ripe the flesh or pulpy covering of the nut dries and cracks open permitting the former to drop out. A man who raises almonds is not obliged to send them forward to market on a certain day, as with peaches, else lose his crop, but they can be gathered and held for weeks or months if necessary in order to secure a good price, and this is an advantage which should tend to increase their culture, especially in localities not contiguous togood facilities for reaching the markets in our larger cities.

THE FIG.

This is another fruit especially adapted to the climate of the Southern States, and of which large quantities are imported from foreign countries.

There are many varieties, some of which grow to twenty or thirty feet high, others are mere low spreading bushes. They are all readily propagated from cuttings of the shoots or roots, planted in a warm situation either out of doors or in a hot bed. The young plants when one or two years old, should be set out ten to fifteen feet apart according to the habit of the variety, and in a good rich soil, as the fig is a rank grower and gross feeder and it would be difficult to make the soil too deep or too rich. Good after culture is also required, and if the soil is naturally porous mulching should be applied in spring to prevent the trees suffering from drouth.

Low, moist soils are not suitable for figs, as it encourages late growth in Autumn and the frosts of winter destroy the young immature shoots. Pinching off the ends of the young shoots in summer is as beneficial to the fig as the grape as it hastens the maturing of the wood and increases the size of the fruit.

Figs are consumed but sparingly in their natural state in this country, but are dried and packed away for use later in the season, or sent to market.

There are various methods of drying figs; those coming to our markets from foreign countries are dipped in hot lye and then dried on frames in the sun, after which they are packed in boxes, or baskets made for the purpose. A better way to prepare figs is to let them remain on the trees until thoroughly ripe, then gather and immerse them in hot or boiling syrups made of clean white sugar for five or ten minutes, take out and dry in an oven or fruit drying kiln. If prepared in this way they will not be so likely to be infected with insects as when dried in the sun. There are dozens of excellent varieties of the fig propagated by our nurserymen both north and south the descriptions of which can be found in their catalogue. As the fig tree does not ripen its fruit all at one time the drying may be continued through several weeks or months, and there need be no hurrying to gather the crop, nor in sending it forward to market, hence like the almond its culture is peculiarly adapted to the needs of those residing away from our principal thoroughfares of the Southern States.

The Vineyard.

THE STOPPPING OF GRAPE VINES.

The readers of the Rural New-Yorker are probably aware that we believe in thorough and scientific pruning of plants as well as thorough culture of the soil in which they are growing. Therefore it is not strange that the following article which appeared in a late issue of the Farmer, (Eng.) should attract our attention.

It has been said that the highest art of good writing or speaking is that of knowing when and how to stop. Be that as it may, assuredly the skillful stopping of grape vines is a most important feature in their successful cultivation. And notwithstanding all that has been written on the subject, there are yet those who do not know what it means, and many more who do not understand how to do it. This paper will be devoted to the attempt of making the matter clear to both. To stop is to stand still. Animal life may do this voluntarily, vegetable life or growth cannot be arrested during its progress without compulsion. Hence, the stopping of grape vines implies the application of force. Force is of many kinds, moral, mental, physical. The first is an affair of motives, the second of reason and the third of force. And it is only the last that can be applied to vegetable life and growth. A man walks or runs, he stops, that is, he ceases to move; the act is voluntary. A horse runs away, the driver pulls it up; the animal stops by compulsion. The stoppage is as complete and perfect as before. This is analogous to the training of a shoot. It is pulled up, stopped from going further in one direction that it may be trained or led in another. A hare bounds across the mead, the sportsman fired at its head, it stops—a mutilated thing; in can go no further minus its head, or with a wounded one. The last is the nearest illustration to the stopping of grape vines. It is, in fact, a forcible stoppage by the removal of the head of each shoot or growing branch.

Stopping being then, the removal of the heads of the growing shoots, the next step is to determine what shoots are to be stopped, and to what extent this beheading should be carried.

The leading shoots of vines, as a rule, are not stopped. These shoots may be one or many, according to the system of training adopted. On the restrictive mode of training—that is one root and one rod, or one vine plant to each rafter—there is but one leading shoot. The highest branch on the vine is led on further to furnish more ground, until the vine reaches from the wallplates to the roof of the house. Even after all the rafters and roof area are furnished, these leading shoots are generally encouraged to grow freely for a time without stopping, and to run down the back wall or anywhere. A free growth ahead is useful in developing new and strong roots at bottom, and in bringing up a full and vigorous current of nourishing fluid to the whole of the fruit-bearing branches and leaves of vine plants. Hence, chiefly, the reason why the leading shoot or shoots are, as a rule allowed to run on without stopping. Occasionally, however, they are stopped to gain additional strength or compactness of growth. But this is so different to what is generally meant by the stopping of grape vines, that it will be better, for the sake of lucidity, not to confound it with it.

Of course, too, vines trained on the extensive system—that is, one vine for two or more rafters, for the half or the whole of a house—have many leading shoots, all of which should be treated in the same way as the one leader of the restricted vines—that is, allowed to run on without stopping, for the good of the plant or the providing of new wood for the fuller furnishing of the house. But all the side shoots or fruiting branches should be stopped a leaf or joint in advance of the bunch of fruit. The bunches shew at different distances from the main stem of the vines, from two to five leaves from the base of the current year's shoots; the bunches are first developed. As soon as a leaf is produced beyond the bunch, the head of the shoot should be stopped short. This is generally done with finger and thumb. the young shoot being brittle and easily removed by a pinch; or a sharp knife may be used, the latter, however, being seldom employed by professional gardeners.

This beheading of the fruit-bearing branches a leaf in advance of the bunch, is the first and chief stopping, and may be generally called the stop. It arrests every growing branch, and throws back its strength on itself. It is held to add to the vigor and size of the bunch, as well as the fineness of the foliage. But, of course, growth is irrepressible, and though thus easily stopped for a time by the removal of its growing points, it soon starts again and grows afresh. These fresh growths involve the necessity for fresh stoppings. It thus happens that the stopping of grape vines becomes a process rather than a single act. The simplest mode of stopping is to make it periodical, say, once a fortnight or three weeks throughout the growing season. By thus overhauling growth at regular intervals, the vines have no time to run into wilderness or confusion, and there is also less waste of growing strength.

The method of future stopping are varied by circumstances. Some leave an additional leaf at each futher stopping, as long as room can be found for them. It is safe and good practice to leave a few more leaves. If all subsequent stoppings are carried right back to the point of the first or primary one, the buds between the bunch and the base of the shoots are apt to burst into growth, and if this breaking extends through all the buds, the finest for fruiting next year may be sacrificed by excessive repression now. But a few more leaves left to develop beyond the first stop will generally prevent this, and may also furnish a useful stock of leaf force in close proximity to the bunch of grapes.

But in almost all cases some of the buds between the bunch may break into growth. These must then be also stopped short back to the bottom bud, or to the leaf on the bearing shoots. Summer pruning should in fact be prevented by constant stopping, which may be defined as a skillful device for the prevention of pruning by arresting superfluous growth almost before it is made. The more skillfully stopping is performed the less superfluous growth will there be to remove.

By persistently stopping back to a leaf or two in advance of the bunch, all overcrowding of the foliage is prevented, and only as many fine leaves are retained as can be fully exposed to light and air. One fine vine leaf, with room enough to perform its functions, is worth a dozen or more of small leaves crowded together. In fact, proper stopping concentrates growing force into fewer channels, and so adds as it were momentum to its power. It is the fine foliage that lays the germs of fine bunches and also feeds them with better and more for food. The buds on the base bear a close relation to the leaves in size and vigor. And it is not too much to say that the bunches of the one year are the products of the leaves of the preceding one.

In the process of stopping all tendrils should also be removed from vines. As under cultivation vines are generally tied in position and supported by artificial means, it is alike a waste of force and material to allow them also to manufacture their own ties in the form of tendrils. Those produced on the bunches should be removed at the earliest moment; and if stopping is commenced in time and persistently prosecuted throughout the season, there will be a few tendrils developed, for the points moved will also include most of the tendrils.

Arboricultural.

TREE PLANTING IN CALIFORNIA.

In California everything is done on a large scale if at all. Grape vines are planted by the hundreds of thousands and wheat fields extend to thousands of acres, and their groves of forest trees are what in the East would be called extensive forests.

Of late Californians have commenced the planting of forest trees and this too, upon the same extended scale which marks all their operations. The Blue Gum tree at present being a general favorite, we are given an inkling of the manner of handling this tree in a late number of the Los Angeles Express.

On the Laguna ranch, seven miles from Los Angeles, Mr. H. H. Spencer contracted with Col. R. S. Baker to plant 75,000 Blue Gum (or Eucalyptus) trees in a field of a 100 acres. Mr. Spencer secured a large quantity of seed from Australia, and planted it in boxes at his place on Hill street. As soon as the plants began to shoot he transferred them to other boxes, placing them in exact and equal distant rows, with a view to transplanting them in the ground as he is now doing. Mr. Spencer invented a machine by which the tree is lifted from the box, with all the earth surrounding it, and injected as it were, into a hole made by a similar machine in the ground where it is to grow.

Mr. Spencer's contract with Col. Baker requires him to plant 75,000 trees. The ground was first plowed and then rolled. Five wells were sunk, one at each corner of the field and a large one in the center. These are supplied with force pumps by which the water is raised into tanks. A fine quality of water is struck in each of these wells at a distance of about three feet from the surface. The grove is laid out with drives from the entrance, facing the county road, to each of the wells on the boundaries, and these are connected with avenues converging to the large central well. An open circle, about 120 feet in diameter, is left at this well, where the Colonel intends to lay out arbors and grounds for picnics, etc.

HOW THE WORK IS DONE.

The trees are planted in rows running paralled with the county road. They are laid out in quincuncial rows, each quincunx of trees occupying a square of 12 feet. Thus a line 252 feet in length, marked out every 12 feet, is stretched and fastened to pegs. Men with spades then dip out a gutter of earth and sink a cross cut two inches from the line. This marks the exact spot where the tree is to be planted. Men then come along armed with the planting machines. They first take out a plug of earth about six inches deep and an inch and a half in width, with one of the machines which is without a tree; then they insert a planter containing a tree into the hole, push down the cylinder with the thumb, and presto, the tree is adjusted in its place. Then follows a man with a heavy cast iron pounder, opened in the center and rounded at the end to a convex shape. The tree passes through the central apertire, the pounder is pressed to the earth, and when withdrawn the dirt is closely packed around the plant and left in the shape of a bowl. Then a man comes along with water and fills the bowl. Some time afterwards dry sand is spread over the moisture surrounding the plant, and it is thus preserved from insects, which will not remain in dry sand, while the process of evaporation is retarded by this surface layer. We timed the men while they were planting a line of trees, and find that it took them just one minute and a half. At this rate they can plant 6,300 trees a day—that is, a gang of men consisting of 17, engaged immediately and incidentially in the work. The average is about 6,000 trees per day for such a force so that from the time of getting fairly at work it would take about 13 days to plant the 75,000 trees contracted for. There are portions of the field where the process of planting is not so easy as in that we have described. At some points the earth is baked almost hard to a considerable depth. Here

AUGUR HOLES ARE BORED.

By men with the Champion posthole auger, to a depth of about two feet, where moist soil is met. This hole is filled with water from carts that are kept constantly moving between the tanks and the holes. The water soon softens the walls of the holes and disappears. They are then filled with a fine loam, and in this the trees are planted. This portion of the work is slower than any other, but a large gang of men are employed with augurs and rapid progress is being made.

Mr. Spencer took us to portions of the field where trees had been planted over a week, and we found them getting along vigorously.

Hygienic Information.

ABOUT SNEEZING.

There is no good reason why a sneeze may not be a good or bad omen as well as many other signs in which a large number of persons put more or less faith. The Cornhill Magazine sums up the sneezing question pretty thoroughly as follows:

The belief in evil spirits affords the best explanation for a set of customs no less curious than disagreeable and ridiculous. We allude to the world-wide superstitions connected with spitting and sneezing. Many Englishmen spit if they meet a white horse, a squinting man, or a single magpie, or if inadvertantly they step upon a ladder or wash their hands in the same basin with a friend. In Lancashire boys spit over their fingers before beginning to fight; travelers on leaving home spit on a stone and throw it away; market people spit on the first money they receive in the day. Swedish people spit thrice if they cross the water after dark, and even the esthetic Athenian used to spit if he met a madman. So the savage New Zealand priest spits on two sticks, which according as one of them falls uppermost are to foreshadow the result of a coming battle. Indeed, this unpleasant habit seems a universal charm for bringing good luck or for averting bad; but for what conceivable reason than that the mouth was once regarded as the portal by which evil spirits got into a man and by which alone they could be forced to make their exit. The Messalians used to make spitting and nose blowing a part of their religion, for they hoped thereby to free themselves from the demons with which they fancied the air to be full. This single case contains, probably, the key to all the others.

But why should sneezing be so generally regarded as a bad omen, and one to be averted if possible by felicitations and blessings? One explanation is, that as it was the sign of returning convalescence during the plague at Athens, congratulations were offered when the crisis was past; another, that during a great plague which raged in Germany in the sixth century, and began its fatal course with a fit of sneezing, it was usual to exclaim, "May God help you now," as soon as the sad death signal was heard. But the custom is of far wider extent and older lineage than such explanations imply; and the only possible hypothesis is one that adapts itself to all races and all times. In New Zealand a mother repeats a charm when her child sneezes, lest any evil result in consequence, and English nurses do just the same. In the Netherlands a sneeze gives a witch power over a person, unless some one invokes a blessing from heaven, and in these facts probably lies the real explanation. For, taking into account that every bodily derangement is regarded by savages as possession by evil spirits, and that sneezing is always the precursor of those temporary bodily derangements, often very severe, which we know as "colds," may it not be that in those early times, when to precede is the same as to cause, a sneezing fit was set down as the sign or cause of such an approaching possession, and charms employed to counteract its effects?

If a cold was ever held to be a bewitchment, we can understand the use of charms and blessings at the earliest stage of the premonitory symptoms. As an involuntary act a sneeze would, like all other natural phenomena, be a portent significant of, and entailing a series of consequences; and in course of time, as men improved in observation and distinctions, it would grow to be even auspicious under certain circumstances. Thus in our own country it is a good sign on some days of the week, but a bad one on others; and in Scotland an infant is under fairy spells until it sneezes, a belief as apparently connected with the absurd idea of the incapacity of idiots to sneeze.

In Greece, also, the distinctions drawn about it raised sneezing to an art; for while it was unlucky in the afternoon, or when food was being cleared away, or if it occurred three times, or more than four, or on the left-hand side; if it occurred among persons of deliberation, or two or four times, or in the morning, or on the right-hand side, it was accounted a lucky omen. We read that Themistocles, by a judicious sneeze on the right-hand side, persuaded his soldiers to fight, and Xenophon, by a similar act in the middle of a speech, was elected general. And on another occasion a sneeze from a linesman just before a battle was considered so ominous that public prayers were deemed necessary in consequence.

FRUIT AS FOOD.

Dr. M. L. Holbrook a good while ago in speaking of Fruit as Food said: There is one other value in fruit which I cannot pass over in this connection without notice. One of the common diseases of children is worms in the bowels. If a child's digestion become impaired and the gastric juice become weakened or defective in quantity by overeating or bad food, the whole alimentary canal becomes clogged up and filthy, and furnishes nests for such worms as will breed there. In this weakened condition of the system, they cannot be destroyed by the process of digestion, and hence great harm comes from them. Now, it is an interesting fact that fresh ripe fruit is the best preventive for this state of things. Dr. Benjamin Rush pointed this out a hundred years ago. He made a series of experiments on earth worms, which he regarded as more nearly allied to those that infest the bowels of children than any other, with a view to test their power of retaining life under the influence of various substances that might be used as worm medicines. The results proved that worms often lived longer in those substances known as poisonous than in some of the most harmless articles of food. For instance, in watery solutions of opium they lived eleven minutes; in infusion of pink root, thirty-three minutes; in claret wine, ten minutes; but in the juice of red cherries they died in six minutes; black cherries, in five minutes; red currants, in three minutes; gooseberries, in four minutes; whortleberries, in seven minutes; and raspberries, in five minutes.

From these experiments Dr. Rush argued that fresh, ripe fruits, of which children are very fond, are the most speedy and effectual poisons for worms. In practice this theory has proved to be correct.

If we eat and drink hot and exciting materials the blood becomes inflamed, the nerves exasperated, and the brain sends out thoughts that are base and mean. If we would do away with those foods that only influence the passions, and substitute more fruit in their place, we would need less restraint on wrong doers, for our heads would be clearer, our blood cooler, our nerves steadier, our impulses more subject to reason, and life would be a hundred per cent. truer and better than it is to-day.

The above is timely and, we believe, good advice.

INDIAN CORN AS FOOD.

No one doubts the value of Indian corn as food for man and certain kinds of animals, but we have long noticed that our Hygienic authorities seem to forget that "what is meat for one person may be poison for another," therefore it is not every healthy laborer who can eat corn or corn meal no matter how scientifically it is prepared, without ill-effects. It may be rich and nutritious as claimed by our most celebrated chemists, and so are peas, beans, pork, or the blubber of the whale, but it does not follow that everybody, or under all circumstances such kinds of food may be consumed with impunity. A late writer in the Journal of Chemistry, says:

"Indian corn is one of the most important and healthy articles of human food that a beneficent Providence has bestowed upon man; and to its high nutritive value is due in a large degree the strength and vigor of the race of men who laid the foundation of this great republic. It was much more largely used fifty or one hundred years ago than now, as fine wheat flour, for some not well-founded reason, has usurped its place in bread-making. In the several forms, however, of hulled corn, popped corn, hominy, samp, corn starch, maizena, etc., vast quantities are consumed by all classes of people."

But can the writer of the above show us that the first or second generation of Englishmen who landed upon our shores and fed upon Indian corn were any stronger or longer lived than their grandfathers? Or are our corn-fed people of to day more vigorous, healthy or likely to be longer lived than those who eat no corn on this or the other side of the Atlantic?

If corn is not as extensively used now as it was "fifty or one hundred years ago" the change has probably been made for good and sufficient reasons, and among them the fact that our people can get something which they like better, just as the ancient Britons gave up their acorn bread as soon as there was wheat, barley and other kinds of grains produced in sufficient quantities to supply their wants.

As to the palatableness of, and nutritious properties of corn, as claimed by the writer referred to above, we agree with him, provided a person likes this kind of food, and the stomach readily assimilates it for the proper nourishment of the body. He says:

Meal from Indian corn contains more than four times as much oleaginous matter as wheat flour, more starch, and nearly as much nitrogenous material; consequently in all cold climates it is admirably adapted to sustain the system by furnishing heat-forming compounds. The oil gives warmth, the nitrogenous principle gives muscular strength. The combination of elementary compounds in Indian corn renders it alone the mixed diet capable of sustaining man under the most extraordinary circumstances. It holds the elementary principles which constitute the basis of organic life. In this particular it is more remarkable than any other vegetable production known to man. There is a large number of dishes of which corn meal forms the basis, which are exceedingly palatable. What, for instance, is more delicious than cold corn-pudding cut in slices and fried in sweet butter and lard? Hot corn-cakes, when properly and skillfully made, are almost universally regarded as a luxury, and Boston brown bread is famous everywhere in the country. The reason why corn-meal is not more largely used at the present time is that it is quite difficult to obtain it of dealers or grocers in a perfectly pure and sweet state. Millers grind the corn as it comes from the West, mixed with portions of the cob and saturated with dust and dirt, and this is sold for kitchen as well as for stable use. If good, sweet, corn is properly ground in an old-fashioned stone mill after being winnowed to free it from dust, a meal will result of a rich golden color, and no dish can be prepared from it which will not be palatable and most nutritious. Farmers who go into the market to purchase corn and meal for their animals should understand the great difference in nutritive value between what they can raise and what they purchase.

Insurance Department.

INSURANCE NOTES AND NEWS.

All Reinsurances Declared Illegal.—Between the decisions of the courts on the one hand and the ingenious devices of certain companies on the other, the holders of their policies are promised no end of disquietude and insecurity. From first to last, more than a score of badly managed life insurance companies have abandoned an unprofitable business, most of them making some sort of arrangement to reinsure their risks. This was thought to be a better arrangement than that adopted by the remainder that are being, at great expense and with exasperating slowness, wound up by their receivers. Whatever confidence may have been felt in the various contracts of reinsurance is fearfully shaken by the opinion of Justice Gilbert in the case of the Craftsman and Hope Life Insurance Companies. The opinion of this Court was that the reinsurance of the Craftsman by the Hope, as well as the subsequent reinsurance of the Hope by the New Jersey Mutual Life Insurance Company, was illegal; that all the proceedings taken shall be reversed and the business of all these companies placed just where it was before any steps were taken toward reinsurances.

This decision embodies a principle of very wide application: that a company cannot legally terminate its existence as a corporation; cannot legally put itself into a condition in which it cannot complete its contracts and obligations, and that all action in this direction is unlawful. This rendering applies equally well to every case of wholesale reinsurance, for in every such case the retiring company, by turning over its assets to another company, made the fulfillment by itself of its contracts impossible; and if this decision, which is very sweeping and emphatic, is sustained by the higher courts, to whom appeal will, of course, be taken, it will very seriously affect the *status*, if not the validity, of a quarter of a million of policies, and involve the whole matter in nearly inextricable confusion.

The readers of the Rural will remember that we have always most strenuously opposed the whole scheme of reinsurance, amalgamation and exchange of policies, as being fraught with untold dangers for everybody, and especially for payers of premiums and their families.

Surplus and Premium Rates of Farm Insurance Companies.—The farmers' companies were, as a class, not very fortunate in respect to losses last year. Many of them lost heavily—too heavily, in fact, when the non-hazardous character of their risks is taken into account. The reasons for this are not so obvious as the fact itself, that the proportion of loss to premium of the farm property insurance was nearly double that of all the companies taken together. We note such ratios as 56, 68, 66, 63, 54, 75, 76, 82 and 63. The average of these percentages is not far from 70 per cent., leaving less than 30 per cent. for expenses and nothing whatever for profit, interest and surplus, while the average loss of all the New York companies did not exceed 35 per cent., and that of many of them was only a trifle. There were companies that lost only 07, 08, 10, 07, 05, and one as little as 04½ of the premiums received. The surplus above liabilities follow these figures very closely, some having a very small margin indeed, and only one a percentage of surplus equal to the average of all the companies without distinction. These not very flattering results may be traced to a mistake in the matter of premiums. These have been for many years too low, and unless they are raised to a paying and safe rate, these companies cannot prosper as they deserve. A fair rate is the price of absolute security. A low rate purchases insecurity, uncertainty and perhaps disaster.

Postponed Indefinitely.—The Legislature of this State has again adjourned without, so far as is known, inaugurating any of the measures of reform so confidently promised by the Committee on Insurance. A variety of bills have been presented, but none of them have become laws. There was at one time a strong hope that the companies would be permitted to invest their funds where the highest rates of interest could be realized, instead of being restricted to this city and its immediate vicinity, and that a non-forfeitable law, somewhat similar to that of Massachusetts, would be enacted. But these sanitary measures, together with a number of others only less needful, have failed to become laws.

Domestic Economy.

CURRANT JELLY.

Fill a porcelain preserving kettle with currants well picked over, but not stemmed, set it over the fire until the currants are thoroughly heated, when cool strain through a jelly bag and measure the juice, return to the fire, and boil briskly for twenty minutes, then add one pound of loaf sugar to each pint of juice, stir until thoroughly dissolved, pour into glasses or bowls, and seal when cold. My practice in making jelly, is to use the currants so soon as ripe—not delay one day; if allowed to get fully mature or as commonly termed "dead ripe" there is more difficulty in making good jelly. Mrs. Rustic.

TO BOIL A HAM.

Let it boil slowly for the whole of an afternoon and then let it remain in its liquor over night. Hams thus boiled are far more tender, juicy and sweet than when boiled a shorter time and at once removed from the water.

To Devil Ham.—Cut up fried ham in small bits not larger than peas. Add tomato catsup, a teaspoonful of whisky, one of Worcestershire sauce and a small quantity of flour-water—then heat to boiling. It is just an appetizing delicacy for these warm days. Mackelroy.

HOW TO COOK GREEN PEAS

Wash and put them into enough boiling water to nearly cover them, add one teaspoonful of sugar, a lump of baking soda the size of a large pea, to every quart of peas, when tender, add a good lump of butter, salt to taste. Send to the table with the water in which they are boiled. Omit the sugar when cooking the Champion of England variety. I would suggest to my "city cousins" who are unable to procure peas fresh picked from the vines, to try this recipe and I doubt not they will pronuce it delicious.

Mrs. Rustic.

SELECTED RECIPES.

Beef Cakes.—Chop pieces of roast beef very fine, mix in grated bread crumbs in proportion of one-third crumbs to two-thirds beef; season with pepper, salt, chopped onions and parsley; moisten with a little of the drippings or catsup; a little cold ham or tongue will improve them; make in flat cakes, and spread a coat of mashed potatoes on the top and bottom of each. Lay a piece of butter on every cake and set in a quick oven to brown. Other cold meats may be prepared in the same way.

How to Cook Codfish.—Put the fish to soak in cold water over night. In the morning remove it into fresh warm water, and set by the fire. Half an hour previous to its being dished up, change into fresh water, and simmer over the fire nearly to boiling heat, but no higher. This management does not draw out, but revives and enlivens the nutritious substance in them; and leaves the fish tender and delicious.

Fresh Meat Griddles.—Chop bits of any cold roast meat, season with pepper and salt, make a griddle batter, put a spoonful on a well buttered iron, then a spoonful of the chopped meat and on this another spoonful of the batter. When cooked on one side turn—when done, send to the table hot. They are very nice for breakfast or lunch.

Jumbles.—Take six eggs; a cup and a half of sugar; one of butter; beat to a froth; add flour enough to roll; flavor to taste; cut out with a large tumbler, and cut out the middle with the top of a small canister, to leave a perfect ring. They should be rolled in powdered sugar, and baked in a quick oven.

Cookies.—Two cups of sugar, one half cup of butter, one cup of sweet milk, one teaspoonful of baking powder, flour enough to roll, carraway seeds if liked. Mix the baking powder thoroughly through the flour.

SKILL, OR NATURAL ADVANTAGE?

Is it skill or natural advantages of the locality which insure a man success? We are inclined to think it is more frequently the former than the latter, although there are few persons who can be made to confess this, inasmuch as it would disarm all grumblers and leave them helpless upon an altar built of their own shortcomings and weaknesses. Of course we are not inclined to ignore disasters, which do sometimes befall the most industrious and worthy men and women.

A man may be struck by lightning or have his property swept away by floods or fires; but these are occurrences which would be considered exceptions to the general disadvantages to be met in the ordinary channels of business. But if we leave out of the question what may be termed the accidents likely to befall mankind, it will be found that success in life depends more upon the man or woman, than anything which can be discovered in their surroundings, no matter where, or under what circumstances they may be placed. Men must not all expect to secure the wealth of an ASTOR or STEWART, or count their acres and herds by the ten or hundred thousand, like some of our Western farmers and stock raisers; for these are exceptional cases of vast accumulations so far above the average, that they are scarcely to be taken into account when speaking of what the ordinary farmer or business man is capable of doing, provided he possesses the required skill and industry.

We have only to look about us to see hundreds of worthy examples of what men and women may do in the way of rising in the estimation of their fellow beings, as well as in gaining moderate wealth through their own individual exertions. Poverty and adverse circumstances of various kinds may have stood in the way at the outset of their career, but these have all been pushed aside by an indomitable will and perseverance, with a certain amount of skill which can neither be analyzed nor described.

Some persons call success under adverse circumstances, "luck;" but we might as well call the dollar earned by the day-laborer a "find," for both come through a legitimate channel, equally open and accessible to all who may choose to enter and labor therein. Just as soon as a man or woman commences to earn one cent a day or week more than they spend, that moment do they commence to be successful in life. It frequently requires as much forethought, skill, industry and self-denial to save a penny per diem, as it does a dollar; but the principle is all the same, and if persisted in, a person is sure to win in the end.

Now the man who works for a stated salary can better guage his expenses to correspond with his income, than one following a business liable to fluctuations; therefore the latter should be the more careful of the two, but as a rule he is not, because it is *so pleasant* to predicate final results upon occasional successes in any business.

Well, says the farmer, how about my calling, which is one of the most uncertain of all uncertainties—at least we think so; wheat frequently fluctuates to the extent of a dollar a bushel in a year and the price of other products goes rambling up and down to almost as great extremes. All this is true, and your only safety is to base all estimates for future operations upon the lowest figure; then a rise in price will put you just so much ahead, and right here comes a test of the skill of which we have been speaking.

If you cannot raise a crop of corn, wheat or potatoes for less than it commands in market—no matter what the price may be—then better give up farming at once. Do not say that this or that cannot be done, for by looking about, you can see that it *is* done, and the very men doing it are gaining steadily against, what others might call, an inexorable fate. Perhaps some of our readers residing in Nebraska, Kansas and Minnesota, may ask us how much money there is to be made in raising corn at ten or fifteen cents a bushel? Not much if the corn is sold in bulk as gathered from the field. But why should a man sell corn at such prices when, with a little skill and additional labor he can convert it into butter, cheese, lard, pork, beef, eggs, poultry—all of which are wanted in our Eastern markets if not in the Western. By doing this the excess of freight on a bulky over a cheap article is avoided.

Nebraska butter and cheese will fetch as much per pound in New York, Boston or Philadelphia, as the celebrated Orange County, provided it is just as good. Reputation is worth something in the markets of the world, but not without accompanying merit. If the farmers of the Eastern States can afford to pay sixty cents to one dollar per bushel for corn and a corresponding price for other kinds of food for their stock, the Western man should certainly be able to compete with him while the cost of freight upon condensed articles between the two sections is so low. It seems to us that if there is any advantage in locality, it is in favor of the Western farmer. Still, those residing in the older States complain least of hard times and low prices. Is it skill or natural advantages which causes this difference?

THE FIELD EXHIBITION OF REAPERS.

FROM our Centennial Correspondence we discover that the recent Exhibition of Reapers attracted much attention and developed many good results. Novelties in this class of implements were numerous and interesting and the whole affair was of much more importance to our readers than was generally anticipated. No one can read the report and the articles descriptive of the machinery without appreciating the fact that immense labor and sums of money are annually expended in experiments, many of which are fruitless, while others produce results amply compensating for all failures. The great feature of this year is the automatic Binder, of which there are several now in the field.

We are sorry to see also a further report upon the causes of the evident neglect of the Agricultural interests at the Centennial. If this argument of the light subscription to Centennial stock by the Rural population is the prevailing reason in the Commission, we regret that such a set of men were ever appointed. Perhaps our correspondent has not reached the root of the matter yet; but if he has and this is the actual cause of the general snubbing to which this Department has been obliged to submit, our readers will fully understand with whom they have to deal. The Harvesting Trial was a success so far as it could be made one by the Exhibitors, who did most of the work and bore most of the expenses individually. A new idea seems to have struck the Centennial Managers in relation to the Live Stock Exhibition, for, as will be seen by the regulations printed on another page of this issue, they are extremely liberal and make it an attractive feature of the Exhibition and one very inviting to breeders and exhibitors generally. Perhaps they read the papers occasionally and begin to discover that they have made a mistake in putting in the background the solid producing industries of this country. Live and learn, gentlemen! We are none of us too good or too old to do that.

THE MONTANA MASSACRE.

OUR readers have been made aware through our news columns, of the disastrous defeat of our soldiers by the Indians in Montana and the massacre of General CUSTER and more than three hundred soldiers under his command. The announcement struck the whole community with surprise, horror and indignation. Surprise, that so gallant and heretofore victorious a General should have been deceived to his death; horror at the thought of the outrages and mutilations our brave men received at the hands of these Indian devils; and indignation at the imbecility of a Government that, by inaction and dishonesty, has given a cause for hostilities on the part of the Indians. We do not propose to go into heroics over the noble red man. Mock humanitarians and pseudo philanthropists may have the field to themselves without our interference. Nor are we desirous of combating the generally-received idea that all things are created for some good end. But we admit that our mental vision is not sufficiently acute to see of what good to themselves or to anybody else are the American Indians. They fill a place in the history of the world—but apparently that place is now wanted and they must give way. We are believers in Manifest Destiny to the extent that reconciles us to the idea of their entire and speedy extermination. A race that, in so long a time as it has been known, has made no progress, has not shown one particle of inventive talent and that proves incapable of civilization, is certainly of but little use in this world. It is possible transplanting may be of service to them and that in their happy hunting grounds of an unknown future they may attain mental and spiritual growth. The chance is worth something and the sooner they try it the better it will be for all concerned. The cave dwellers and inhabitants of the Lake regions and all other prehistoric races who have gone before, will doubtless give them welcome and we shall gladly hand them over to such illustrious company.

We are not disposed at this time to glorify the Caucasian so much as to claim that GOD made the world and all that is on it for his especial use and pleasure. We know as little of what is to come after as what has preceded us. The law of the survival of the fittest, which we think is now so well understood and conceded as to require no argument, shows conclusively that the Indian must give way, and his entire extermination is only a matter of time.

But with all this there is something to be said for the Indian of the present time and in the present state of affairs. So far as they have rights, those rights have been disregarded. They have been cheated, abused and deceived, and it is not at all surprising that they take their revenge. Even civilized nations, in the full light of the Gospel and in spite of all the moral and religious teachings of a thousand pulpits, have been known, for less cause than have these Sioux, to make war in which were sacrificed not only three hundred but three hundred thousand lives. Let us give the Indian his due. The vilest worm will turn to sting you if attacked and an Indian if not in the fullness of manhood, is more than a worm.

The end is not yet. There will be more fighting—vindictive, revengeful fighting—in which many more lives will be lost and much money spent which could be put to a better use. But it will not be all in vain if it shall teach us, nationally and individually, this truth—that most of the great troubles in the world have their root in dishonesty—and instill in us a desire to do justly, to love mercy and walk humbly.

RURAL NOTES AND QUERIES.

The Drouth.—While in the Western and some of the more Northern States there has been a superabundance of rain the present season, we are are hereabout (in the vicinity of New York) experiencing the severest drouth known to our oldest inhabitants. Meadows and lawns are burnt to a crisp and shade trees dying by the thousands, all for the want of rain. In a recent visit to Philadelphia we saw hundreds of acres of meadows and pasture lands adjacent to the railroads, all burnt over, having taken fire from sparks blown from locomotives; and in several instances beautiful lawns and shade trees growing thereon had been destroyed by fire from the same source. Along with the scarcity of rain the heat is also oppressive—98 to 104 degs. in the shade is about how the mercury has ranged for the past two weeks.

Honey at the Centennial.—If we are not misinformed, the bee-keepers were quite anxious to have honey recognized by the Centennial Commission as one of the *great* and *sweet* products of the land. Their wishes were gratified so far as regards an opportunity to show what they could do with the "nectarine product;" but the time set for the display has come and gone and not one ounce of honey was exhibited. How is this, Apairians? Will you do any better next fall, at the time set apart for Special Display, from Oct. 25 to Nov. 1? We will wait and see!

The Basket Worm.—A very destructive insect known by several common names, such as Bag or Basket Worm, but scientifically, *Thyridopteryx ephemeræformis*, has appeared in immense numbers in parts of Marshall and Maury Counties, Tenn. The cedar trees in the regions referred to are said to be literally covered with these worms, which soon strip them of every leaf and of course death ensues. These worms often appear in the Eastern States and in gardens as well as forests, generally confining their ravages to the common Arbor-vitæ.

RURAL BREVITIES.

ALL who are interested in the Exhibition of Live Stock at the Centennial, should read carefully the regulations upon another page of this issue.

THE American Association for the Advancement of Science meets at Buffalo, N. Y., next month—the day not yet fixed. Scientists will please take notice and get their "papers" ready and send in the title of the same to F. W. PUTNAM, Salem, Mass.

THE so-called Japan Pea, advertised extensively for field culture at the South, is almost worthless except to plow under green for manure. We say let it alone, unless wanted for the purpose named or for feeding to hogs, and for the latter purpose corn is cheaper and better.

THE Cork Oak appears to succeed as well in California as in its native country. Trees planted in 1861 and since pruned up, are now twenty-five feet to the lower branches. The bark on these trees is from one and a half to two inches thick, and the peeling process may soon commence.

BEACH, SON & Co. send us a flower of *Lilium Auratum Virginalis*. It differs from the type in the possession of brighter and wider golden bands and in having few spots which are of the same color. For those who delight in Lily culture and who aim to possess all which thrive without protection, this is a charming variety.

THE Executive Committee of the Michigan State Agricultural Society are reported to have declared that the trials of speed at their annual fairs could not be attempted without bringing in all the objectionable features of gambling incident to regular horse trots, and have decided to abolish it accordingly. Illinois has followed suit.

BUSINESS NOTICES.

THE best house painters prefer Eckstein, Hills & Co.'s **"Phœnix" brand Pure White Lead** to any other in the market, because it is whiter, finer, and will cover more surface.

THAT CALF.

An old farmer, one morn, hurried out to his barn,
Where the cattle were standing, and said,
While they trembled with fright—"Now which of you, last night,
Shut the barn-door, while I was in bed?"
Each one of them all shook his head.

Now the little Spot, she was down in the lot,
And the way the rest did was a shame;
For not one, night before, saw her close up the door,
But they said that she did all the same;
For they always made her bear the blame.

Said the horse, Dapple gray, "I was not up this way
Last night, as I now recollect;"
And the bull, passing by, tossed his horns very high,
And said, "Where's the one to object,
If I say, 'tis *that calf*, I suspect?"

"It is too wicked now," said the old brindle cow.
"To accuse honest folks of such tricks;"
Said the cock in the tree, "I am sure 't wasn't me;"
All the sheep just said "bah!"—there were six—
And they thought now *that calf's* in a fix!

"Of course we all know 't was the wrong thing to do,"
Cried the chickens; "Of course," mewed the cat;
"I suppose," said the mule, "some folks think me a fool,
But I'm not quite so simple as that;—
Well, *that calf* never knows what she's at!"

Just then the poor calf, who was always the laugh
And the jest of the yard, came in sight;—
"Did you shut my barn-door?" said the farmer once more:
And she answered, "I did sir, last night,
For I thought that to close it was right."

Now each beast shook his head; "She'll catch it," they said,
"Serve her right, for her meddlesome way."
Cried the farmer, "Come here, little bossy, my dear,
You have done what I cannot repay,
And your fortune is made from to-day.

"Very strangely, last night, I forgot the door quite,
And if you had not closed it so neat,
All the colts had slipped in, and gone straight to the bin,
And got what they ought not to eat;—
They'd have foundered themselves upon wheat."

Then each beast of them all, began loudly to bawl,
The mule tried to smile, the cock crew,
"Little Spotty, my dear, you're the favorite here."
They all cried, "We're so glad it was you!"
But *that calf* only answered them, "boo!"

[*Phœbe Cary.*

The Story-Teller.

MRS. VANDERDUYNCK.

LETTERS FROM ROGER FLOYD TO HOPE STANHOPE.

BY MISS E. W. OLNEY.

[Concluded from page 29, last number.]

VI.

RIVERBEND, August 30.

Your letter, in answer to my confession of accursed folly, was a sensible one, Holt, and a logical one, too. But talk to me no more of a wife—of a fireside—of sweet home joys. Speak rather of effort and the results of effort. Undoubtedly it is pleasant to be free to introduce romance into one's life; but I am not one of those men born to tread on roses.

But I will confess this much, Holt:—Were Evelyn poor and obscure, she should have been taken to my heart forever that night of the ball. I do not suppose that mine is a character formed to make many women happy, yet I could make her happy. I am not a visionary fool, yet I know I could make her happy. But she has eighty thousand a year, Holt, and I—I at my best can make about three thousand. A gulf divides us. It is now improbable that I shall ever see her again. She has gone to Newport and the boys tell me she sails for Europe in October. Be it so.

You wished me to tell you the sequel to the night of the ball. Did you not then understand that that was the final close—that further evolvements were rendered impossible by the fact that when I went to bed that night I had turned my back upon the allurement that was emasculating me? I rose betimes next day. I knew the boys would be peevish and fretful after their late hours and their unaccustomed indulgence at supper. Accordingly, to turn their thoughts, I proposed an excursion to the quarry and took them five miles to see the curious geological formations lately exposed there, of which I have already sent you an account. I found an invitation from Mrs. Hunt to take tea with herself and Mrs. Vanderduynck on my return, but I sent a courteous refusal. Next morning the boys and I grappled with study in good earnest and for the next five days I scarcely left the schoolroom until dusk. One afternoon, as I was setting copies for Albert, I discovered that one of my sleeve buttons had vanished and remembered at once that I had heard something fall as I crossed the terrace after going to the garden to pick fruit at luncheon; so accordingly I dispatched John to search for it. As he went out he opened the door upon Mrs. Vanderduynck, who had, I fancy, been standing outside waiting for courage to knock. She now entered timidly and addressed me without raising her eyes to my face, asking if the boys could drive with her to O——.

"I have no objection," I returned, going on with my writing. "When do you wish to set out?"

"I ordered the ponies at three o'clock," said she.

"Go then, Albert," I remarked, "and tell John that I will find my stud myself and then both of you get into your best clothes as speedily as possible."

Albert leaped out of the room, rejoiced to get rid of his writing lesson. I was *vis-a-vis* with Mrs. Vanderduynck.

"Have you lost your sleeve button?" she asked, breaking a stiff silence.

"Yes," said I; "my cuffs are rather worn by washing and the button-holes are too large;" and I matter-of-factly held them up for her inspection.

"Let me mend them for you," she exclaimed, laughing. "I will run and get my work-basket." And she left the room without giving me an opportunity to speak, returning in about three minutes and at once came up to me with her thimble on her finger and a threaded needle in her hands. I, not to be outdone in artlessness, held out my wrist to her. She mended the place skillfully. I was restless under her presence, yet betrayed nothing. We were quite silent. I looked out of the window, having glanced but once at the little fingers so near mine and tried not to shiver when now and then they touched each other.

"There," she cried finally, "that is better."

"Yes," said I; "that is much better and besides that, it was very good of you to take so much trouble."

"I like trouble for my friends," she murmured, coyly.

"And we are friends?"

"I had hoped so, Mr. Floyd," she answered very softly, looking up with wistful eyes, "but you take small account of my friendship. It is I who am not your equal. It is a condescension for you to be my friend."

"Do not exaggerate," I said exactly as I speak to the boys when they are too highflown. "I dare say that in the kingdom of heaven we may be equals, but certainly nothing can be more different than our spheres on earth."

"The horses are at the door," she said, with assumed calmness, "and I hear the boys coming down stairs. I wish you a very good afternoon, Mr. Floyd."

She left me. When the blood she had sent surging to my heart stopped boating so violently, I went out and found my sleeve-link.

The boys came back each with a pale face and a headache and finally confessed that they had gorged unchecked at a confectioner's where their "grandmamma" had given them permission to eat whatever they fancied while she drove about all alone, for she had been very silent and sad for all the way—"Not jolly like grandmamma at all, you know," Albert added, indignantly. Mrs. Hunt came into the school-room herself next morning to ask me to dine with her at five o'clock and when I refused she asked if I had reason to be offended either with herself or Mrs. Vanderduynck. "Certainly not," I returned.

"Why, then, do you refuse all invitations to meet either of us?" she pursued, with a keen glance. I returned her look with a half smile and was silent. She came up to my desk and put her hand on my arm. "Mr. Floyd," said she softly, "I once told you that my stepmother was a coquette. I wronged her in saying so. I think now that she is not only no coquette, but that she is one of the most frank and warm-hearted of women."

"I quite agree with you," I returned coolly. "I never considered Mrs. Vanderduynck the least of a coquette." Mrs. Hunt laughed.

"Come and take tea with us to-night at eight o'clock," said she, good-naturedly. "I shall accept no refusal. I insist upon your joining us in the boudoir after you are through with the boys." I assented of course and in the evening met the ladies in the little room off the library. Little Cora sat beside me while I drank my tea and finally dropped off to sleep, her head against my knees, her arms clasping my legs. The conversation, although conventional, was sufficiently interesting, as we were discussing some new books. Mrs. Vanderduynck said little, but looked more lovely than ever. She was in black, with some shining gauzy white overdress and her golden hair was bound in a Grecian knot. She wore not a single ribbon or jewel—in her hand she held a rose which she played with incessantly and with her fitful color and her drooping eyes and modest manner, she looked barely sixteen. After a time she went into the next room and sitting down at the piano she sang in a soft low voice. I think all the airs she chose were adieux. Little Cora slept on. I felt dreary, Holt, dreary. Mrs. Hunt was tranquil and gracious and took up some work when the tea things were removed.

"Don't trouble yourself with the child," said she. "Go in and hear Mrs. Vanderduynck sing."

"Thanks," I returned. "I can hear her with perfect distinctness here." Mrs. Hunt began talking about the young people who had been staying with her—told about the flirtations which had culminated in engagements beneath her roof.

"Apropos," said she, "I have a suspicion that you are engaged to be married, Mr. Floyd."

"Not at all," I replied, meeting her keen glance calmly. "On the contrary, I have never yet asked a woman to marry me."

"But you wish to marry ultimately," she suggested. The music ceased. I could see the slender yet voluptuous outline of the white-draped figure posed in a listening attitude.

"I may many years hence," I returned, phlegmatically, "provided I find the wife I need."

"What would she be? Some miracle of beauty doubtless."

"Quite the reverse. I fancy she would be plain. I should choose a woman who would be my companion in a laborious life; who could, if need be, follow me into the wilderness, cook my food, endure fatigue, think little of herself but much of me; be cheerful under hardships and able to inspire my depressed soul with courage and serenity."

"You are right," interposed Mrs. Hunt, laughing. "The wife you describe must needs be plain; she——"

"But it is too much to ask of any woman," said I, with a half laugh; "hence, I expect to go through life alone. I doubt my capacity for loving a plain woman. As for a beautiful one whom I did love, I should prefer that she should be more fittingly enshrined than in the life of a man like me, who is not only poor but will always be poor—whose profession denies him emolument."

"A clever man like yourself, Mr. Floyd," said Mrs. Hunt in the pleasant tone of a woman who wishes to stroke you the right way, "a man like yourself, of good family, of personal accomplishments, high culture and in your way rare ability, ought not always to be poor. You should marry a rich woman whose money would enable you to devote your life to scientific research and pursuits which help on the cause of humanity."

I looked up and saw Mrs. Vanderduynck's pale face and gleaming eyes. Little Cora had awakened. I took her in my arms and pressed my lips to hers. I did not ask myself whence came the passion which fevered the caress. All this before I answered.

"Mrs. Hunt, my wife must take everything from me. I could accept nothing but herself from a woman."

"Yet if you loved a rich woman—what then?"

"My passions wait upon my will," said I, rising. "Marry a rich woman I could not and would not." I carried Cora to her mother's side. "I understand you leave for Newyort to-morrow, Mrs. Vanderduynck," I went on, looking anywhere except into her face, "and I will bid you good-by, with the hope that you may enjoy your visit."

She said nothing; did not even lift her hand toward me from her lap, where it lay clasping the other. I took it gently in my own. It was tremulous and cold. I did not press it, merely touched it; then I clasped Cora in my arms again and strained her to my breast.

That was the end, Holt. I did not look up next morning when the carriage rolled past the schoolroom window where I was sitting.

VII.

RIVERBEND, October 27.

I was in New York four days last week, dear Holt, and was sorry to learn that you were in Washington. Had you been in town I should have presented you to the woman I am to marry some three months from now. She is anxious to meet you and will herself ask you for all the letters I have written you concerning her; so, my boy, if you think my wife will quarrel with me for them, I advise you to read them well before that time comes. I confess that I feel a trifle shy about telling even you of the change in my life. For a change it is, radical and entire, and I had, moreover, committed myself to a contrary course.

After Mrs. Vanderduynck went to Newport I gave myself up to study. I was sick of theorizing—I needed facts. I took up the Russian language and refreshed myself by reviewing my mathematics. The house was dull. Mrs. Hunt went to the White Sulphur Springs and the boys and I had the place to ourselves except for a week, when Mr. Hunt brought a set of choice *convives* to rouse the echoes night after night and lame the horses by day. When we were again alone I used to wander aimlessly about the deserted rooms. It was a foolish practice, for it made my stifled passion almost burst its prison in its frenzied efforts for liberty, when I went into the little parlor where I had last seen Evelyn.

Late in September Mrs. Hunt returned. She looked at me curiously. I had changed, she remarked. "How so?" I demanded. She could not tell. She had been in Newport for a week, she went on to say, visiting Mrs. Vanderduynck in her pretty seaside cottage. Poor thing, she was so ill!"

"Ill?" I ejaculated.

"Yes," said Mrs. Hunt, meeting my startled glance coldly. "I think she is just in that state of health when it is quite easy for a young woman to die of some disease for which hereditary traits have predisposed her."

"What has put her in that state of health?" I inquired gravely. "She seemed thoroughly well when she was here."

Mrs. Hunt played with her bracelets but said nothing.

"She sails for Europe on the 20th," she resumed, after a pause, "and will spend the winter at Nice with my sister."

I asked no more. Mrs. Hunt's words and manner haunted me. I wished that she had been more explicit, for absolutely the impression she had left upon my mind was that my darling was suffering on my account. What a bond slave a man is, Holt, so soon as he leaves the domain of incontestable facts and goes to wondering, hoping, fearing! I could not sleep nowadays unless I tired myself out by violent exercise. If I took my pen to write, no train of thought could hold me from drifting into revery. Evelyn pursued me in fancy. I had a vague, diffused, melancholy feeling about my heart constantly—in fact, I was a confounded spooney. I did not dream of seeing her again, for the boys had showed me the handsome presents she had sent with a farewell letter.

Time passes, even for infatuated idiots, and presently it was the 16th of October and Evelyn was to sail on Saturday. Mrs. Hunt came into the school-room one afternoon with a telegram in her hand. "Mr. Floyd," said she, "would you mind driving over to the station to meet Mrs. Vanderduynck? I have a dispatch saying that she will be here at 3.25. The men are all busy and I scarcely dare to trust the boys."

"I thought Mrs. Vanderduynck was on the point of sailing for Europe," I gasped.

"So she is," returned Mrs. Hunt, "but she comes up for a night to bid me good-by. Will you go?"

"Certainly," I assured her, "and I will take the boys in the brett. They are good boys to-day and deserve a treat."

"Wouldn't it be better to go alone in the phæton?" suggested Mrs. Hunt, softly.

I dissented drily and presently was driving to the station with the boys crowded on the front seat with me. We met Mrs. Vanderduynck. I was more than composed; I was apparently ossified. I took her bags, offered my arm to her, put her in the carriage with Albert next to her and then John and I mounted in front and we set off home. I was driven by demons that night. No sooner had we reached the house than, after handing her from the brett, I gave the reins to the groom and set off on a long walk over to see Prof. Walker and his new fossils just brought from the West and did not return until eleven. I entered quietly, intending to go up stairs at once, but Mrs. Hunt came out of the drawing-room and called me in. Mrs. Vanderduynck was sitting by the table and the lamp screen completely shaded her face; but as the light fell on her hands crossed in her lap, I saw that they were thin and that the poor little wrists seemed a third smaller than they had been in the summer. I sat down at once and began to talk about Walker's fossils. I was master of the occasion. Neither woman dared oppose me. I congratulated Mrs. Vanderduynck upon her plans for a gay European winter. I told Mrs. Hunt I had seized that opportunity for my twelve-mile walk to the Professor's, because I knew that the two ladies would have a thousand things to say to each other and that I should be in the way; then, rising, I declared myself tired and hungry and added that I was going to ask Thomas for a biscuit and a glass of wine; and I left the room, going up stairs presently, humming a tune as I followed the butler as he carried a tray of refreshments. I never thought of touching to the schoolroom. Albert and John did not want to have lessons next morning because grandmamma was going away at twelve o'clock; but I told them that if their mamma or grandmamma had wished it, they would have asked a holiday for them. So the lads docilely went to work and the morning progressed as usual.

At half-past ten a knock came at the school-room door and the servant said that Mrs. Vanderduynck asked if the boys might come to her room for half an hour. "My respects to Mrs. Vanderduynck," I returned, "and will she not come to the school-room to see the boys? They want to show her their new desks." I wanted to see her, Holt, but I wished to see her protected by my pupils, who would rob the situation of embarrassment for me at least. She entered timidly. She was dressed in a dark-blue traveling dress and its simple cut made her figure look very slight, while her face seemed thinner and paler than of old. She spoke to me respectfully but did not look at me. Her whole manner was very gentle but very dignified. She went up to the boys' desks and sitting down, held each by the hand while she talked to them. This was the last then, I thought within myself drearily. In an hour she would be gone and I should never see her again. I opened my books and turned the leaves while the group across the room prattled on. She was telling about Cora, whom she had left behind her in New York. "I am sorry you did not bring my little friend," said I, interrupting presently. She turned and looked at me and our eyes met. She tried to speak but could say nothing and blushed painfully. My heart beat so fast it almost stifled me; but I crossed the room. "Boys," said I, authoritatively, "I wish to speak to Mrs. Vanderduynck a moment. Go out on the lawn and stay until I call you in."

They obeyed, open-eyed—Albert with his tongue thrust in his cheek, each scenting the meaning of the situation. Mrs. Vanderduynck was very white and trembling as I went to her and took her hand.

"I have something to say to you," said I, fixing my eyes on her face and compelling her to meet my glance. "Perhaps it would be better for me to continue silent; but I am only a man, Evelyn, and I cannot meet such a look as you gave me then and not speak. I love you. I love you better, far better than anything else in the world. I never loved a woman before and I never can again. Were you poor and obscure like me, it would be the happiness of my life to offer you my service—to win you for my wife if I could; to work for you and to carry you through the world without your feeling a care or pain. But now——" I paused. Warm delicious color had vivified her face and in her eyes shone pure content.

"But now?" she whispered softly, putting both her hands in mine. I flung them from me, for in their touch lurked all the magnetism which can rob a man of self-control. I felt weak—weak as water. I went over to my desk, sat down and leaned my head upon my hands.

"But now?" she said again.

"But now," I resumed in a stifled voice, "how can I ask you to marry me? It seems a baseness for me to try to win you when I have so little to give you."

She was close beside me now. "Forget my wealth," she said simply; "forget your pride. Look up a moment." I looked up. She put her arms about my neck, her cheek to mine, her lips were at my ear. "I love you," she whispered. "I love you so dearly, Mr. Floyd."

Heaven had come down to me, Holt, and I accepted heaven.

Half an hour afterward we were still at my desk. I was in my chair; but she was on my knees, the sweetest, frankest, loveliest child in existence. "Suppose I had not come yesterday," she was saying.

"Suppose nothing," I returned, "which can make me out the wretchedest man in existence. I believe in fate."

And so do I. I believe just now that the world was made just for Evelyn and for me to live in; that the flowers bloom for our sakes; that the moon shines for us; that the stars move in their courses to guide my darling across the deep seas.

She told me all about herself; how, when she was seventeen, her father had wished her to marry Mr. Vanderduynck, who had offered himself to her; how she had refused, until a month later her father lay dying, a broken-hearted bankrupt, and had told her he should not rest in his grave unless he left her with a protector. She spoke of her brief married life; of her dejection and apathy in being bound to a man who loved her madly, but who failed to inspire anything but a gentle commisseration in her heart and a self-horror that she could not respond to his devotion with anything more than childlike docility; of her child's birth when she was not yet eighteen; of her husband's death shortly after; then her three awful years of seclusion, when she was haunted in her loneliness by the thought that she had failed in a wife's duty by not loving her husband. At last she told of her going back into the world again, where she was besieged by every form of flattery and homage; how she easily read the meaning of the men who wanted her money; of how lonely she felt still; of how little she cared for all the gifts fortune had so lavishly bestowed on her; and then she whispered of her meeting me! However undeserving you may be, Holt, I hope you will some time know the exquisite flattery of hearing from the lips of the woman you love that you seemed to her from the first sight all that she most longed for in the world. But I shall never tell the rest of what my dear child told me during our three hours' talk. Her train had been gone an hour before either of us thought about it. Then, as we looked at our watches, she laughed and blushed. "I will go to town with you myself by the early train to-morrow," said I then. "But tell me, Evelyn, about your health. You have grown pale and thin, rosy though you may be now." She clung to me shyly.

"I was so unhappy," she whispered; "nothing seemed to me worth living for when you told me you would not marry a rich woman. I wanted to fling my wealth away as I once flung those cameo studs. Do you remember, Roger? I could not sleep, I could not eat. I hoped I should die, I was so tired of everything!"

[You won't know what my answer to that was, Holt.]

"I shall be well now," she observed, presently.

Mrs. Hunt came in just as we were blushing at the thought of going down stairs together.

"I came to inquire," said she, smiling, "if I might have the boys to go over to—— with me. Since you ordered them to the lawn they sit there on the bench like two Casablancas, and tell me they cannot stir till you give them leave."

"Give all the world a holiday! dear Mrs. Hunt," cried I. "Guess what has happened?"

"I know," said she, kindly, "and it is the most sensible thing for yourselves, as it is the pleasantest thing for me." She kissed Evelyn warmly, then gave me her hand, which I carried to my lips. "Suppose you come to luncheon now," she continued with her perfect tact, "and then, Mr. Floyd, don't you want the phaeton for a drive? By the time you come home you will be ready to talk our plans over with me in my dressing-room."

We lunched. Then I drove Evelyn to the lake and we strolled around until it was within an hour of dinner-time. The servants stared and grinned when we came back and the boys exploded with laughter in the alcove as I went up stairs. Truly, Holt, a man needs to be pretty well in love to endure the tame-bear feeling he has when first engaged. But although I caught myself smiling idiotically at times, I rather enjoyed it—particularly Evelyn's singing in the evening and the little talk we had together on the sofa before she went to her pillow. I brought her to town next day. She stopped at the Brevoort and I at the Everett, that our secret might not be known to the world.

Saturday she and Cora sailed. She did not want to go, nor did I wish her to cross the ocean without me; but it was decided to be better on all accounts that she should join Mrs. Winslow in Nice, where I shall go in January, at which time we shall be married, then to settle down quietly at once in Paris. Cora likes me extremely for a papa, she affirms—almost better than mamma; for mamma is a woman, and she prefers men.

[*From the Galaxy.*] ROGER FLOYD.

A SURPRISE PARTY (!)

THE night chosen for the undertaking proved to be a lovely moonlight one. The troops assembled near Kearny's headquarters about nine o'clock in the evening, and leaving all impediments in the way of blankets, overcoats and unnecessary accouterments behind, we soon began our silent march to the front. It was known that the Confederate pickets were posted four or five miles in advance; but before marching half that distance a halt was ordered and additional precautions adopted to preserve secrecy in our movements. From that point we pursued our way as quietly as possible, no one being allowed to speak above a whisper. Sometimes, instead of following the road, we made our way through paths in the forest, feeling our way as cautiously as if masked batteries—then the *bete noir* of the average volunteer—were bristling from behind every bush. The cracking of a twig in the distance or the stumbling of one of the leading files over a concealed log, was sufficient to cause the entire column to halt and with bated breath peer into the darkness of the forest in vain endeavor to discover a foe whose presence at that particular time was not desirable.

In this manner we continued our course, at each step the tension on our nerves (to describe it by no other name) becoming greater and greater until we resembled in enlarged form some ludicrous stage picture in which the alarmed family, aroused from their beds by noise of imaginary burglars, come stealthily, timidly into the room, staring in all directions to discover the disturber of the household and ready to drop all weapons of defence and seek safety in flight at the first real cause of alarm. So it was with us. Inexperienced, magnifying the strength and terrible character of our unseen foes, dreading surprise, we had worked ourselves up to so excitable a condition that all that was necessary to terminate our anxiety as well as the expedition, was to confront us with an undoubted enemy. We were not to undergo much longer delay. The house about which the picket was posted and which was to be the object of our attack—a surprise, if possible—was located at one end of a long lane, at the foot of which we now found ourselves. A brief halt was made, final instructions from our leaders were whispered from ear to ear, and again we moved forward. Owing to clouds we could only receive partial benefit from the moon; sufficient, however, to discern in the distance at the head of the lane a clump of trees, within which the house was said to be located.

As we silently made our way up the lane, moving in column of fours, with not a skirmisher or advanced guard thrown to the front, every isolated tree or even the farmers' herd grazing in the fields near by were sufficient to make us halt and determine whether or not we were being "flanked." Frequent discoveries of our errors in this respect might have inspired us with some little confidence, but at that moment we surely heard human voices up the lane in the vicinity of the house. Of course we halted. It did not impress me that we were engaged in a military undertaking; on the contrary, it struck me as resembling upon a large scale some boyhood scheme involving a movement upon a neighboring orchard or a melon patch, and the time had arrived, just before crossing the fence, when the impression prevails that the owner of the orchard and his dog are on the lookout. Halting to listen and distinguish the voices again, a silence ensued, during which the clouds cleared away, permitting the moon to shine forth and light up the whole scene, and enabling the enemy's pickets to take in at a glance who and what we were.

"Who comes there?" rang out on the still night air; and without waiting for an answer bang! bang! bang! went three muskets. It was a sorrowful waste of ammunition to fire three muskets when one would have answered as well. I am sure that while we may have all been facing toward the house when the first shot was fired, we was not only facing but moving in the opposite direction before the sound of the last one reached our ears. I presume, too, that the fellows who fired the shots ran, in the opposite direction, faster than we did—that is, if they were disposed to be active. But all chance to effect a surprise having been lost, our party did not propose to expend either time or ammunition in furtherance of the object of the expedition. We beat a hasty if not precipitate retreat and returned to our camp in less than half the time it had required to march from there. The same officers and men who participated in this little affair, if charged with the same duty one year later, at a time when they had become more familiar with the operations of war, would have in all probability succeeded in capturing and bringing away as prisoners the entire picket guard and its immediate reserve.—*Gen. Custer in June Galaxy.*

DISCOURAGING.

A DETROIT youth of thirteen sold fifty pounds of old iron and a piece of lead pipe a few days ago and received enough money to carry out his long-cherished idea of establishing a weekly newspaper which should represent the interests of every section of Michigan. He was willing to commence low down and work up, and he established an office in the cellar of his father's house, purchased two quarts of "pi," hired his sister as an apprentice, and work was begun on his first number. The boy had an idea that an independent journal would pay best, and his first edition, which consisted of seven copies of a sheet about as large as an envelope, was devoted to items of a personal nature. It was rather a family sheet, also, seven of the eight items in it being hits at his father and mother, and the lone one was a bit of advice to his school teacher. While he was out hunting up advertising and soliciting subscribers his father laid the type away to shoot cats with, his mother kindled the fire with the wooden press, and when the editor and proprietor returned he was given a woodshed interview and then wedded to the handle of a lawn mower. He was yesterday "hollering" over the alley fence to one of his friends that he couldn't be crushed out nor frightened off the track by no bloodthirsty mob, but the prospect for a new paper is dubious.—*Free Press.*

BISMARCK'S PRIVATE CORRESPONDENCE.

FROM an interesting letter from Count Bismarck to his wife, July 9, 1866, published with his sanction, we extract the following:

"The Austrians stand in Moravia, and we already have the audacity to mark our headquarters for to-morrow at the position they occupy to-day. If they bring up their Southern Army we shall yet, with God's help, beat them. General confidence prevails. Our men deserve embracing (*sind zum Kussen*), every one of them; brave to death, so quiet, obedient, polite, with an empty stomach, wet clothes, little sleep, loose boot soles, kind to all, no plundering or burning, paying for all they can, and living on moldy bread. There must be a deep foundation of God's fear in our men, else they could not be all that. The King exposed himself very much on the 3d, and it was as well I was with him, for the warnings from all others were of no avail and none would have dared speak as I did at last, when I was successful, whilst a knot of ten cuirassiers and fifteen horses of the Sixth Regiment were weltering in their blood close to us and the grenades were whizzing most alarmingly about the master. The most dangerous of them did not burst, fortunately. Still, I like this better than if he were too cautious. He was enthusiastic about his troops and justly so, and thus he did not seem to notice the whistling and cracking near him, seated as quiet and comfortable as on the Kreuzberg, and always finding fresh battalions whom he could thank and wish good evening to. But now he has been lectured so much about it that in future he will take better care of himself."

ANCESTRY OF THE PEN.

THE earliest mode of writing was on bricks, tiles, oyster-shells, stones, ivory, bark and leaves of trees; and from the latter the term "leaves of a book" is probably derived. Copper and brass plates were very early in use; and a bill of foefiment on copper was some years since discovered in India, bearing date one hundred years B. C.

Leather was also used, as well as wooden tablets. Then the papyrus came into vogue, and about the eighth century the papyrus was superseded by parchment. Paper, however, is of great antiquity, especially among the Chinese; but the first paper mill in England was built in 1586 by a German, at Dartford, in Kent. Nevertheless, it was nearly a century and a half—namely, in 1713—before Thomas Watkins, a stationer, brought paper making to anything like perfection.

The first approach to a pen was the stylus, a kind of iron bodkin; but the Romans forbade its use on account of its frequent and even fatal use in quarrels, and then it was made of bone. Subsequently, reeds, pointed and split, like pens of the present day, were used.

HOW OPINIONS ARE FORMED.

THERE is probably nothing that so obstinately stands in the way of all sorts of progress as pride of opinion, while there is nothing so foolish and so baseless as that same pride. If men will look up the history of their opinions, learn where they came from, why they were adopted, and why they are maintained and defended, they will find, nine times in ten, that their opinions are not theirs at all—that they have no property in them, save as gifts of parents, education and circumstances. In short, they will learn that they did not form their own opinions—that they were formed for them, and in them, by a series of influences, unmodified by their own reason and knowledge. A young man grows up to adult age in a Republican or Democratic family, and he becomes Republican or Democrat in accordance with the ruling influences of the household. Ninety-nine times in a hundred the rule holds.—*Dr. J. G. Holland.*

AN ACT OF HEROISM.

WE have much pleasure, says the Builder, in recording an act of courageous self-control and presence of mind. Two workmen were engaged fixing a lightning conductor on the summit of the steeple at Ville-sur-Ourthe, in Belgium. To accomplish this it was necessary that one of the workmen should stand on the shoulders of his companion. While in this position, a violent gust of wind made him spill some molten lead, which fell on the hand and forearm of his friend. Notwithstanding the sudden intensity of the pain thus inflicted, the victim of the accident had the courage to remain motionless while the lead burned its way into his flesh. He knew that the slightest movement might suffice to precipitate his companion from a hight of 70 feet into the street below, and he bravely endured the pain rather than imperil the life of his fellow-worker. M. A. Karls, slater, at Anthisne, is the hero of this brave deed, and his name is worthy of public record.

SHAM MEERSCHAUMS.

MEERSCHAUM shavings and dust are used when compressed for making inferior or imitation pipes; 41,100 weight of this waste are annually consumed in Vienna in the production of pipes, cigar-holders, &c., and the imitation has been carried to such perfection that connoisseurs sometimes find it difficult to distinguish these articles from similar ones of the genuine substance. Of the meerschaum itself, 12,000 cases (each weighing fifty or sixty pounds and worth $175 a case) are used up in Vienna alone. In working up the shavings and dust into materials, about sixty women are employed in Vienna in sorting, sifting, washing and cleansing the refuse and rubbing it through silken sieves.

MY TREASURES.

BY RAY HULBURT.

I AM standing to-day on the evergreen bank
O'erhanging the River of Time;
In the distance behind me are memories rank—
Before me the future sublime.

About me are twining the affections of old,
Like tendrils of new-grown moss;
While pictures of silver and threads of gold
Are gleaming amid flakes of floss.

As I stand on the banks of this beautiful shore,
Now washed by the Waters of Life,
I find fresh among the bright treasures of yore,
The pearls of the present are rife.

And my heart wells upward, toward the Great White Throne,
As I glean of these rubies so bright,
And I offer to Him who sitteth enthroned,
My treasures for His World of Light.

ONE ALONE.

BY MRS. HATTIE F. BELL.

I HAVE been thinking to-day of a sweet little girl of five summers, who once visited at our house. She was a dear little prattler, and her cheerful voice made music for us all those long summer days, when her light feet danced through the rooms of that old house at home. I have not seen her for many a year, and if she is still on earth she has outgrown those happy days of childish bliss, and stands to-day crowned with all the blushing honors of sweet sixteen, to help her on through young-ladyhood. I presume she has forgotten all about me, but there has ever been a sweet, fresh memory of her in my heart, imprinted there by the circumstance which now leads me to write this sketch, thinking perhaps the thought may cheer some one, as it has me many a day.

I remember so well just how she looked that morning, as she sat on the floor by the little, low chamber window, in her long, white night-dress, and looked out into the tall, old locust trees, that every year had kept creeping nearer and a little nearer, until now they fairly looked straight into my room, and nodded an airy greeting to me every morning, with a sort of musical accompaniment, tapped out in broken time with their long, trembling fingers upon the window pane. I never in my life saw an angel, but I think she must have looked like one, if ever mortal did, that morning, with her fair hair floating away over her shoulders, and her large, brown eyes, so thoughtful and so beautiful, withal.

"Cousin HATTIE,"—I turned as the sweet voice echoed my name,—"Cousin HATTIE, if everybody in the world should die—all the men and women, and all the little boys and the little girls—everybody but just one man, what do you suppose would become of him?"

It was a strange question, and something I had never thought of,—this idea which she, in her child-wisdom had advanced. I paused to think of some wise and fitting reply, as became my maturer years; but the little questioner was again all too quick for my slow thoughts, and with a satisfied smile said, "Oh! I guess JESUS would take care of him. Wouldn't He?"

Dear little MAY! Of course I assured her He would. And I could not resist the impulse of rushing up to her and half smothering her with kisses, while my eyes grew so moist and dim I could scarcely see the old locusts that still kept nodding and bowing to us through the open window. They looked as if they had all suddenly dipped their heads under water.

This beautiful lesson, that that baby-teacher unconsciously taught me that bright June morning, I have never forgotten, and it comes to me often afresh, in all its sweet simplicity. How true it is that JESUS cares for each one of us *alone*, and that *for one* He would have died as soon as for the multitude. Oh! if we can only have the sweet trust and unquestioning faith of innocent childhood. Even when left alone by earthly friends, and all we've cherished and loved, yet our dear, Heavenly Father, we know, will ever, in His goodness, be sure to "take care of us."

THOUGHTS FOR THINKERS.

THERE is no outward sign of courtesy that does not rest on deep moral foundation.

HEAVEN is a state of entire acquiescence in the will of God, and full sympathy with his purposes.

HE who thinks he has enough of the Holy Spirit will quickly find himself vanquished by the evil spirit.

A WELL grounded assurance is always attended with three fair handmaids—love, humility and holy joy.

THE generality of men expend the early part of their lives in contributions to render the latter part miserable.

THERE is not a sin a saint commits but Satan would trumpet it out to the world if God would give him leave.

PRAYER is nothing but the breathing that out before the Lord that was first breathed into us by the spirit of the Lord.

HE who will not improve two talents shall never be trusted with five, but he who improves a little shall be trusted with much.

THERE is a difference between consecration and sanctification. The former belongs to us, the latter to our faithful God. We cannot have the latter without the former.

Ladies' Portfolio.

HIE AWAY.

Hie away, hie away!
Over bank and over brae,
Where the copsewood is the greenest,
Where the fountains glisten sheenest,
Where the lady-fern grows strongest,
Where the morning dew lies longest,
Where the blackcock sweetest sips it,
Where the fairy latest trips it:
Hie to haunts right seldom seen,
Lovely, lonesome, cool and green,
Over bank and over brae,
Hie away, hie away!

[*Sir Walter Scott.*

MR. RUSKIN ON FEMALE ATTIRE.

In a late number of *Fors Clavigera*, Mr. Ruskin advises his girl readers as follows.—"Dress as plainly as your parents will allow you, but in bright colors (if they become you) and in the best materials—that is to say, in those which wear longest. When you are really in want of a new dress, buy it (or make it) in the fashion; but never quit an old one merely because it has become unfashionable. And if the fashion be costly, you must not follow it. You may wear broad stripes or narrow, bright colors or dark, short petticoats or long (in moderation), as the public wish you; but you must not buy yards of useless stuff to make a knot or a flounce of, nor drag them behind you over the ground. And your walking dress must never touch the ground at all. I have lost much of the faith I once had in the common sense and even in the personal delicacy of the present race of average English women, by seeing how they will allow their dresses to sweep the streets, as it is the fashion to be scavengers. If you can afford it, get your dresses made by a good dressmaker, with the most attainable precision and perfection; but let this good dress-maker be a poor person living in the country, not a rich person living in a large house in London. Learn dress-making yourself, with pains and time, and use a part of every day in needle-work, making as pretty dresses as you can for poor people who have not time nor taste to make them nicely for themselves. You are to show them in your own wearing what is most right and graceful, and to help them to choose what will be prettiest and most becoming in their own station. If they see you never try to dress above yours, they will not try to dress above theirs."

WHAT A WEAK WOMAN CAN DO.

She can sit at the open window of a railway carriage with a stiff northeast wind blowing in, that chills every one in the vicinity to the marrow, for two hours, in a thin muslin dress, without flinching.

She can dance or waltz down the captain of a marching regiment, and at the 11 o'clock supper put away lobster salad, ice cream, champagne, cake and coffee without flinching, sufficient for a week's nightmare to a strong man.

She can comb her hair all back so as to leave the roots to the full play of the December breeze, and wear a bonnet on top of a chignon, leaving ears and head exposed with impunity with the thermometer at ten degrees below zero.

She can pull over a thousand dollars' worth of dry goods for the investment of fifty cents.

She can study music for ten years, sufficiently to enable her to perform excellently, when not in the presence of those who desire to hear her.

She can balance herself on the ball of her great toe and shoe heel, the size of a dime, all day in the public streets without falling.

She can occupy three seats in horse car and be utterly oblivious that any of her own sex are standing up.

She shows unusual strength and firmness in the holding of real estate, solitaire diamonds, and other valuable property which her husband places in her hands previous to his compromising with his creditors at twenty cents on a dollar.—*Boston Com. Ad.*

A FRENCH ACTRESS WHO MAKES PASTIME OF SCULPTURE.

The last work (in the Paris Salon) I shall speak of is called "After the Storm." An old Breton peasant woman is seated on the seashore, her dead grandson on her knees, whom the waves have cast upon the beach, where she discovered him. The wind has blown her cloak and her chemise from her shoulders; the face, furrowed and despairing, is gloomily directed at the corpse; grief has added fresh wrinkles to those left by age on the troubled face still showing vestiges of former beauty. She is tall and robust, the child slim and rigged. The work is heartrending from its truth and sorrow. This strange and powerful work is sculptured by Sarah Bernhardt, the great actress of the Theater Francaise. It seems like a challenge thrown at the world of sculptors. Its effect is such that its traducers, unable to deny its ability, absurdly attribute it in turn to all the great sculptors of the day. The work produced considerable sensation before its appearance in public, and the sculptors desired to see this artist as she worked upon this group whose realism is so overwhelming. This work has been one of the great preoccupations of artistic Paris, and I have written of it in detail because it is at one and the same time a great sculpture and a great problem, for it is not yet two years since her engagement at the Theater Francais permitted the artist to begin the work; and those who have seen her at it are unable to explain the strange caprice of nature which permits a slim and pallid woman to be at the same time a great sculptor and a great actress.—*Letter in London Times.*

WOMAN'S WOUNDED AFFECTIONS.

Washington Irving wrote:—"As the dove will clap its wings to its side and cover and conceal the arrow that is preying on its vitals, so it is the nature of woman to hide from the world the pangs of wounded affection. With her the desire of the heart has failed. The great charm of existence is at an end. She neglects all the cheerful exercises that gladden the spirits, quicken the pulse and send the tide of life in healthful currents through the veins. Her rest is broken; the sweet refreshment of sleep is poisoned by melancholy dreams; 'dry sorrow drinks her blood,' until her feeble frame sinks under the last external assailant. Look for her after a little while and you find friendship weeping over her untimely grave wondering that one who but lately glowed with all the radiance of health and beauty should now be brought down to 'darkness and the worm.' You will be told of some wintry chill, some slight indisposition that laid her low; but no one knows the mental malady that previously sapped her strength and made her so easy a prey to the spoiler."

LOVERS' MISTAKES.

Many a man lives with a woman half a lifetime without suspecting that the wife of his bosom has really forgotten more than he ever knew. Many a carpet-knight, who plumes himself upon his wonderful skill in smashing hearts, is being mentally measured and intellectually turned inside out by the smiling girls whom he thinks he is captivating. Many a veteran beau, who pulls on his gloves to depart, feeling proudly conscious of having made a profound impression upon the susceptible soul of the belle who has endured him for the evening, would be wonderfully enlightened, if not edified, could he hear the sigh of relief which escaped her lips when the clang of the door announced his departure.

FOR AND ABOUT WOMEN.

The wife makes the home, and the home makes the man.

Out of 117 ladies in Michigan University, only four have taken to law.

The 200 women painters studying at Cooper Institute have earned $5,000 in the past year by painting pictures.

A writer on fashions says that New York young ladies still let their hair cascade over their foreheads in lunatic fringe.

Girls of Fulton County, Ill., had a sheep-shearing match the other day, and the winner sheared thirteen sheep in two hours.

Said an old Salt Lake City lady the other day: "A cord of wood 'd last us for a year, if I waited for my old man or my lazy boys to split it."

Miss Whateley's mission at Cairo employs a head native missionary, six male and six female teachers and a Bible woman. There are 150 boys and 130 girls in her schools.

A book entitled "Woman Created an Image of God" is now being published by Miss Aasta Hausteen, who is an enthusiastic worker for woman's rights in Norway. She is a daughter of the celebrated Prof. Hausteen.

Paris ladies who do their own needlework have adopted thimbles with a pebble inserted as a top. The agate, cairngorm, onyx and crystal are the most popular, as they look very pretty in their setting of silver.

Miss Antoinette Polk, a daughter of the late soldier-bishop of Tennesee—Leonidas Polk—and niece of the late President Polk, was a belle, last winter, of society in Rome. She is "The One Fair Woman" of Joaquin Miller's latest romance.

An Eastern young lady lately received the following note, accompanied by a "bucket of flours:"—"I send you bi the boy a bucket of flours. This is like mi luv for u. The nite shade means keep dark; the dog fenil means I am your slave; rosis red posis pall, my luv for u shall never fade."

The Paris fashion inventors are determined to make woman's life a burden to her. One of the journals of that city says that no glove will be tolerated in good society this season with less than twenty buttons, while another declares that in less than five years knee-breeches and six-inch skirts will be the fashionable street dress for ladies.

French statistics show that woman is six times less criminal against person, four times less criminal against property, and twice less hardened a criminal than man. The recently published record also proves that maternity is a better shield than paternity against bad life. Of 1,000 female criminals 261 are mothers, and of 1,000 male criminals 324 are fathers.

All the tired young men will now be for freeing the women. Susan B. Anthony, in her last speech, spoke substantially as follows:—"She thought that when the new dispensation were come a woman could woo a man and relieve him of the trouble of asking a certain question. Then a woman possessed of wealth and having a beautiful home and surroundings might be loved by a modest, poor young man, with a too high sense of honor to beseech her to share his poverty and she could say, 'will you?' etc., and relieve him of superfluous entreaty and give him a good home at the same time."

Reading for the Young.

A RHYME OF ONE.

You sleep upon your mother's breast,
Your race begun,
A welcome, long a wished-for guest,
Whose age is One.

A baby-boy, you wonder why
You cannot run;
You try to talk—how hard you try!—
You're only One.

Ere long you won't be such a dunce;
You'll eat your bun,
And fly your kite, like folk who once
Were only One.

You'll rhyme, and woo, and fight, and joke,
Perhaps you'll pun;
Such feats are never done by folk
Before they're One.

Some day, too, you may have your joy,
And envy none;
Yes, you, yourself, may own a boy
Who isn't One.

He'll dance, and laugh, and crow, he'll do
As you have done;
(You crown a happy home, tho' you
Are only One.)

But when he's grown shall you be here
To share his fun,
And talk of days when he (the dear!)
Was hardly One?

Dear child, 'tis your poor lot to be
My little son;
I'm glad, though I am old, you see,—
While you are One.

[*Cornhill Magazine.*

A BARBEROUS STORY.

The following humorous account of the way German barbers treat their victims is supposed to be written by a California boy to his home people:

I had my hair cut yesterday for the second time since I have been here. The barbers here must be licensed as professional torturers by the Government. I will describe the *modus operandi*, and I think that you will agree in my opinion of them. They seat you on a chair and then tie a kind of night-gown around you, taking care not to tuck it in at the neck, and then they commence operations with a grand flourish of a big pair of shears, which look large enough to cut your head off. They then proceed to cut the hair at the back part of the head. This is done in an artistic manner by pulling a couple handfuls of hair out by the roots and reducing the person being operated on to a state bordering on insanity. After having made the patient sufficiently nervous they begin operations around the ears. They go along pretty smoothly for a few seconds—just long enough to delude the poor fellow into the belief that his sufferings are at an end, when down comes the shears onto his ear, cutting off the tip and extracting a howl of pain and rage from the sufferer. The barber smiles blandly and assures him that it is nothing, only a scratch, and also tells him that he should have dodged the shears. The poor fellow now concludes that he will do his best to dodge the next cut, and successfully eludes six or seven well-directed blows, when the barber resolves on strategy. He gets directly behind the chair, places the shears in his right hand near the right ear of the person, then taps the left ear smartly with his first finger of the left hand. The victim immediately throws his head to the right to escape the expected blow on the left, when down comes the shears on the right ear, cutting a good-sized chunk off, at sight of which the barber sets up a shout of delight and dances around the room in a state of the greatest satisfaction.

He now proceeds to finish you off by cutting the front part of the hair, and every lock that he cuts off he throws directly in your face. Expostulation is useless, for the minute you open your mouth to say anything, you get a handful of hair thrown in, which effectually prevents further utterance. When he has entirely finished cutting your hair he takes as much as he can hold in both hands and deliberately thrusts it down your back, and under pretense of blowing the loose hair from off the coat-collar and neck he blows it further down. Then he releases the sufferer and receives his money with a polite bow and shows him to the door very nicely, leaving the person to wander home in a thoughtful mood and saying naughty words which are expressly forbidden in the Ten Commandments.

"GOD KNOWS ME, ANYHOW."

Frank had beautiful long hair hanging over his shoulders, and his parents were very proud of his appearance. One day he got his mother's scissors, went to the looking-glass and cut off all his fair locks. His father and mother were much displeased with him for so doing, and resolved to punish him in this way:

When they were at the dinner-table, his father pointing to him said to his mother, "What little boy is that?"

"I'm your little Franky, papa," he at once said, not giving his mother time to reply.

"Nonsense," was the father's answer, "my little Franky has beautiful long hair; I would not give my Franky for a dozen boys such as you."

Franky now turned to his mother and said, "Ain't I your little Franky?" but mamma only shook her head.

Matters were now looking serious, and Franky, becoming alarmed, could not make any progress with his dinner. He now appealed to his brother, and asked if he were not little Franky, but his brother only shook his head.

He was becoming very unhappy at the thought that father, mother and brother no longer recognized him, and at last burst into tears, saying as he did so, "Well, God knows me, anyhow."

Tears were now in other eyes as well as Franky's. Those who are near and dear to us may no longer own us, but if we are His children, "God knows us."

LETTERS FROM BOYS AND GIRLS.

From Up the Hudson.

Dear Mr. Editor:—I have been very much interested in the letters which the boys and girls have been writing for your paper, so I thought I would write one myself. I live on a farm a short distance from a large city, where my father has an office and I attend school. We go in and out on the cars every day. I take music lessons, and have lately learned to make wax flowers and like to make them very much. During the spring and summer I have very pleasant times playing croquet and riding horseback. I have a very nice saddle-horse by the name of "Rosa." Perhaps some of your readers would like to know how to make an imitation papier mache stand. Take a small stand of any shape, paint it black, glue bright-colored pictures all over it, leaving but little of the stand to show; then it has to be sized and varnished, and it makes a very pretty stand. I may perhaps be tempted to write again, telling you something of Cooperstown and Saratoga Spa, which I visited last summer.—Violet.

From an Eastern New York Girl.

Dear Cousins:—I am attending school this summer. I have three sisters and one brother, and we have a great deal of enjoyment with each other and with our young playmates. I have been visiting at my aunt's, and while there I attended a wedding. I feel very grateful to Uncles Mark and True for the intellectual treat contained in their letters.—Louise W., *Greenwich, N. Y.*

From a Fair Cousin.

Dear Rural Cousins:—I have thought for some time I would like to write and tell you how much I enjoy your letters and how well we all like the Rural. Father has taken it for nearly twenty years. I am a farmer's daughter, and live in the country three miles from Oneida Lake. I think that it is much pleasanter than living in the city. —Eve T., *Oswego Co., N. Y.*

From Schoharie Co., N. Y.

Dear Friends:—I live on a farm. My father takes the Rural, and we like it very much. I like to read the Boys' and Girls' Letters; I find them very interesting. I go to school in the winter and stay at home during the summer to work.—F. S., *Richmondville, N. Y.*

The Puzzler.

HIDDEN BIRDS.

1. Do not whip poor Willie this time, for my sake!
2. It is very easy to kill deer.
3. The fourth rush light only remained burning.
4. Come, little Kit, embrace me.
5. At the marriage of Cana, rye whisky was not used.
6. While sailing on the Umpqua, I lost a point lace parasol.
7. Come, Mag, pies are next in order.
8. I have lost my cat; Birdie thinks it was poisoned.
9. Jesse, Agulhas is a dangerous cape for sailors.
10. My dear mother, Carey's chickens were caught by a fox.
11. Have you read Clark's Commentary.
12. That hedge is of haw, Karl, my boy.
13. At noon the fish seemed to have a gold fin, Charles.
14. I love the solemn night, in gale or with summer zephyr.
15. Tubal, bat Ross Gay's ball, and thereby win the inning.

Bobo, link your chain to Rollo's collar.

☞ Answer in two weeks. Little One.

MELANGE.

1. Behead a river in the United states, and find a title.
2. Curtail the river, and find a fruit.
3. Syncopate the river, and find a sound.
4. Transpose the title, and find a Shakspearean king.
5. Transpose the fruit, and find to gather; again, and find to diminish.
6. Transpose the sound, and get a jump; again, and get an inclosure; again, and find an excuse.
7. Behead the excuse, and get a meadow.
8. Curtail the title, and find a part of the body.
9. Syncopate to gather, and get a blow.
10. Behead the inclosure, and get a liquor.
11. Curtail the fruit, and obtain a vegetable.

☞ Answer in two weeks. Isola.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

ADVICES are to hand confirming the news, and furnishing details concerning the fight between U. S. troops and a body of Sioux warriors June 25. It seems that a detachment of the 7th Cavalry under Gen. Custer was executing their part in a plan of combined attack and came upon some 4,000 Sioux near the Little Big Horn. The savages were in superior force and excellently armed. Custer rushed impetuously to the attack with five companies. The peculiarities of the field of battle left no alternative but fight, once engaged. After a heroic struggle the entire attacking force was annihilated. Gen. Custer, Col. Custer, Col. Yates, Col. Keogh, Col. Cook, Lieut. McIntosh, Lieut. Hodgson, Lieut. Smith, Lieut. Porter, Lieut. Harrington, Lieut. Calhoun, Lieut. Reilly, Lieut. Sturges and 269 men were slain.

Mr. Manager Lynde has opened the case for the people in the Belknap impeachment trial.

The colossal statue of Independence, which is being executed by M. Bartholdt for the purpose of serving as a lighthouse in the harbor of New York, will be finished, it is hoped, in time to be exhibited in Paris during the proposed exhibition in 1878. The wrist of this gigantic statue has been moulded lately. It took 200 sacks of plaster for its composition, and it weighs 5,075 kilogrammes. The Chronique states that it is intended to send this pretty little specimen of the intended statue to Philadelphia this summer. After the exhibition it will be brought back to France.

We have again to chronicle a fatal storm in Iowa. Dubuque and Rockdale are the severest sufferers. Houses, bridges, roads have been obliterated. Owing to the bursting of a millidam in addition to the torrents that poured down for three hours the village of Rockdale 27 miles from Dubuque is almost totally demolished. Nineteen dead and over forty missing is the sad commentary.

Mr. Morrill ex-Senator from Maine has accepted the Treasury portfolio.

The House Committee on Privileges and Elections adopted a report in the contested case of Breaux against Darroll, of Louisiana, giving the seat to Darroll; also, in the case of Butts against Mackey, of South Carolina, the committee report no election in either case, which ousts Mackey, the sitting member, from his seat.

Newspapers can be sent after July 1st at the rate of one cent for three ounces, instead of one cent for every ounce, as at present. The new postal law does not alter the postage on books, circulars, medicines, etc., hence it remains at one cent per pound.

The Wilmington (Del.) Commercial estimates this years' peach crop at 1,500,000 baskets.

Twelve States were represented by their Governors at the Centennial on the Fourth.

A novel feature of the celebration at Oswego was a grand sham naval engagement.

New Orleans manufactures 200 tons of ice daily, and Philadelphia 25,000,000 yards of carpet annually.

The senate, by a unanimous vote, has passed concurrent resolutions to complete the Washington monument.

Five hundred Scandinavians are on their way to join Brigham Young and Mormonism.

We should like to give Bayard Taylor's Poem as recited at Philadelphia on the Fourth, but its great length would preclude the announcement of current news of more present value to our readers.

California Apricots are in market.

Rochester, N. Y., is very mad because their fire works were such a fizzle. The papers speak of the display as the "pin-wheel" show, &c. and commiserate the long suffering tax-payer.

Mortimer F. Johnson, one of the early settlers of Rochester, N. Y., is dead.

Colorado will vote for President this year.

The New York Board of Health denounces black hats as provocative of sunstroke.

The first annual sale of trotting stock at the Fashion Stud Farm took place at Trenton, July 6. There was a good attendance and the sale was quite lively throughout. The stock brought good prices. C. H. Kerney, of New York, bought a yearling colt, Brown Star, sired by Gen. Knox, for $830, and Bay Star, a yearling colt out of Lucy, sired by Jay Gould, for $825. Mr. Robbins, of Philadelphia, bought Brown Star, dam Rosalind, sired by Gen. Knox, for $650. The rest of them ranged from $200 to $400. Twenty-seven head were sold.

There were over 50,000 paying visitors to the Philadelphia exhibition, the day after the 4th,—or more than in any day before.

The damage from bugs and other causes in wheat in Wisconsin is confined to small areas, and the yield will be large. Corn will fall below the average. The yield of oats, barley and rye promises to be unusually heavy.

Only 13,000,000 feet of lumber have been cut on the Androscoggin this year, against twice the amount last year.

The Moravia (N. Y.) Register says that a blight has appeared upon the fruit trees in that section, particularly the apple, which is likely to seriously affect the production of the fruit, if not the life of the tree.

The new whipping-post law in California for brutal husbands has not yet resulted in any floggings, the justices of the peace shrinking from the foolish barbarism. The case of one Reynolds, sentenced to receive twenty-one lashes, has been appealed, and the question of constitutionality will be raised. The State Constitution says, "Excessive bail shall not be required, nor excessive fines enforced, nor shall cruel or unusual punishment be inflicted."

A contractor bargained to build a house in Scranton, and means to earn and get the pay; but the other party changed his mind, and is determined that the work shall not be done. Every day the contractor has framework put up by a large force of workmen, and every night the owner of the ground hires an equal number to clear away the timber. The expense to the contestants is great, but each is satisfied because he expects that the law will make the other pay the cost; and the workmen are contented because most of them are employed on both the night and the day job.

The race of American horses against the time of 150 miles in seven hours, made by Peralto, with mustangs, took place Monday week, at New York, John Murphy, the well known jockey, riding. Murphy won in fine style—time six hours and fifteen minutes.

Mr. W. H. Sanford's annual sale of thoroughbred yearlings has taken place at his farm near Lexington, Ky. Thirty-six head realized $25,095, an average of $697, making it the best sale that has ever taken place in the United States. The highest prices were paid by O. H. Bernard of New York, for a bay colt by imported Henely, $3,325; same for chestnut colt by imported Henely, $3,305; A. Cammack of New York, for a bay filly by imported Henely, $2,700.

A boys' newspaper in Indianapolis is ten cents a year, and "anybody sending three names and thirty cents will receive a set of jack-stones."

A scheme for the complete exploration of the silver-lead region of Lake Superior is on foot.

Chicago finds itself on the brink of a chaos which threatens more damage to that city's credit than even the great fire. It has no money in the municipal treasury, the police and fire departments cannot be paid because people will not pay taxes, owing to a state law which gives no compelling power to the authorities.

Foreign born women who intended to vote for school commissioners in Minneapolis, Mo., forgot to get naturalized, and so lost the privilege.

The following congratulatory letter from the Emperor of Russia reached this country too late to be presented to the President by the Russian Minister on July 4, and has since been presented:

MR. PRESIDENT: At a moment when the people of the United States celebrate the Centennial period of their national existence, I desire to express to you the sentiments with which I take part in this celebration. The people of the United States may contemplate with pride the immense progress their energy has achieved within the period of a century. I especially rejoice that, during this Centennial period, the friendly relations of our respective countries have never suffered interruption; but, on the contrary, have made themselves manifest by proofs of mutual good will. I therefore cordially congratulate the American people, in the person of their President; and I pray that the friendship of the two countries may increase with their prosperity. I embrace this occasion to offer to you, at the same time, the assurance of my sincere esteem and of my high consideration.

Ems, June 5, 1876. ALEXANDER.

To His Excellency, Gen. Grant.

Castle Garden, N. Y., has been destroyed by fire. In view of the historic importance of the edifice, we give unusual space to a description of the building:—Castle Garden was one of the very few remaining landmarks of old New York. Its history is linked with that of the city, and its traditions still linger in the memories and hearts of those who have enjoyed themselves there, or first found shelter on this continent within its walls. Originally constructed on the north side of the Battery as a fort in the system of fortifications to defend the city from the attack of Indian and invader, it served its purpose, and when its services as a fort were no longer needed, its grim visage was smoothed, and pleasure took possession of the halls formerly trodden by soldiers. On the heavy granite foundation which constituted the fort, a tall and commodious wooden structure, circular in form, and crowned with a cupola, was erected. Its attractive situation, and the fact that it was the only public building of any consequence at the time, made it to old New York what the Academy of Music is to the present day. Jenny Lind first sang to delighted American audiences within its walls, and Jullien, then prince of orchestra leaders, waved his baton there. Fairs and festivals succeeded each other, and the building was occasionally varied by a grand ball or occupied by a public meeting. The Marquis de Lafayette, upon his return to the United States in 1824, when the American people were in the full enjoyment of the independence to which he had so largely contributed, was received there with the highest social distinction and amid a blaze of patriotic enthusiasm. The wealth and fashion, youth and beauty of the metropolis were there to greet him, and the event was one never to be forgotten in the annals of old New York.

When the lower part of the city began to deteriorate and staid old Knickerbockers preferred the vicinity of Bleecker St. to the charms of Bowling-green, the Battery began to lose caste, and Castle Garden prestige. The beauties who had once lounged on the balcony which overlooked the delightful waters of the Bay, now began to find fault with the old temple of social pleasure. It had lost favor, and Broadway began to furnish fresher attractions, and Castle Garden, as a pleasure resort, was doomed. It passed through several hands, and when the city authorities resumed an active control of the structure it was determined to convert it into a depot for the reception of the thousands of emigrants who began to flock to these shores. Placed under the control of the Commissioners of Emigration, it grew in usefulness year by year. What it gained in utility, however, it lost in beauty. Heavy wooden shoes echoed through the building once ruled by Catharine Hays, and strange tongues now made Babel where the dainty nothings of old New York were exchanged. Rude partitions replaced cushioned seats and stalls, and dingy painting contrasted painfully with the bright colors of the olden time.

As the emigration continued to increase, so did the facilities provided for the care of the emigrants. The auditorium was divided into spaces for telegraph offices, exchange bureaus, a post-office, and bureau of information. Lavatories of considerable capacity, and retiring rooms and offices were arranged. Great sections of the building were reserved for the seating of emigrants, and there they were left until the arrival of their friends or their departure to their destinations. Interpreters were provided, and employment bureaus established for both sexes. All unauthorized persons were excluded, and the shameless frauds which had been practiced upon emigrants were stopped. Outside of Castle Garden the landing which had been used by pleasure-boats now did service for the emigrants. Vessels plied between the wharf and the ocean steamer, and the emigrants and their baggage were received and examined within the jurisdiction of the Emigration Commission. As business increased a few plain wooden buildings for offices were erected outside of the old fort, and those, escaping destruction, furnished loding places for immigrants.

Five hundred and sixty acres of the battlefield of Perryville, Ky., have been advertised for sale by the Commissioners of the County Court. This is one of the historic battlefields of the war.

Gov. Hayes has written his letter of acceptance.

Official returns made to the Bureau of Statistics show that during the month ending June 30, 1876, there arrived at the port of New York 14,030 passengers from foreign countries. Of this number 10,558 were immigrants, 2,453 citizens of the United States, and 1,019 persons who did not intend to reside in the United States. Of the total number of immigrants 6,003 were males and 4,555 females. The countries or islands of last permanent residence or citizenship of the immigrants were as follows:—England, 1,704; Scotland, 291; Wales, 28; Ireland, 1,837; Germany, 2,566; Austria, 744; Sweden, 734; Norway, 623; Denmark, 151; France, 246; Switzerland, 154; Spain, 96; Italy, 283; Holland, 78; Belgium, 18; Russia, 617; Hungary, 43; Poland, 82; Turkey, 7; China, 24; Canada, 13; Nova Scotia, Barbadoes and Bermuda, 10 each; New Brunswick, 3; Venezuela, 12; Liberia and Cuba, 14 each; Sicily, 19; Russia-in-Asia, 83; East Indies, 7; Gibraltar, 5; Arabia, 9; Greece, South America, Peru, St. Thomas, St. Croix, Egypt and India, 2 each; Portugal, Brazil, United States of Colombia, New Granada, West Indies, Mauritius, Guadaloupe, Madeira and born at sea, 1 each. The total number of passengers who arrived at New York during the quarter ending June 30, 1876, was 59,936, of whom 50,461 were immigrants. During the corresponding period of 1875, 53,923 passengers arrived, of whom 45,566 were immigrants.

Peter has an imitator, in some respects, in the person of Henry Dussault of Georgia, who walks on the water of the Oswegatchie river. His faith is in tin shoes, five feet long, a foot wide and a foot deep.

The Blaine investigation has been resumed.

The following is Gen. Terry's official report of the battle near the Little Big Horn:

It is my painful duty to report that day before yesterday, the 25th instant, a great disaster overtook General Custer and the troops under his command. At 12 M. of the 22d he started with his whole regiment and a strong detachment of scouts and guides from the mouth of the Rosebud. Proceeding up that river about twenty miles he struck a very heavy Indian trail, which had previously been discovered, and pursuing it found that it led, as it was supposed that it would lead, to the Little Big Horn. Here he found a village of almost unlimited extent, and at once attacked it with that portion of his command which was immediately at hand. Major Reno, with three companies, A, G and M, of the regiment, was sent into the valley of the stream at the point where the trail struck it. General Custer, with five companies, C, E F, I and L, attempted to enter about three miles lower down. Reno forded the river, charged down its left bank, and fought on foot, until finally, completely overwhelmed by numbers, he was compelled to mount, recross the river, and seek a refuge on the high bluffs which overlook its right bank.

Just as he recrossed Capt. Benteen, who, with three companies, D, H and K, was some two miles to the left of Reno when the action commenced, but who had been ordered by Gen. Custer to return, came to the river, and rightly concluding that it was useless for his force to attempt to renew the fight in the valley, he joined Reno on the bluffs. Capt. McDougall, with his company (B), was at first some distance in the rear with a train of pack-mules. He also came up to Reno. Soon this mounted force was nearly surrounded by Indians, many of whom, armed with rifles, occupied positions which commanded the ground held by the cavalry. Rifle pits were dug and the fight was maintained, though with heavy loss, from about 2:30 o'clock of the 25th till 6 of the 26th, when the Indians withdrew from the valley, taking with them their village.

Of the movements of Gen. Custer and the five companies under his immediate command scarcely anything is known from those who witnessed them, for no officer or soldier who accompanied him has yet been found alive. His trail from the point where Reno crossed the stream passes along and in the rear of the crest of the bluffs on the right bank for nearly or quite three miles; then it comes down to the bank of the river, but at once diverges from it as if he had unsuccessfully attempted to cross, then turns upon itself, almost completing a circle, and closes. It is marked by the remains of his officers and men and the bodies of his horses some of them strewed along the path, others heaped where halts appear to have been made. There is abundant evidence that a gallant resistance was offered by the troops, but they were beset on all sides by overpowering numbers.

The officers known to be killed are General Custer, Captains Keogh, Yates and Custer; Lieutenants Cook, Smith, McIntosh, Calhoun, Porter, Hodgson, Sturges and Reilly, of the cavalry; Lieutenant Crittendon of the Twelfth Infantry, with Acting Assistant Surgeon De Wolf, Lieutenant Harrington, of the cavalry, and Assistant Surgeon Lord are missing, Captain Benteen and Lieutenant Varnum, of the cavalry, are slightly wounded. Mr. B. Custer, a brother and Mr. Reed, a nephew of General Custer, were with him and killed. No other officers than those I have named are among the killed and wounded and missing.

It is impossible yet to obtain a reliable list of the enlisted men who were killed and wounded, but the number of killed, including officers, must reach 250. The number of wounded is fifty-four. The balance of the report will be forwarded immediately. A. H. TERRY, Brigadier General.

So great has been the heat of the sun that the First New Jersey Brigade, who were in summer encampment, have been compelled to return to their homes. Over 200 men were prostrated, some fatally.

The Fitchburg, Mass., House of Correction has been consumed by fire.

A Chicago surgeon, called in the night to perform an operation, put the necessary instruments in a bag and started. A policeman stopped him, examined the contents of the bag, refused to believe that they were not burglar's tools, and arrested the surgeon.

The general fees of lecturers are about as follows:—Bayard Taylor, $125; Mrs. Scott Siddons, $150; Bret Harte, $125; Theodore Tilton, $150; Carl Schurz, $200; Nasby, $100; Mrs. Livermore, $100; Susan B. Anthony, $60; Ann Eliza Young, $100; Mark Twain, $200; Elizabeth Cady Stanton, $75; Lillian Edgarton, $75; Dr. J. J. Villers, $75; Thos. Nast, $150.

The Brooklyn Navy Yard is now in the possession of two or three watchmen and a company of marines, all the hands, including the band, having been discharged.

The Sea Cliff camp-meeting has been formally opened.

FOREIGN NOTES.

THE Paris exhibition in 1878 will cover Trocadero Heights and the Champ de Mars, and these places separated by the river, will be connected by two bridges across the Seine. Paris has voted $24,000,000 for improvements.

Servian troops having fired at an Austrian vessel on the Danube, the Consul-General of that power, has demanded satisfaction, meanwhile the Montenegrins are neutral, deeming it the better

part of valor to wait and see what the Servian chance of success is before pronouncing for them.

The French Ministry has been defeated in the Chamber of Deputies and Convicts who have the inclination and ability may now write for the papers. Dissensions are reported among the Republicans.

There are in London 8,000 children dependent on poor law relief, having either no homes at all, or no shelter but wretched dens that cannot by any euphemism be called homes.

Brittish employers purpose reducing wages in the cotton and coal trades.

The Emperors of Austria and Russia had a friendly interview in Bolicmia.

The following is a translation of a letter of congratulation sent by King William to the United States:

William, by the grace of God, Emperor of Germany, King of Prussia, etc., etc.

To the President of the United States:

GREAT AND GOOD FRIEND: It has been vouchsafed to you to celebrate the Centennial festival of the day upon which the great Republic over which you preside entered the rank of independent nations. The purposes of its founders have, by a wise application of the teachings of the history of the foundation of nations, and with insight into the distant future, been realized by a development without a parallel. To congratulate you and the American people upon the occasion affords me so much the greater pleasure, because, since the treaty of friendship, which my ancestor of glorious memory—King Frederick II.—who now rests with God, concluded with the United States, undisturbed friendship has existed between Germany and America, and has been developed and strengthened by the ever-increasing importance of their mutual relations, and by an intercourse becoming more and more fruitful in every domain of commerce and science. That the welfare of the United States and the friendship of the two countries may continue to increase is my sincere desire and confident hope.

Accept the renewed assurance of my unqualified esteem. (Signed) WILLIAM.

(Countersigned) VON BISMARCK.

Berlin, June 9, 1876.

Isaac Butt, the Home Ruler, will move for the pardon of Fenian convicts in the House of Commons in the near future.

M. Casimer Perier the distinguished French Statesman is dead.

Advices from Mexico report the death of Gen. Santa Anna.

The Turks claim to have defeated the Servians near Novi-Bazar. The Turkish troops are reported to have crossed the Drina.

Reports from the seat of war in Europe are so conflicting that it is quite difficult to summarize the progress of the fray. Christians and Turks claim victories in identical localities. The last fight at Saitschar is officially claimed by the Turks.

An explosion of firedamp has occurred at l'Hopital Colliery near Saint Avold, France. Forty-two persons were killed and 47 seriously injured.

During the debate on the budget in the Congress, Madrid, Senor Morales, a Deputy from Navarre, moved an amendment excepting that Province from the general system of taxation. Senor Cadvros del Castillo, on the part of the Ministry, opposed the amendment, and it was rejected by a vote of 117 against 11. The result is regarded as a vote of confidence in the Government, and as deciding the question of the "Fueros."

A Dublin correspondent telegraphs that the Irish Ride Team will sail for New York in a steamer of the White Star line about the 21st of August, embarking at Queenstown.

The Merchants' Shipping bill passed through the committee in the House of Lords. Lord Carlingford expressed gratification that the Government had adopted the Canadian deck-load rule, thus avoiding any clashing with the Canadian law.

The question of postponing the International Exhibition of France, fixed for 1878, is seriously considered.

The Japanese make bricks of such quality that they pay freight on them for 9,000 miles, pay twenty per cent duty, and sell them in San Francisco at a profit.

It is said that the Pope, in his nice white clothes, with his fresh, healthy face, handsome hands, and thoroughly well-kept appearance, looks like a hearty, fat baby, just out of the morning nursery toilet, and the white skull cap and silvery hair to add to this illusion.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 8, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	63,500	Molasses	83
Whisky	—	Rice, bbls	145
Corn meal, bbls	—	Cut meats, pkgs	10,193
Corn meal, bags	—	Lard, pkgs	7,930
Wheat, bush	754,000	Tobacco, hhds	4,443
Corn, bush	534,100	do. cases	3,450
Oats, bush	266,000	Butter, pkgs	23,611
Rye, bush	41,000	Cheese, bxs	59,313
Malt, bush	64,000	Cotton, bales	6,585
Barley, bush	12,000	Rosin	14,517
Beans, bbls	64,000	Sots. turp., bbls	2,262
Grass seed, bush	100	Dried Fruits, pkgs	21
Beef, pkgs	855	Eggs, bbls	8,161
Wool, bales	1,297	Peanuts, bags	669
Hops, bales	827	Leather, sides	68,335
Pork, bbls	867	Sugar, hhds	—
Tallow	1,415	Oil cake	12,278

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week 633 bbls.; since Jan. 1st, 34,857 do.; same time last year, 15,057 do. Exports of peas past week, 7,585; since Jan. 1st, 230,100 bush.; same time last year, 218,250 do. Hot weather, heavy receipts and a moderate demand do not help prices for beans of any description. Marrows show an important decline during the past fortnight, and Mediums and all others are quoted at the extreme. Canadian peas are quiet at quotations.

Beans—Prime pea, $1.15@1.20; fair to good, $1.00@1.10; prime mediums, 90@95c.; fair to good, 70@80c.; poor, 40@50c.; prime marrows, $1.30@1.35; fair to good, $1.10@1.20; prime white kid, $1.20@1.30; other, $1.00@1.10; prime red kidney, $1.20@1.40; other, $1.15@1.25; Lima (Cal.), $2.75@3. Black beans, $3.75@4. Peas—Canadian, $1.18@1.20; do. in bulk and bond, 95@98c.; green, $1.00@1.10; Southern B. E., 2-bush. bag, $2.65@2.70; split, ₱ bbl., $6.

BEESWAX.—Demand small and prices are unsettled and easier. Sales at 34c. for Western, and 34½@35c. for Southern. Exports since Jan. 1st, 38,350 lbs.; same time last year, 40,100 do.

BROOM CORN—Is hard to sell and easy in price. Brush, short green, 8½@10c.; hurl, green, 8½@10c.; medium, green, 5@5½c.; red and red tipped, 3@4c.

BUTTER.—Trade has not revived from the lull that attended the national celebration and we can only report low nominal quotations. Fancy pails and finely kept half tubs have a daily trade in a small way; of the 21@22c. stock there is some accumulation. Receivers discourage shipment while the weather is so extremely detrimental to transportation choice creamery and other fine fresh made butter is not plenty; want of rain begins to be severely felt in our close eastern sections; Other points report rich pasturage and the indications are that there will be an unprecedented yield. Western butter is abundant and largely damaged in quality owing to the intense heat, and when the recent invoices are opened there will be many rejections.

We quote:—Choice pails, 24@25c.; prime, 23@24c.; poor to good, 18@22c.; creamery pails, choice, 25@26c.; good, 24@25c.; sweet cream pails, 20@24c. State firkins, choice, 24@25c.; fair to good, 21@23c.; do. half firkin tubs, choice, 23@24c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 22@24c.; other, 18@21c.; Western creamery, choice, 23@24c.; other, 21@23c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 18@19c.; other, 12@14c.; factory choice, 16@17c.; other, 11@14c.

CHEESE.—Receipts have been smaller this week, yet a very depressed feeling has existed. The advices from the other side have been unfavorable and exporters have bought very sparingly, with the prospect of carrying over more than usual, a nervous feeling prevails as regards prices most marked on other than fine lots. Best factories are 10½, but about fine can be had at 10 and anything under this relatively low. The quotations are:

New at 10½@10¾c. for fine factory; 9@9¾c. for good; 8@9c. for fair; do., half skimmed, 5@7c.; do., skimmed, 3@5c. State farm dairy, fair to good, at 7½@8½c.; poor lots, 5@6c.; Western factory, good to prime, 7@8c.; fair lots, 6@7c.; do. cheddar, choice, 8½@9c.; do. flat, choice, 8½@8¾c.

Exports past week, 62,024 lbs.

COTTON.—Export movement is very light and prices unsettled and lower. Latest sales are:

11 19-32c. for July; 11 13-32@11½c. for August; 11 9-16@11 19-32c. for September; 11 11-32@11¾c. for October; 11½@11 23/32c. for November and December; 11 13-32@11 7-16c. for January; 11 9-16@11 19-32c. for February; 11 23-32@11¾c. for March; 11 27-32@11 29-32c. for April; 12@12 1-32@12c. for May; June, 12¾@12 5-32c., barely steady.

Quotations for spot cotton, based on American standard of classification:

Stained.

Good ordinary	8¾	Low middling	10
Strict ordinary	9¼	Middling	10¾

DRIED FRUITS.—Important trade is at a pause, and it is difficult to sell even small lots, with prices weak generally.

Apples—State, sliced, 8½@9c.; do., quarters, 8½@8¾c.; southern sliced, 8@9c. for prime; blackberries, 9@9¾c. Peeled peaches, good and prime Georgia, 10@12c.; do. fancy, 14c. Unpeeled peaches, new, 11@11¾c. for halves and 10c. for quarters. Plums, 14@15c. Raspberries, 25@26c. Cherries, 17@18c.

EGGS.—When stock is extra fresh sellers can do a little better than our extremes, but the general market is dull and prices have fallen off. The supply is not heavy, but the weather is against holding, and there are many ready sellers. We quote, loss off:

Near points, 17½@18c.; State and Penn., 16½@17c.; Western, prime, 16c.; do. other, 15@15½c.; Canadian, 16½c.

ESSENTIAL OILS.—Oil Peppermint, in glass, $3.75 ₱ lb.; in tin, $3.25. Spearmint, in glass, $3.50; in tin, $3. Wintergreen, $3. Sassafras 55c.

FEATHERS.—Common poultry feathers not wanted. We quote prime live Western geese, 52@55c.; mixed, do., 35@45c.

FLOUR.—Advices from the other side are tame, and there are free sellers here at easier figures. $3 40@4 10 for poor to very choice superfine State; $4 70@5 00 for very common to fair extra do.; $5 05@5 10 for good extra do.; $5 15@5 20 for fancy do., and $5 25@5 75 for very choice extra; $3 40@4 10 for superfine Michigan, Indiana, Iowa, &c.; $4 70@5 05 for shipping extra do., the inside price for inferior, and $5 10@5 50 for choice to very fancy extra do.; good to choice white wheat extras at $5 55@6 80; fancy do. $6 85@7.75; winter wheat, good to choice family city mill extras, $7.50@8.75; round-hoop Ohio, $4.80@5 00, and trade brands of do. at $5.05@7.00; St. Louis, $5.10@5.20 for common to fair extra, and $5.25@8.75 for good to very choice; Minnesota "straight" at $5.25@6.00, and patent at $5.75@9.00; unsound stock at from $3.25@5.50; No. 2 at $2.25@3.00; city mill at $5.00@6.00. Southern at $4.95@5.15 for common to good extra, $5.20@6.00 for good to choice, $6.05@8.50 for family extra. Rye at $4.75@5.15. Corn meal, Western yellow $2.60@3.00 and Brandywine $3.25@3.35.

FRESH FRUITS.—The supply of summer fruits is large and varied, including contributions from the the Pacific coast. California peaches did not carry well. The pears—quoted $1@2 per box—were not of an inviting quality. Norfolk peaches quoted $2.50@3 per crate. Southern apples are in good demand when prime. Cherries are running out. We quote:

Norfolk apples, crate, 75c.@$1.25; do. bbl., $1.50@3.50. Wilson blackberries, quart, 13@15c. Dorchester do., 8@10c. Common do., 3@5c. Whortleberries, bush., $2@3.50. Raspberries, Antwerp, 3ds, 4@5c.; do. Brandywine, 3@4c.; do. Black-Caps, 3@5c. for fair to good, and 7c. for choice. Cherries, 5@10c. Gooseberries, $1@1.50 per bush. Currants, small, 3@6c.; do. cherry, 6@8c. Florida watermelons, $25@40 per 100. Hot-house grapes, lb., 75c.@$1 for Black Hamburg. Peanuts—Virginia, bush., $1.40@1.65; Wilmington, $1.50@1.60; Tennessee, $1@1.20.

GINSENG.—Southern, $1.50@1.60; Northern, $1.15@1.20; Seneca root, 75@80c.

GRAIN.—For wheat prices have been reduced daily since our last, with dull markets abroad and but little doing here. Latest sales for ungraded spring, 95@98c.; No. 3 Chicago spring, 95@98c.; No. 3 Milwaukee spring, $1@1.04; No. 2 Chicago spring, $1.10@1.13; No. 2 Milwaukee spring, $1.12@1.16; very good No. 1 Minnesota spring, $1.25; soft, $1.16@1.17; No. 3 winter red Western, $1.10; New York no-grade winter red Western, 90@92c.; amber State, $1.35. Rye at 80c. for Western, 90@92c. for Canada. Corn is lower and dull; sales at 50@52c. for unsound mixed Western; 48c. for hot do.; N. Y. steamer, 56@56½c.; ungraded mixed, 54@58½c.; low mixed, 57½c.; mixed, 58c.; N. Y. No. 1, 58½c.; white Western, 61c. Oats sell slow and easy in price; closing sales at 28@31c. for unmerchantable; 32@41c. for mixed Western and State; 35@45c. for white do.; 32@33c. for New York rejected; N. Y. No. 3, 30½c.; N. Y. No. 2 white, 37c.; N. Y. No. 2 Chicago, 39½@40c.; mixed Western, 30½@40c.; white, 33@41c.; white State, 43@45c.; mixed State, 40@41c.

HAY AND STRAW.—The market is liberally supplied and prices unsettled favoring the buyer.

Bale hay is quoted:—Shipping, 65@70c.; retail qualities 80@85c.; clover, 50@55c.; salt, 60@65c. Straw is quoted at $1.15@1.20 for long rye; 75@80c. for short rye; 55@65c. for oat.

Exports past week, 191 bales; since Jan. 1st, 29,923 do.; same time last year, 24,717.

HIGHWINES.—Quoted at $1.12.

HOPS.—This has been a very dull week, partly owing to the holidays, but in most instances attributed to a disposition to hold off awaiting developments respecting the new crop. Prices generally held as before. The quotations are:

N. Y. State, 10@17c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c., ₱ lb.

POULTRY AND GAME.—Dressed poultry is quoted in a moderate way as follows:

Fowls, 14@15c. Spring chickens, 26@30c. Turkeys, 14@17c. Prime live fowls and chickens is in good demand. Turkeys show. Ducks fine. Young Geese inquired for.

Fowls, N. J., ₱ lb 15@16c.; do. Western, 14@15c. Roosters, 8@10c.; Turkeys, N. J. 13@14c.; do. Western, 13@14c.; Ducks, N. J., pair, $1@1.12; do. Western: 60@70c.; Geese, N. J., $1.75@2 50; do. Western, $1@1.75. Spring chickens—Western, 31@33c.; do. N. J. 23@25c.

Woodcock opened at 90c@$1.00 ₱ pair and have delivered to 60@75c. the latter for state. Baited Wild pigeons ₱ doz. $1.25@1.37. Stall-fed ₱ doz. $1.50@$1.75.

PROVISIONS.—Hog products generally are slow of sale, exporters, in most instances holding off; but there does not appear especial pressure to sell. Mess pork quoted at $20.20 for spot lots, $20 for July; $20.10 for August. Bacon at 10¾@10¾c. for long clear and 11¾c. for short clear—the latter very scarce. Western steam lard at $11.55 for spot lots; $11.20 for July and August and $11.60 for September. Western stearine at 13¾c. for prime. Tallow at 8¼c. for prime. Beef hams at $22@24. Beef at $10@11 for plain mess; $12 for extra mess, and $13 for packet. Tierced at $19 for prime mess, and $20 for India mess. City extra India mess at $20.

SEED.—Nothing doing in grass beyond small lots prime store. Quoted at 16c. for clover; timothy, $2.80@2.85.

TOBACCO.—There is a better export demand and firm prices.

VEGETABLES.—Few good L. I. potatoes have yet arrived and Southern still leads the trade. Dry weather has cut down all supplies from near points. We quote:

Potatoes—Bermuda, ₱ bbl., $4@4.50; Norfolk, $3@3.50; L. I., $2.50@3. Green corn is early and plenty; 75c.@$1 ₱ 100 for Burlington. Charleston tomatoes, ₱ crate, 30@40c.; Norfolks arrive heavily—the Norfolk steamer had 7,000 crates; quoted at 50@75c. L. I. green peas, ₱ bag, 75c.@$1; do. string beans, wax, ₱ bag, $1.50@1.75. do. cucumbers, $1.25@1.50 ₱ 100; Norfolk do., ₱ bbl., $1.50@2.25. Cauliflower, ₱ bbl., $1.50@3.50. Cabbage, ₱ 100, $7@8. Potato onions, $1.50@2.50 ₱ bbl. Va. white onions, $2.50@2.75.

WOOL.—Prices are as last week. There has been very little done, chiefly owing to the holidays.

ROCHESTER, July 8.—Flour market dull; spring, $6.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.20@1.26; amber winter, $1.18@1.23; white winter, $1.22@1.33. Oats, nominal at 35@40c. Corn quiet at 55@60c. Corn meal, $1.30@1.35. Butter, 19@21c. Cheese, 11@13c. Eggs, 13@14c. Lard, 11@12¾c. Apples, bu., $1@1.75. Potatoes, bu., $1@1.25. Beans, ₱ bu., 50@90c. Mess pork, $22.00. Wool, 20@35c. Hay, $8@12. Straw, $6@8. Timothy seed, $2.75@3.; clover, $9.25@10. Mill feed dull at $14 for shorts, $16 for shipstuffs, and $19 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c. Wood, hard, ₱ cord, $8@9. Coal, $6.50@6.90 for stove.

MILCH COWS.—Trade slow and generally effected in lots that had been held over. Thirty cows sold at $60@65 ₱ head; 10 at $50@62; 10 cwt., $65@170; 8 cows at $42@50 ₱ head, calves included.

VEALS AND CALVES.—Buttermilk-fed calves sold at 4@5c.; ordinary quality at 5@7¾c.; smooth quality veals in light receipt and sold at 8c. State calves, including 8 head of veal, sold at 4@8c.; Jersey calves sold at 7@7¼c.; Pennsylvania, 7@7¾c. Trade slow at above rates.

SHEEP AND LAMBS.—Sheep very slow of sale at ¼c. ₱ lb. reduction on our last quotations. Good quality lambs in fair demand. Monday, sheep, 5@5¾c.; lambs, 6¾@10c. Wednesday, sheep, 4¾@5¾c.; lambs, 6¾@8¾c. Thursday, sheep, 4¾@5¾c.; lambs, 6¾@9¾c. Friday, the markets closed slow; sheep, 4¾@5c.; lambs, 6½@8¾c. State sheep, 5@6c.; Kentucky, 4¾@5c.; Ohio, 4¾@5c.; Michigan, 4¾c.; Illinois, 5¾@5¾c.; Virginia lambs sold at 6½@10c.; Jersey, 7@8¾c.; Kentucky, 6¾@8¾c.

HOGS.—A few head of Ohio hogs stood over on sale for several days and were then disposed of on private terms. City dressed not quoted until noon on Wednesday; when they opened, trade improved on a light run. Friday, sales fair at 8@8¾c.

HORSE MARKET.—City trade did not exist on the early days of this week; later on, sales were effected as follows:—One pair stylish carriage horses, $1,400; 3 pairs family do., $100@525 ₱ pair; 11 head roadsters, with fair trotting action, $280@295 ₱ head; 20 head of poor quality light harness horses sold at $15@90 ₱ head; 15 ordinary, $132@195 ₱ head; 7 course quality heavy draft horses, $115@175 ₱ head; 1 brougham horse, quality course, $300.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., July 8, 1876.

THE occurrence this week of Independence Day operated against the delivery and marketing of dairy products. This has been the general rule on Fourth of July week for several years past, and but few transactions were expected.

The delivery of farm dairies was about 100 boxes, which sold at 9@10c., only one or two lots, however, reaching the last figure.

Factories were well represented, but the majority of salesmen present came to the market more to learn the ruling rates than to sell. The delivery of factory cheese on Monday amounted to nearly 1,000 boxes. A part of this went forward on commission, and a part was sold at prices to be regulated at next week's sales. The market was dull and buyers did not care to offer much above 10c. A few lots have been sold at this price, and 10¼c. was the highest rates reported, though the best factories refused to sell below 10½c.

There was a light delivery of butter, that from farm dairies bringing 22@23c., according to quality, and no creamery in market.

Grass is abundant in pastures, the frequent showers favoring its growth.

We have advices from abroad for the third week in June. Our London correspondent says that new American cheese sells as fast as landed and is likely to be in request for some weeks to come. The quality of that to hand is good. Fine old American cheese is wanted and 70s. is paid for it. The reports of new English cheese are discouraging, both as to make and quality, owing to the backward season. Dutch cheese is slow of sale. We give prices as follows:

American, extra fine, none in market; fine, 60@68s.; good, 40@58s.; secondary and common, 25@35s. English cheddar brings 84@96s.; Wiltshire double, 70@78s.; Cheshire medium, 51@61s.; fine, 76@84s., Scotch, 60@66s. Dutch cheese—Edams, new milk, 56@58s.

Friesland butter sold at an advance of 12s. ₱ cwt., but Normandy went at a reduction of 4s. Other descriptions are firm at previous rates. Dorsets, 136s.; Jersey, 106@112s.; Danish and Swedish, 112@130s.; Normandy extra, 112@132s. There is no American or Canadian butter in market. Oleomargarine (or artificial butter) sells at 80@96s. ₱ cwt.

Pump water from WELL, SPRING or RIVER, and force it to any height or locality, for HOUSE, GARDEN, BARN or STOCK use; also grind feed and meals, saw wood, &c. Greatest invention of the age. A wind mill that does not blow away. Perfectly self-regulating. A solid wheel with no loose sections or joints. Can not freeze up or get out of order. AWARDED 9C 1st premiums. Illustrated Circulars free.

Eclipse Wind Mill Co., Beloit, Wis.
Eastern office, A. J. COCHRAN, 76 John St.,

PERSONAL ITEMS.

EDWIN BOOTH will make Chicago his home.

SAY, "I will," and some day you will conquer.

HENRI ROCHEFORT has dropsy and heart disease.

MARK TWAIN is out in favor of a land of plenty and plenty of land.

O'DONOVAN-ROSSA has collected over $10,000 for the "skirmishing fund."

MORE costly than a rare vase—a base-ball pitcher at $2,000 per year.

MR. SANKEY, the singer, is a guest of Gen. Clinton B. Fisk, at Seabright.

CHICAGO pickpockets "work" funerals, and make a dead sure thing of plunder.

THE French Amateur Society of San Francisco have given Fechter a benefit.

TAXIDERMY for parents—If you want to preserve your children do not stuff them.

"No matter what you do all the week, if you go to church Sunday," is a bad motto.

ABOUT the greediest thing known is a fowl eating corn; it takes a peck every time.

THAT new London drink, "stout and bitter," is now called "mother-in-law" for short.

IT is rumored that Miss Bennett, sister of J. G. Bennett of the Herald, is about to become a nun.

THE Empress of Germany thinks that women should have more to do with politics than they have.

MISS ABBOTT, the Boston singer, importuned the Pope to bless her voice, and he instead advised her to pray.

JOSEPH ARCH, the British reformer, has been elected President of the Agricultural Laborers' Association of England.

OF the Americans on the staff of the commander of the Egyptian expedition into Abyssinia, three were killed and eight wounded.

INSURANCE companies in several cities sent out postal cards upon which advice as to preventing fires on the Fourth was printed.

ROBERT BUCHANAN, the poet, has received a verdict of $150 damages against the London Engineer, for alleged libels contained in revisions.

EX-SECRETARY BRISTOW will not go to Europe, as has been reported, but will spend the summer at some Eastern resort, with his family.

CAPT. MACKENZIE and Mr. Alberoni, the two leading chess-players of New York, will play a blindfolded match for the championship.

MURAD V. of Turkey is described as good looking pasty-faced, thirty-six years of age, with a fat nose, a small moustache and a tendency to plumpness.

A SON of old John Brown lives on Jay Cooke's island of Gibralter, in Lake Erie. His hair is the style and color of that seen in the paintings of the Saviour.

A COUSIN of Commodore Vanderbilt is an editor in Rochester. The Commodore has offered him a place as brakeman, but he wants to be a baggage-master.

THE will of Wm. B. Astor has been proved in England, where the personal estate is £400,000, which appears to have been invested in British consols.

A FASHIONABLE but illiterate lady, who was traveling on the continent, in writing to a friend, said that she had just seen the "museum of iniquities" in Genoa.

OLD Gen. Taylor couldn't speak but one Spanish word, and that was *vamos*. He used to make frequent use of it, and the Mexicans used to frequently *vamos*.

BAYARD TAYLOR is writing editorials for the Tribune. His lecture subjects this winter will be "Schiller" and "Ancient Egypt. He will make one Western trip.

A CAMDEN man lugged a butcher-knife around for two hours, offering to kill anyone who said he wasn't Moses, of Biblical fame. Every one said he looked just like Moses.

"MARY," said a mother to her little girl, "if I was a little girl like you, I should pick up all those chips." "Well, mamma," answered Mary, "ain't you glad you are not a little girl?"

RURAL hospitality in Spain is highly spoken of. A stranger can't take lodgings at any country inn, they say, without a certainty of being immediately waited upon by any number of big bugs.

"ISN'T that a beautiful piece of music?" said one of Mrs. Clogger's female boarders, as she turned from the piano. "I like it very much," replied Jones; "particularly those long rests that occur through it."

MISS EMMA CAMERON, a beautiful young lady of twenty summers, will keep house for her father, Secretary of War Cameron, who has taken the house in Washington lately occupied by Attorney-General Pierrepont.

THE cavalry branch of the army of Greece numbers eleven men, nine horses, one old omnibus from New York, and a buck-board for the Colonel. The horses are now being shod, and the cavalry placed on a war footing.

THE Rev. Dr. Armitage, of the Fifth Avenue Baptist Church in New York, prophesied that in 1976 men will be more used to sitting by the side of women in nominating assemblies than they now are to sitting by the side of negroes in Congress.

DOM PEDRO saw a saw saw at the Centennial, the other day, and probably realized that he never saw a saw saw as that saw sawed in all his see-saw existence. It was a circular saw, and, so far as he saw, "sawed" round even faster than he could see himself.

BLIND TOM is making a tour of the Pacific States.

A LONG BRANCH hotel has twelve acres of flowers.

A KENTUCKIAN married the divorced wife of his son.

LAWRENCE BARRETT'S real name is Larry Brannigan.

WILLIAM SHAKESPEARE is laying water-pipe in Boston.

YALE COLLEGE has made Gen. Sherman a Doctor of Laws.

MOST lecturers have stopped talking and gone to fishing.

DOM PEDRO planted a small tree near Washington's tomb.

THE Mikado of Japan has had a gorgeous carriage built in London.

HE was twenty-one years old, she sixty-one, and they were married in Concord.

JOHN B. GOUGH will Blunder 130 times on the platform next winter, at $200 a Blunder.

THE Rev. Dr. Cuyler says that the pulpit is more influential in this country than in any other.

PARADOXICAL—Eleven young ladies have just been made Bachelors of Art at Elmira, New York.

MRS. WOODHULL gives a practical illustration of reform. She has suspended the publication of her paper.

EX-SENATOR SCHURZ and his family are located in Montgomery County, near Philadelphia, for the summer.

WHETHER you work for fame, for love, for money, or for anything else, work with your hands, heart and brain.

Two thousand two hundred dollars per season is what Chicago is willing to pay for a prime base-ball pitcher.

THE Spanish Republican orator, Emilio Castelar, is expected to visit the Centennial Exhibition this summer.

THE £200 a year for the poet laureate of England is reality, but the "pipe of sherry" was done away with in Southey's time.

Two girls were carrying between them a pail of milk, in Carsville, Va., when a stroke of lightning killed one and stunned the other.

ANDREW JOHNSON, JR., only living son of the late ex-President Johnson, an editor of the Greenville (Tennessee) Intelligencer, is in feeble health.

COL. D. R. ANTHONY, the Leavenworth editor who was nearly shot to death last year, is making a tour of the Rocky Mountains with his wife.

ONE of Abdul Aziz's $60,000 wives is looking around Constantinople in search of a home with a quiet family where plain sewing will pay her board.

EMPEROR WILLIAM received 41,371 presents from his subjects last year. They included books, charts, works of art, table delicacies and other things.

CHERRIES are ripe enough now to tempt the robins, and the robins are ripe enough to tempt the cats, and there's a lively time in gardens all the while.

MISS JOHNSON is a Georgia singer whose voice "falls upon her hearers like silver spray upon a sea of molten gold dotted with floating diamonds and precious pearls."

A FIJI ISLANDER became so enamored of Mrs. Scott Siddons during her stay in New South Wales that he offered purchase her of her husband for six bunches of bananas.

TALMAGE advances the idea that a watering place is not the spot where one would be apt to experience religion, although there is no place where it is needed more.

A WESTERN paper coarsely calls the Chinese immigration a beat. Regarding him as a vegetable, we should prefer to speak of him as a queue-comer.—*Norwich Bulletin.*

CAPT. COOK, of the Yale crew, says the rowing of his men has been seriously interrupted by college exercises. Professors will please see that this does not occur again.

EDWIN ADAMS has it on his mind to bring home at least twenty-five Australian dogs with him. He concludes that the midnight bark of the American cur lacks Shaksperian softness.

A LOVING British wife's postscript to a letter addressed to her husband in New York: "Dear William, I have perused the police reports and morgue returns every day, hoping to see your name."

SUNSTROKES are not caused by the heat of the sun, is the latest decision of high medical authority. They say that a person can have one while sitting on the veranda with his feet in the air.

THE Rutland (Vermont) Globe objects to having Deacon Jacob Estey, of Brattleboro, for the Republican candidate for Governor, because he writes "God's blessing" with a small "g" and a capital "B."

A MAN never really understands the doctrine of total depravity till he has worn a pair of white pantaloons to a picnic and sat down on a plate of custard pie. An event of this kind will simplify a whole system of theology.

"IN Eastern lands," when the government wants to get rid of a troublesome subject, he is invited to dine with the chief local official, and word is sent to his family that "his dinner did not agree with him," after which he passes into history.

THERE is too much of this centennial reading. When the fact is disclosed that George Washington had a street fight with a political opponent and was knocked down by him just as a common man might have been, it is time to stop searching through the records.—*Louisville Courier Journal.*

Implements and Machinery.

$1,000 Challenge $1,000

Wilbur's Direct Draft Mower is the lightest draft Mower in the world. Will cut more grass than any side draft Mower. Leaves grass in better position to cure. Enables the farmer to make a better quality of hay—is the most economical Mower the farmer can use. The Eureka shows a new *departure*—a new principle. It shows many points of superiority over side-cut machines. We challenge side-cut machine manufacturers to mow 50 acres with us, in competition, on the above points, for $1,000.

ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Trempealeau (Wis.) Republican.*

ANSWERS TO CORRESPONDENTS.

C. Haughton, Minn.—The plant you send for name is *Anemone Nuttaliana.*

Kilmarnock Willow and Mahaleb Seed.—Can you tell me the secret of budding the Kilmarnock Weeping Willow and sprouting imported Mahaleb Cherry seeds? I have been connected with the largest nursery in the West, and during the last 18 years I have known hundreds of dollars and much time to be spent on the above, all of which has resulted in total failure. The only stand I ever saw was about 40 quarts of native Mahaleb seed that I planted three years ago—planted as soon as gathered.—A. D. F., *McLean Co., Ill.*

It is very likely that the cause of your failure to succeed in budding the Kilmarnock Willow was in not obtaining the right kind of stock. The stock used for this purpose by our nurserymen is the Goat Willow (*Salix caprea*), and we think if you get this species and then bud while the sap is flowing freely there will not be much difficulty in making them take. There is no more difficulty in making Mahaleb Cherry Seed grow than the native species or the Mazzards and Morellos, provided they are fresh and sound when obtained. But the imported seed is frequently one or two years old when sent out, or it is kept very dry, instead of being mixed with some material to keep it moist. There is no reason why the imported seed should not be as good and germinate as freely as that raised in this country, still we know from experience that much of it is worthless when received, through carelessness in preserving.

Haines.—Your statements are altogether too general and too sweeping to be either credited or received as *exact* truth. For instance, you say that the Colorado *bugs* (we suppose you mean beetles) "are here in great numbers, destroying all the *trees.*" Now, you cannot mean that the genuine Colorado potato beetles (*Doryphora 10-lineata*) are eating up the leaves or in any way injuring forest or orchard trees. Have you not made a mistake? Then again, you say, "Nothing would destroy them (the beetles) but the sparrow," and that this bird "is such a great feeder it destroys all worms, bugs and millers." Now, this is rather strong language, crediting the sparrow with good deeds which we do not think he ever performed. When you find any species of the sparrow, native or foreign, eating and destroying potato beetles and "all kinds of worms," we hope you will call in a number of witnesses and have the thing settled beyond dispute. Sparrows do eat some kinds of insects, but not all, nor one-tenth of all, of our commonest species.

Naturalist.—The minute worm found in pork and known as *Trichina spiralis* was discovered and named by Prof. R. OWEN, the celebrated naturalist of the British Museum, some forty odd years ago, and therefore it is not, as you suppose, a discovery of recent date. The name of the genus, *Trichina*, is from the Greek, and means thrice hairy, or made of hair, and the specific name, *Spiralis*, was fastened upon this worm by Prof. OWEN, probably, because the first specimen he examined was rolled up in a spiral form.

Cedar Apples.—Will you allow a subscriber's wife to ask a question in regard to the excrescences or balls that appear on cedar trees? You perhaps know to what I allude—a hard, knotty, green-looking protuberence that, in wet weather, shoots out a red, jelly-like substance. I have been told they will destroy the cedars. I have a hedge of large trees covered with these balls. Do you think they will kill the trees? What produces them and what are they called? Please answer and you will much oblige—S. A. B., *Sumter Co., Ala.*

A number of years ago, Dr. FITCH, in his entomological reports to the N. Y. State Agricultural Society, stated that these cedar apples were galls produced by some species of gall flies. But the late BENJAMIN WALSH, in the second volume of the "Practical Entomologist," informs us that they are not caused by insects, but are in reality "Epiphytous Funguses," or a kind of mushroom, like many of the lichens and mosses found on the stems and branches of trees. These cedar apples commence their growth early in the season and come to maturity soon after the weather gets warm in spring. At this time, says Mr. WALSH, and for more than a month afterward they are white and fleshy inside, whereas the old last year's specimens which still hang on the trees are rust-red inside and of a hard, dry, spongy texture. After a few warm, moist days in the early part of summer, the new cedar apples put forth from their surface many filaments, about one-fourth of an inch long, bearing upon their surface a quantity of rust-red powder which consists of "spores," or seeds of the fungus. These fungoid excrescences are sometimes so very abundant that they check the growth of the trees. But to get rid of this pest it is only necessary to cut off all that are found from year to year, before they mature, and scatter the "spores," which answer the place of seeds in the higher order, or what are termed flowering plants.

Coleus—Shah and Lady Burrill.—I see by the RURAL of July 1 that a correspondent wishes to know the reason of his "Shah" Coleus not growing variegated, as he expected. Last year I procured the "Shah" of two different florists, and they were both very inferior and not worth growing. I then procured the "Lady Burrill," and the plants were properly marked even when small. Hence I believe there is a difference between the "Shah" and the "Lady Burrill," and that your correspondent received the former from some florist, who, not having the true variety, sent out what he had.—A FLORIST.

T. T. objects to the appearance of whitewashed trees and asks how it can be colored? Use lamp-black or soot. With these a dull color may be made so nearly that of bark that the stems do not show they have been whitewashed.

T. R. J., Rockville, N. Y.—"I am building a new house and laying out my grounds. I prefer to plant my evergreens, raspberries, blackberries, currants and fruit trees this fall. I have had no experience in planting, and have asked many friends whether fall or spring is best. Some say one, some the other. Will you advise me? Also, if not asking too much, please give names of the best plants named above."

Ans. There is no question that has been harped upon more than that of whether to plant in spring or fall—and needlessly, as we think, since it is one which climate determines. In the South, fall—in the North, spring is the best time. In the latitude of New York, as you say, some prefer one, some the other, and this, whether advisable or not, depends upon exposure, since New York may be considered the extreme northern limit for fall planting. We should never choose fall for transplanting evergreens. Raspberries and blackberries, if transplanted in the fall, should be well covered with litter.

For evergreens, we name Hemlock and Norway Spruce, Balsam Fir, Siberian Arborvitæ. Apples—Baldwin, Tompkins Co. King, Early Harvest, Fall Pippin, Rhode Island Greening, Roxbury Russet. Pears—Bartlett, Seckel, Duchesse d'Angouleme, Clapp's Favorite, Winter Nelis, Lawrence. Raspberries—Franconia, Herstine, Davison's Thornless, Philadelphia. Blackberries—Kittatinny, Lawton. Currants—Cherry, Red Dutch, White Grape.

E. Ritter says:—"A good deal has been said in the RURAL against sprinkling plants during dry periods. The drought with us is terrible—Do you say I must not water bedding plants? Wherein does sprinkling from a watering pot differ from a shower?

Ans.—It differs in being confined to a small space—in forming puddles the weight of which presses upon the soil washing the finer particles between the coarser ones and creating a close muddy bottom that at once stiffens under the sun's rays. When once this fine powdery surface has been formed, subsequent waterings penetrate less readily—the air is excluded from the roots—the earth is made a better conductor of heat and becomes hot enough to scald the fibrous roots and the plant suffers accordingly.

When the earth is dried out as yours is, it requires a surprising quantity of water to reach the roots. And even then the parched earth surrounding the plant that is watered very soon absorbs it, so that the watering amounts to only a temporary stimulant, which, when thus rapidly withdrawn, leaves the plant less vigorous than before. It is often recommended to remove the surface earth, fill the hollow with water, and then replace the earth loosely. Even this plan is with many plants injurious. We have thus killed young Magnolias in a day or so, though other newly transplanted subjects have been benefited. We ask Mr. RITTER to try for himself the experiment. Take two Balsams or Pelargoniums—water one, leave the other to the drouth, and mark the results.

Neophyte.—Will you kindly inform me through your "Answers to Correspondents," what is the matter with my Madeira Vines? The leaves are constantly filling with holes without, so far as I can see, apparent cause.

Madeira Vines will stand a deal of dryness but are impatient of much moisture. If your vine is in a pot, examine the drainage and see that it is ample and then let it dry out for a day or so. Keep the earth afterwards barely moist. We have seen Madeira Vines thriving in rockeries while many other plants were drooping for want of rain.

C., N. J.—"Will you please tell through the R. N. Y. what is the matter with these grapes?" ANS.—In seasons of drouth this often occurs, viz.: the protrusion of the seed beyond the skin. It would seem that the seeds develop at the expense of the pulp and finally burst through the skin, which cannot proportionately expand for want of sap.

G. B.—You can rid your grounds of Purslane by pulling it up by the roots. A single leaf or particle of stem will take root, so that, whenever broken or cut in two, two plants will take the place of one.

Real Estate.

WELL-IMPROVED FARM
IN NEBRASKA FOR SALE.

Thirty miles north of the Kansas and Nebraska State line, within one mile of the Missouri River, the same distance from the county seat of one of the best counties in the State, the present terminus of an operating railroad. Traveler's Guide.

JOHN CRUMP, - - Proprietor,
Chestnut St., cor. 15th,
PHILADELPHIA.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York,
9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.
7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars.

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Agents Wanted.

DIAMONIZED Metal Knife and Scissors Sharpener, Glass Cutter and Ice Pick in one. "Best in the world." "Wouldn't sell it for $5." "Is worth a dozen steels." Hundreds of similar testimonials! Samples by mail, 25 cents. Terms to Agents of this and other Novelties, free. G. J. CAPEWELL MANF'G CO., CHESHIRE, CONN.

$5 to $20 per day at home. Samples worth $1 free. STINSON & Co., Portland, Me.

CHARLES DUDLEY WARNER AMONG THE **MUMMIES** AGENTS
How he Journeyed into the Land of Egypt. Richest thing out. New faces on old things. wanted in every Town. For Circulars and Terms, Address AMERICAN PUBLISHING CO., Hartford, Ct., Chicago, Ill., Cin. Ohio.

$40 AGENTS' PROFITS A WEEK.—New Novelties and Chromos. Catalogues free. GEO. L. FRIXON & Co., N. Y. C.

AGENTS WANTED for the fastest selling book ever published. Send for circulars and our extra terms to Agents. NATIONAL PUBLISHING CO., Philadelphia, Pa.

WANTED Agents for the best-selling Stationery Packages in the world. It contains 15 sheets paper, 15 envelopes, Golden Pen, Pen-holder, Pencil, Patent Yard Measure, and a piece of jewelry. Single package, with a pair of elegant gold stone Sleeve Buttons post-paid, 25 cts; 5 packages, with assorted jewelry for $1. Watches given away to all agents. Circulars free. BRIDE & CO., 763 Broadway, New York.

$12 a day at home. Agents wanted. Outfit and terms free. TRUE & CO., Augusta, Maine.

AGENTS WANTED TO OBTAIN Subscribers for the best Agricultural and Family Weekly Newspaper. Liberal commissions for little work. Address RURAL PUBLISHING COMPANY, Box 3318. 78 Duane St., New York City.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

Wit and Humor.

SPARKS AND SPLINTERS.

A HASTY man never wants woe.

THERE is nothing half so sad in life as the spectacle of an auctioneer attempting to sell $15,000 worth of goods to an audience whose aggregate and tangible assets foot up thirty cents.

AT a restaurant, the other day, a man inquired, reading from a bill of fare. "What is this sirloin of beef a la financiere?" "I suppose that is cut from the stock exchange bull," replied his friend.

"A SETTLER"—Hairdresser—'Air's rather thin on the top, sir. We can 'ighly rec— Customer (gayly)—Yes. Can you recommend any stuff which will—ah—remove the r'mainder? (Operator tacet.)

WHY should the beehive be taken as a symbol of industry? Not a bee is to be seen all winter long, while the cockroach is up at 5 o'clock in the morning and never goes to bed till midnight. Let's change this thing.

"WELL, you know, Bobby, your eye's very inflamed; you can't go out with Tommy Brown till that speck of dust's out of it!" Bobby (anxious to be off)—"I'm all right—I know it's out now; (earnestly) I—I think I heard it fall!"

THE original Ulster overcoat was invented at Valley Forge. It consisted of a bed blanket, with holes to put the arms through, and a mule's halter for a belt. Washington's was a manly form, and he never looked so inspiring as when he wore this ample garment.

IT is a delicious sight to see a Milwaukee man toying with the lobe of his sweetheart's ear—so white, so soft, so different from an elephant's. Delicious, likewise, to watch him wrap it two or three times around his neck, and pressing his chin lovingly upon it, hear him murmur those magic words, "Yum! yum!"

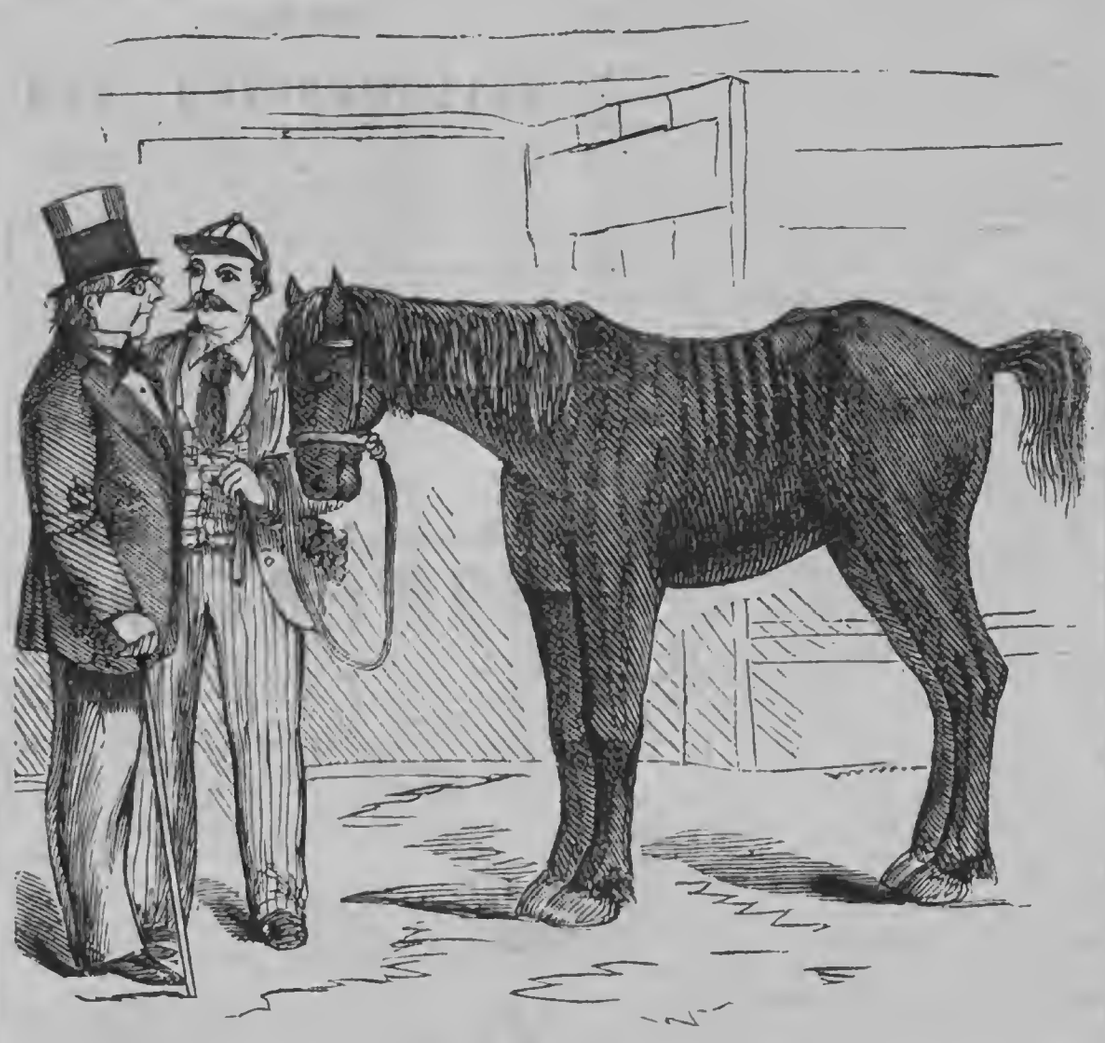
"ARE you going to make a flower-bed here, Judkins?" asked a young lady of the gardener. "Yes, miss, them's the orders," answered the gardener. "Why it will quite spoil our croquet ground." "Can't help it, miss, them's your pa's orders. He says he'll have it layed out for horticulture, not for husbandry!"

ON board the Cunard steamers the church service is read every Sunday morning. The muster-roll of the crew is called over, and they attend service. A gentleman one day said to one of the sailors, "Are you obliged to attend public worship?" "Not exactly obliged, sir," replied Jack, "we should lose our grog if we didn't."

A NEW almanac contains the following valuable chronological points:

Mo. | 12 | Mr. Wilkins died 1834. His wife wore half mourning. Moon in ☞ * ¶ |.
Tu. | 13 | Very low tide—shoes. Sun in apoplexy. Five million years ago to-day base ball was invented.
W. | 14 | The Bostons will play another club. Expect hot weather about now.

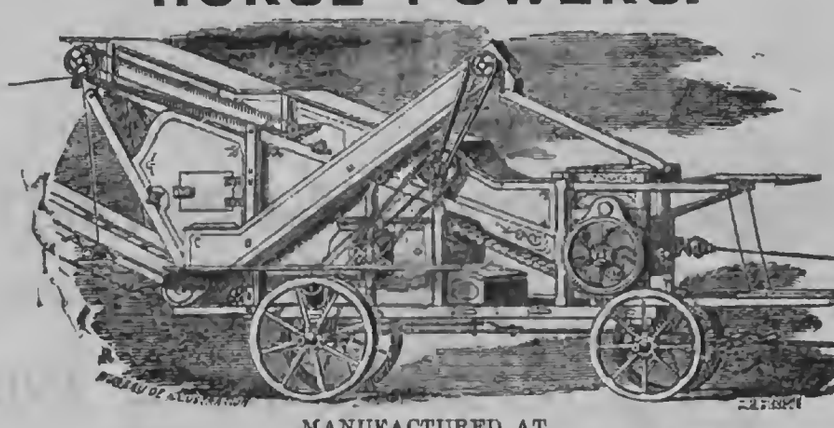
"EVERY man," said Mark Lemon one evening at his club, "has his peculiarities, though I think I am as free from them as most men, at any rate I don't know what they are!" Nobody contradicts the editor of Punch, but after a while Albert Smith asked:—"Which hand do you shave with, uncle?" "With my right hand," replied Lemon. "Ah," returned the other, "that's your peculiarity; most people shave with a razor."



VERY LIKELY.

Jockey to Doubtful Buyer.—"You may not be abble to see his points! But I tell oon he's got lots of em! You'd go a long ways before you'd find another hoss like him."

The Buffalo Pitts Threshers
AND
HORSE POWERS.



MANUFACTURED AT

The Pitts Agricultural Works, Buffalo, N. Y.,

Have been known throughout the United States for over thirty years as the

MOST PERFECT AND LIGHTEST-RUNNING THRESHERS

in the World.

FOR THE HARVEST OF 1876

I am offering a large assortment of these Celebrated and Popular Machines, adapted to either Steam, Water or Horse Power.

They combine all the latest improvements which are to be found in other threshers, and some which are found in the Buffalo Pitts alone.

They are built under the direct supervision of PRACTICAL THRESHERMEN (who have followed threshing as a business), and all changes made are the suggestions of experience in the field, and are thoroughly tested there before adoption.

Threshers will appreciate the great advantage of this over

Theoretical Threshing Machine Building.

The greatest care is given to using the very *best material* and to having the work done in the *most thorough* manner.

My facilities for purchasing materials at lowest figures and for economical building are surpassed by none and the machines are offered at the lowest prices at which

The Best Material, put up in the Best Manner, can be Afforded.

In comparing prices Threshers will please note differences in material, workmanship and finish and bear in mind that

The Best is the Cheapest in the end, even though the first cost is greater.

Various sizes are made:—24-in., 28-in., 32-in., and 36-in. Cylinder Threshers and 4-horse, 8-horse, 10-horse and 12-Horse Powers.

Repairs are for sale in almost every county in the wheat-growing country, *at my list price.* For Catalogues, Prices, &c., &c., address

JAMES BRAYLEY, Buffalo, N. Y.,
or 44 South Canal St., Chicago, Ill.

USE ONLY THE BEST.
THE RUBBER PAINT
IS THE
BEST PAINT IN THE WORLD.

RUBBER PAINT MANUFACTURED BY THE RUBBER PAINT CO. CLEVELAND, O.

There is no Paint manufactured that will resist water equal to it. It is Smooth, Glossy, Durable, Elastic, Beautiful and Economical; and of any shade from PURE WHITE to JET BLACK; and as evidence of its being the *BEST PAINT* the necessity of their establishing the following Branch Factories will abundantly testify.

BRANCH FACTORIES:

506 West St., New York. 83 West Van Buren St., Chicago, Ill.
210 S. Third St., St. Louis, Mo.; and a Wholesale Depot at Wm. King & Bro., No. 2 North Liberty St., Baltimore, Md.

Sample Card and numerous Testimonials sent FREE on application.

ARE YOU GOING TO PAINT?
USE NONE BUT THE
Averill Chemical Paint.
It is the Original and Only Reliable Mixed Paint, Mixed Ready for Use.

It is the most *Durable*, the *Handsomest* and most economical paint made. Send for sample card, with testimonials from owners of the finest residences in the country. For sale in every section of the country.
AVERILL CHEMICAL PAINT CO., 32 Burling Slip, N. Y. City.

SEND FOR CIRCULAR of Agricultural Implements to ABBOTT, BREW & CO., Mfr's, Cleveland, O.

SEND TO JAMES BRAYLEY, BUFFALO, N. Y., for Descriptive Price List of Buffalo Pitts Threshers and Horse Powers.

"THE VIBRATOR."
1,000 SOLD LAST SEASON
WITHOUT ONE FAILURE OR REJECTION.

This is the famous Threshing machine that has "swept the field" and created such a revolution in the trade, by its MATCHLESS GRAIN-SAVING AND TIME-SAVING principles.

THE ENORMOUS WASTAGE of grain, so *inevitable with other styles* of Threshers, can be SAVED by this Improved Machine, *sufficient, on every job, to more than pay all expenses* of threshing.

FLAX, TIMOTHY, MILLET, HUNGARIAN and like seeds, are threshed, separated, cleaned and saved, as easily and perfectly as Wheat, Oats, Rye or Barley.

AN EXTRA PRICE is usually paid for grain and seeds cleaned by this machine, for extra cleanliness.

IN THE WET GRAIN of 1875 these were substantially the ONLY MACHINES that could run with profit or economy, doing fast, thorough and perfect work, *when others utterly failed.*

All GRAIN, TIME and MONEY wasting complications, such as "Endless Aprons," "Raddles," "Beaters," "Pickers," etc., are *entirely dispensed with*; less than one-half the usual Gears, Belts, Boxes and Journals; easier managed; more durable; light running; no costly repairs; no dust; no "litterings" to clean up; not troubled by adverse winds, rain or storms.

FARMERS and GRAIN RAISERS who are *posted* in the large saving made by it, will not employ inferior and wasteful machines, but will *insist* on this improved Thresher doing their work.

FOUR SIZES made for 6, 8, 10 and 12 Horse Powers. Also a specialty of SEPARATORS designed and made EXPRESSLY FOR STEAM POWER.

TWO STYLES OF HORSE POWERS, viz.: our improved "Triple Gear," and our "Spur Speed," (Woodbury Style), both "Mounted" on *four* wheels.

IF INTERESTED in Threshing or Grain Raising, apply to our nearest Dealer, or write to us for Illustrated Circular (sent free) giving full particulars of Sizes, Styles, Prices, Terms, etc.

Nichols, Shepard & Co.,

(CIRCULAR.)

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

WILD SCENERY OF THE FAR WEST.

THE Far West—now termed the Rocky Mountains and Pacific Slope—is a region of country of which we know very little a quarter of a century ago. But the discovery of the rich mineral treasures buried therein has attracted thousands to explore this hitherto almost unknown land, these again being followed by greater numbers of curiosity-hunters and pleasure-seekers. There is probably no region of country of the same extent which furnishes such an abundance of materials worthy of investigation, or that is richer in natural scenery than the ranges of mountains beginning in Colorado and Wyoming and extending westward to California.

It may be a little more fashionable to visit Europe and explore the Alps than it is to cross the Plains and view our own grand mountains, with their stupendous peaks, covered with perpetual snow, or deep canons, extensive parks, beautiful water-falls and crystal lakes, but we maintain that for grandeur of scenery and all that goes to make a country worth seeing, whether for health or pleasure, this continent cannot be surpassed. Of course it is not every one whose circumstances will permit them to visit those (of late) much-admired and frequented regions, still those who are compelled to stay at home can now get a glimpse of the Great West through the many excellent sketches of our artists, and perhaps none are presented in a more convenient form, or are more truthful than those given in the "Pacific Tourist and Guide," by H. T. WILLIAMS, to whom we are indebted for the accompanying view of Lake Tahoe.

This beautiful sheet of fresh water is 22 miles long and 10 wide, on an average, and about three-fourths of it lies in California and one-fourth in Nevada. It has an elevation above the sea of a mile and a quarter and has been sounded to the depth of 1,645 feet. Through glacial action in past ages, ice must have been piled to the hight of 3,400 feet in the valley of this lake. The water in Lake Tahoe never freezes and is generally as smooth as glass and clear as crystal, permitting trout to be seen and pebbles counted at a depth of 50 feet. Its water changes color to a beautiful emerald or indigo blue, according to the depth, and when disturbed by the fierce mountain winds, its waves lash the shore with foaming fury. A neat little steamer, capable of accommodating 200 passengers, is provided to take tourists around the lake.

Glenbrook is the name of the village which is the business center of this region, and the accommodations for tourists are ample and excellent.

It is the business center of the whole region that borders the lake. There are two hotels, the Glenbrook and Lake House, with excellent accommodations at very reasonable rates. The name Tahoe, given to the lake, signifies in the Indian language "Big-Water," the same as applied to the ocean. There are many points of interest in the vicinity, notably Shakespeare Rock and Cave Rock. The only drive of any note in the neighborhood is from Tahoe City to Sugar Point—the cost of making roads in that region being in most instances enormous.

Those of our readers seeking pleasure in travel should not omit a journey to this lake of the mountains, situated as it is among some of the grandest scenery on this continent.

LAKE TAHOE, IN CALIFORNIA AND NEVADA.

Industrial Topics.

FRENCH SILK-WORMS ON THE OSAGE ORANGE.

ALTHOUGH an enterprise both feasible and promising, sericulture has, up to the present time, met with but little encouragement in the United States. With the exception of what is known as "the *Morers Multicandis* fever" of forty years ago, and the equally profitless Californian excitement of more recent date, the subject has never received any general attention, and as a national industry has never been fairly tested.

Among the obstacles in the way of rearing the silk-worm is the delay necessary to grow the species of Mulberry upon which it feeds. I have thought, therefore, that were it generally known that the Osage Orange—of which almost every Western farm boasts its hedge—is almost, if not quite, equal to the Mulberry as silk-worm food, this neglected industry might receive a fresh impulse and our American silk factories be able in time to obtain their supplies of raw silk at home, instead of importing, as at present, from France and Italy.

The discovery that the worms will feed upon the Osage Orange (*Maclura aurantiaca*) is no new thing. It was made many years ago in France, but as there was at that time and in that country no advantage to be gained by the substitution of the Osage Orange for the Mulberry, but little importance was attached to the experiment.

A few years since Mr. SAMUEL GLOVER of the U. S. Department of Agriculture and a Mr. SAMUEL CORNARY of Utah published accounts of the successful rearing of silkworms on the Osage Orange. These experiments attracted the attention of our State Entomologist, Prof. RILEY, who, the following spring, procured eggs from Utah, and, assisted by the writer, reared a large number of the worms upon the new kind of food.

The worms experimented with proved, however, to be of the Syrian race, which are extremely hardy, but whose cocoons, though of a beautiful gloss and strong fiber, are nevertheless valueless for reeling, on account of their loose and flossy texture. It still remained to be seen whether the French and Chinese varieties would thrive upon the unaccustomed food. Accordingly, at the suggestion of Prof. RILEY, I began, in the spring of 1872, a series of experiments with the best French and Japanese varieties, with the view of testing the matter thoroughly.

The worms hatched about the middle of April and were placed at once upon the opening buds of the Osage Orange, which they ate with avidity. They continued to thrive until the third molt, when symptoms of Pebrine, or Silk-Worm Cholera, which has been such a scourge in Europe, manifested itself among the French varieties. The disease soon became so malignant that by the time the worms were ready to spin nine-tenths or more had perished. Pebrine is contagious, and was soon communicated to the Japanese worms, and they, together with a few of the Syrian variety that were kept in the same room, died in great numbers. A few cocoons, however, of each variety were obtained. These were large and firm and in no wise inferior to those of Mulberry-fed worms. The moths were allowed to issue and gave a plentiful supply of eggs, which were placed in a cool, dry cellar for preservation.

In the spring of '73 the worms hatched several days later than those of the previous year, but the season being unusually cold and backward, their growth was retarded by a scant supply of food for the first ten days. The disease did not attack them until about the time of the last molt, and by carefully separating the infected from the healthy, upon the first appearance of sickness but few fell victims. The cocoons were of good quality, though not so large as those of the preceding year.

Since that time I have regularly raised a small number of the worms every spring, and not a trace of their peculiar disease has manifested itself. The worms have been uniformly healthy and hardy, and have produced good cocoons, those of the French and Japanese White Annuals being firmest and strongest.

These experiments certainly prove the entire practicability of rearing the finest varieties of silk-worms upon the Osage Orange—a discovery of importance, not only to the future silk-growers of this country, but possibly to those of Europe, where the decadence of the Mulberry is already causing some anxiety. They would also seem to indicate that a change to the new food plant is a remedy for the dreaded disease which has during some years threatened the entire silk crop of Europe. Whether a change of food simply would effect a cure, or whether, in the case of my worms, climatic influences operated largely in their favor remains, of course, to be proven.

An experiment in the production and manufacture of silk which is now in progress in Kansas is worthy of general interest. About eight years ago Mr. E. V. BOISSIERE, a French capitalist, came to this country with a colony of his people and established himself in Franklin Co., Kan., laying the foundations of the town of Silkville. Here he erected a factory for the manufacture of velvet and other ribbons, procuring his supplies of silk from his native land, but designing eventually to produce them at Silkville. To this end he set out at once over ten thousand trees of the White Mulberry, which have made rapid growth and are already capable of feeding a vast number of worms.

I have just learned that Mr. BOISSIERE has returned from a recent visit to his native land, bringing with him the apparatus for reeling silk from the cocoons, the first, I believe, that was ever introduced into this country. Prof. RILEY has desired him to carefully test the merits of the silk produced from Osage Orange. Should it compare well with that produced from Mulberry, a new and important industry will be opened without delay to those who have upon their farms hedges of Osage Orange.

The labor involved in the production of cocoons is but slight, and may easily be performed by young children and delicate women, and would not, therefore, interefere with the duties of ordinary farm laborers.

The worms begin to spin in about a month from the date of hatching, and in six weeks all duties connected with them for the year would have been performed. The worms require but slight protection from the weather. Indeed, I believe in this climate (Central Missouri), were it not for the birds, they might be scattered over our hedges and left to shift for themselves, and the cocoons in due time be gathered like fruit from among the branches. I have several times tried them in this way, and they thrived remarkably, in spite of gales and frequent showers, as long as the birds permitted them to live; but as they approached maturity, their white color rendered them so conspicuous that none survived long enough to spin. MARY E. WURTFELDT.

Kirkwood, Mo.

HOW TO PAY DEBTS WITHOUT MONEY.

IN many portions of the country the cry of "hard times" and scarcity of money is raised, and although it is frequently asserted that there is plenty of money to purchase all commodities offered for sale, yet practical experience demonstrates the fact that a great many needful and useful articles will not command ready money, except at great sacrifice in price. This is especially true of all kinds of mechanical articles, as well as some kinds of farm produce. One great pressure of the times is for money to liquidate present liabilities, and whatever might be said against going into or being in debt the fact is there is a vast amount of local or neighborhood indebtedness throughout the country, and it often causes considerable hard feelings as well as litigation when, after running a long time, it remains of necessity unsettled.

There is a way that considerable neighborhood indebtedness might be canceled, by concert of action through a Grange, or local organization of some kind, by exchange of claims and commodities. There should be a Secretary to keep account of debts and credits of the members and effect the exchange. It might be somewhat on this principle: Suppose A owed B and B owed C and C owed D and D owed A; in this case, if the amounts were equal all round, the whole line of debts might be canceled without the use of any money. But if A, being a family man, owed C, who was a shoemake, and C owed B, who was a merchant, and B owed D, who was a farmer, and D did not owe A anything, but wanted a plow, an exchange might be effected to the mutual satisfaction and relief of all parties without the exercise of any money. The above diagram shows how an account might be stated and kept by the Secretary, which might be enlarged to accomodate all parties to the organization. It shows at a glance a summary of debits and credits as they exist among the members. The perpendicular names being Dr. and the horizontal Cr., the square where the names meet showing the amount of the debt in dollars. B. W.

Angola, Ind.

Entomological.

IS THE COLORADO POTATO BEETLE POISONOUS?

ALMOST every insect when it first appears in more than usual numbers in a locality is accredited with possessing either beneficial or noxious properties. The Colorado beetle has not escaped this notoriety and many cases of supposed poisoning have been reported as the consequence of handling or killing this insect. Prof. RILEY in his eighth annual report gives some of the results of investigations in this direction from which we extract the following:

To investigate the matter, a quantity of the bugs collected from fields near Buffalo, where no arsenic had been used, was submitted to distillation with salt water, so as to allow of an increased temperature. Under this process, about four ounces of liquid were procured from one quart of the insects. This liquid was perfectly clear and emitted a highly offensive smell; it proved of alkaline reaction on account of the presence of a certain quantity of free ammonia and carbonate of ammonia.

Again, an equal quantity of the bugs was used to prepare a tincture made as follows: Absolute and chemically pure alcohol was condensed upon the live bugs; after a digestion of twenty-four hours the alcohol was evaporated at a gentle heat. The tincture so obtained had a decidedly acid reaction, was brown in color and was not disagreeable in smell.

To ascertain the effect on the animal system of the liquid and the tincture above described, a number of frogs were procured for the experiment. About one-half cubic centimeter of the liquid and the tincture each was introduced separately into the stomach. Neither the liquid nor the tincture produced any apparent effects. The vivacity of the frogs so treated continued unimpaired, notwithstanding the complete retention of the doses.

Again, two fresh frogs were submitted to a hypodermic injection of the liquid and the tincture, in the hind legs, by means of an ordinary hypodermic syringe. The injection of the distilled liquid was unattended by injurious results. A slight disinclination, at first, to use the hind limbs was shown also in the case of another frog, which was treated hypodermically with pure water, to check the results obtained.

The injection of the tincture, however, proved fatal to the subject. A few moments after the operation, the leg operated upon seemed to become paralyzed, and the heart stopped beating within thirty minutes afterwards, by which time the other two hypodermically treated, seemed to have completely overcome the effects of the operation.

The tincture, though highly concentrated, contained but a small quantity of animal acids. * * * The acids being found to be present in such small quantity, the conclusion is unavoidable, in the light of the present experiments, that the bugs are not poisonous.

The experimenters conclude that the reported cases of poisoning result rather from the arsenic used in destroying the insects, or from carbonous oxyd produced by incomplete combustion, when large amounts of the beetles are thrown into a fire. It is to be hoped that the experiments will be continued, 1st, because they by no means cover the whole ground: 2d, because, so far, they admit of the opposite conclusion to which the experimenters arrived. Until we have learned what the active principle is which produces the physiological effect that has been well attested, and the precise conditions under which it acts, the experience recorded in my last report will go for more than such experiments. The active principle, as there stated, is most probably volatile, and the processes described in the above experiments very probably had the effect to liberate the poison. Boiling is well known to destroy many organic poisons in this manner, or by decomposition, and the green tuber, the fruit and haulm of the common potato, lose their poisonous qualities by being so treated. In obtaining tinctures, whether by percolation of the powdered material or as described in the experiments, the poisonous principle may, further, not be extracted; it may be coagulated by or insoluble in the alcohol, and it is quite essential that we know the nature of the vessel employed.

In conclusion, the physiological effects of a poison may differ vastly as between cold and warm-blooded animals; the tincture is admitted to have contained an acid (which may be the poisonous principle) and to have killed a frog; and the possible injurious effect of the fumes from burning the insects granted. I therefore find no reason to change the views expressed a year ago, and it is worthy of note that Prof. A. J. Cook of the Michigan Agricultural College, from experiments somewhat similar to those of Messrs. Grote and Kayser, has arrived at opposite conclusions to those which these gentlemen came to.

THE CODLING MOTH.

THAT the depredations of the progeny of this insect have become the most serious obstacle to the raising of fruit in general seems now universally admitted, and the question, "What shall be done in the way of remedy?" is frequently asked, and the various plans of defence are being discussed with a seriousness that augur success should the remedies proposed only become generally adopted.

An understanding of the habits of breeding, transforming and hibernating is essential to success in the destruction or prevention of any insect. In this the entomologists teach us much that is valuable, but in their eagerness to give them their true names in a foreign tongue, trace their origin, and give their true order and class, they are apt to overlook the part most important to the sufferer by their depredations: the means to head them off or destroy them. The means for the latter purpose that have been most successful thus far have been the providing of artificial hiding-places for the larvæ to occupy while changing to a pupa, in which place they can be easily and rapidly destroyed, and the most successful device has been bands of paper or cloth (woolen cloth is preferable) put around the trunk. The bands can be easily taken off, the worms destroyed, and the bands replaced.

The writer of this article claimed, some two years since, to have discovered or first promulgated a habit of this larva overlooked by the entomologists, which, in addition to the bands mentioned, opened the way for a most complete destruction of this pest. I claimed to have made experiments which proved to my entire satisfaction that this larva having destroyed the vitality of an apple, leaves it during the night and enters another, thus destroying many during its larva life. This fact being admitted, a remedy is readily suggested: to pick off frequently all wormy apples and destroy them. I have, however, never discouraged the use of the bands as an adjunct, for many will escape the picking and complete their larva life.

To record all the opposition this theory has met with, the many experiments made by me and other laymen, all the latter tending to its confirmation, would be foreign to the object of this article, which is to request through the RURAL that those raising apples that are thus injured should make the following experiments: First, take out a half or full-grown worm, place it by the side of a sound apple and cover them from the light; examine next day and see if the worm is not inside. Second, in order to show whether this is not done, as a last resort rather than as a habit, pick off a quantity of wormy apples, say 20 to 50, so as to be sure to get a number that have the worms still in them, put them in a box and let them remain in two or three days, or until they are a little wilted; then put in a few sound apples, mark and count them and cover up for a few days, and then see if the fresh ones are not occupied.

Now is the proper time to make these experiments, as the emigrations become less frequent as the fruit increases in size. Reports through this paper will reach me. I shall be happy to respond at any time to any questions asked, and at another time may give a complete history of the experiments of myself and others in this matter. S. B. PECK.

Muskegan, Mich., July 7, 1876.

The Herdsman.

INTERNATIONAL EXHIBITION OF LIVE STOCK.

ORGANIZATION AND DUTIES OF THE JUDGES.

I. AWARDS shall be based on written reports, attested by the signatures of their authors.

II. Reports will be based upon inherent and comparative merit, the elements of merit being specifically mentioned.

III. The Judges assigned to each Group will choose from among themselves a Chairman and a Secretary. They must keep regular minutes of their proceedings. Reports recommending awards shall be made and signed by a Judge in each Group, stating the grounds of the proposed award, and such reports shall be accepted, and the acceptance signed by a majority of the Judges in such Group.

IV. The reports of the Judges recommending awards, must be returned to the Chief of the Bureau of Awards not later than ten days after the close of the Exhibition, in each Group.

V. Awards will be finally decreed by the United States Centennial Commission, in compliance with the Act of Congress of June 1, 1872, and will consist of a special report of the Judges on the subject of the award, together with a Diploma, and a uniform Bronze Medal.

VI. In addition to reports on the merits of individual exhibits, the Judges of each Group will be expected to render a report general in its nature, summarizing the Exhibition in their Group, and indicating the recent progress noted in breeding, rearing or training.

VII. Vacancies in the corps of Judges will be filled by the authority which made the original apointment. No Exhibitor can be a Judge in the Group in which he is a competitor.

VIII. The Chief of the Bureau of Awards will be the representative of the United States Centennial Commission in its relations to the Judges; upon request he will decide all questions which may arise during their proceedings in regard to the interpretation and application of the rules adopted by the Commission relating to Awards, subject to an appeal to the Commission.

A. T. GOSHORN, Director-General.

FRANCIS A. WALKER, Chief Bureau of Awards.

FEEDING AYRSHIRES.

MR. C. C. HOLTON, Rochester, lately read a paper on Ayrshire cattle before the Western New York Farmers' Club, in the course of which he said:—I find by repeated experiments, that my cows, while in milk, require about 21 pounds of hay or its equivalent, per day, with the addition of 5 pounds of sugar beets or the same of potatoes. The only carefully conducted experiment which I have made, bearing upon the subject of profit, was with the cow, Daisy, weight 900 pounds, in which from March 15th she gave 4,322 pounds of milk in 26 weeks, which being made into butter gave 257 pounds, and was sold at 35 cents (or $86.40), 5 per cent. of milk being butter. I recently purchased four grade Durham cows, in the fall, not larger than my largest Ayrshire, and commenced with the same feed, viz:—21 pounds per day, which I found necessary to increase to 33 pounds, which proved to be the quantity required. Two and a quarter tons more in the year would be consumed by the grade than by the Ayrshire. My present stock bull, whose weight is 1,500, is fed the same rations as my cows in milk, viz:—21 pounds of hay and 5 pounds boiled beans.

The Apiarian.

MISCHIEVOUS STATEMENTS EXPOSED.

ENGLISH apiarians frequently have cause to complain of the boasting of their cousins on this side of the Atlantic, and we are always ready to help them when they have the truth for a basis. In fact we had a little rather have our English friends point out our faults than virtues, because in the former we may have a chance to learn something and it keeps us from becoming egotistical. A correspondent of the London Journal of Horticulture thinks some of our American bee-keepers are inclined to brag a little, and perhaps exaggerate somewhat when making statements in regard to the profits of bee-keeping, and in this we agree with him, and hope he will keep knocking at these inflationists, or, a less elegant phrase, gas-bags, until they learn to talk reasonably, a part of the time at least. But we will let him tell his own story:

"If the statement of some American bee-keepers, which 'B. & W.' quoted in last week's Journal, be facts, and not fancies, the question of hives is comparatively a very important one. If the statements referred to represent facts, our bees are lazy, useless creatures, comparatively speaking. In 1863 Mrs. Tupper had two Italian stocks which yielded 200 pounds of honey, while fifty-six stocks of common bees did not yield an ounce. At a convention of American bee-keepers in 1866, it was unanimously admitted that the Ligurians are superior to common bees. After making these statements, 'B. & W.' favors us with the opinions of the editor of the 'American Text-Book of Bees' as to the superiority of Ligurians. They possess greater individual strength, fly with less fatigue, work when other bees are idle, suck honey from flowers which others do not visit, work more steadily during the season, breed earlier in spring and later in Autumn, cast off earlier and larger swarms, live longer than common bees, are always so busy that they have no time or inclination for robbing, and they dethrone their queens and prepare successors before old age overtakes them. Hence Italians are seldom queenless. They are more peaceful, graceful, beautiful, attracting many visitors.

"Does anybody in England believe this American trumpery? I do not think that it would be possible to find a respectable person in either England or America that would indorse the mischievously extravagant statements of this American editor. Even 'B. & W.,' who has quoted them, says that he has overdone it by claiming too many good points, and the wish has been father to the thought. Some ten years ago we had one or two quack dealers in England, who said as many extravagant things about Ligurians as this editor. Things have changed a little, and we are not now favored publicly with a list of their excellences. And even in America, in a convention of bee-keepers, held some years after 1866, the year referred to by 'B. & W.,' the question of the superiority of Ligurians was discussed by the most able men of that country; and, so far as I could judge, the bulk of disinterested evidence was not in favor of Ligurians, and objections were made by honest men to their bee journals being edited by dealers or interested parties.

"Ligurian bees have been in this country about twenty years: why then go to America for evidences of their superiority? Is there nobody who can prove their superiority in this country, where the weather greatly hinders other bees? Has honey been obtained from them when common bees could not work? I am visited by respectable bee-keepers from all parts of the country, and those who keep Ligurians, as well as those who live where they are kept, tell me that they are no better than common bees. I am not prejudiced against them in any way, and shall be pleased to see evidence of their superiority from any trustworthy quarter; but nothing but facts are admissable as evidence. When these are produced I will speedily rid my garden of lazy bees, as my object in bee-keeping is profit. We shall be abundantly gratified if satisfactory evidence be presented to the readers of this journal and the bee-keepers of Great Britain that a superior bee is among us. In my search for evidence of the superiority of Ligurian bees I have been unsuccessful for ten years. Perhaps we shall be more fortunate during the present season."

Dairy Husbandry.

CONCERNING MILK AND THE CAUSES INFLUENCING ITS COMPOSITION.

THE investigations of HENRY A. MOTT, Jr., E. M. Ph. B., of New York, on the subject of milk, are of interest. Mr. MOTT sends us a small pamphlet of which he is the author. It treats upon the "comparison between the milk of the African race and that of the Caucasian," and we shall refer to Mr. MOTT's investigations, the results of which he has embodied in this pamphlet, because the facts brought out will, in a general way, apply to the milk of animals, and may thus be made useful to dairymen.

Milk is a product of the blood, and of all the secretions which are elaborated from the blood there is none which comes so near it in chemical composition, and hence we find all the chief characteristics in the formation of milk to be similar in animals and the human race.

CONDITIONS INFLUENCING THE COMPOSITION OF MILK.

Among the prominent conditions that influence the composition of milk the age of the subject may first be considered. Chemists who have analyzed the milk of cows of different ages have observed the fact that the heifer, or young cow, yields a milk containing less water and more milk solids than that of the old cow. This is an important fact which dairymen should understand, as from it some practical lessons may be learned in regard to the age at which cows should be turned. If the fact is well recognized that the milk of aged cows is much less valuable than that yielded by younger animals, it is a strong argument in favor of turning milch stock in due season, because, in addition to the depreciated value of an old cow for meat, that of her milk must also be taken into account, and the two together make it evident that considerable losses are sustained by the dairyman who makes a practice of keeping cows until they break down or fail on account of age. In England the custom among the best farmers is to turn cows into meat when they have arrived at from seven to eight years of age. In this way a good price is realized, because the animal may be easily put in flesh, but if kept until she has grown old, as is often the practice among dairymen in this country, she is not considered worth fattening and is sold for a mere trifle.

Mr. MOTT refers to a series of experiments made by VERNOIS & BECQUEREL in regard to age as influencing the composition of milk, and on this point they arrived at the following conclusions:—"That the milk of a woman between fifteen and twenty years of age contains less water and more milk solids (especially fat and mineral salts) than a woman between thirty-five and forty years of age, and that with respect to these two constituents they seem to vary gradually with the age of the woman." VERNOIS & BECQUEREL found 13.015 per cent. of *milk solids*, of which 3.738 per cent. was *fat* and .18 per cent. inorganic salts, in the milk of a white woman between fifteen and twenty years of age, while in that of a white woman thirty years of age there were only 11.191 per cent. of *milk solids*, of which 2.864 per cent. was *fat* and .144 per cent. inorganic salts. The same relative difference was found by MOTT in the composition of the milk of colored women of different ages. Thus he found in the milk of a colored woman sixteen years of age 15.01 and 15.11 per cent. of *milk solids*, of which 5.12 and 5.15 per cent. was *fat* and .41 and .42 per cent. inorganic salts; and in the milk of a colored woman of eighteen years he found 13.54 per cent. of *milk solids*, of which 4.05 per cent. was *fat* and .69 per cent. inorganic salts. In a colored woman of thirty years of age he found only 11.75 per cent. of *milk solids*, 2.54 per cent. of *fat*, and .31 per cent. of inorganic salts.

It will be seen, therefore, that the milk from colored women depreciates with age in milk solids (especially fat and mineral salts) in about the same proportion as the milk from white women.

THE COMPOSITION OF MILK DIFFERS IN DIFFERENT PARTS OF THE UDDER.

A few weeks since we gave the results of some experiments in analyzing milk taken from different quarters of the cow's udder, in which the remarkable fact was shown that milk drawn from the right side front quarter exhibited a specific gravity of 1020.4, while the left side front quarter gave milk of a specific gravity of 1021.3; the right hind quarter gave milk of a specific gravity of 1023.0, and the left hind quarter 1023.5. The milk was drawn from the different parts of the bag of the same cow and at the same time, the animal being well cared for and fed on meal clover and other food calculated to give a good quality of milk. Now Prof. MOTT finds a difference in the composition of the milk drawn from the different parts of the breasts of the same women, his analysis of milk from colored women showing that the milk of the right breast is richer than that of the left in the proportion of 1.06:1 for the minimum and 1.13:1 for the maximum. He refers also to the experiments of LOUIS SOURDAT, in which it is shown that the milk of the right breast is much richer than that of the left breast of the same woman, in proportions which are 1.20:01 for the minimum and 1.74 for the maximum. SOURDAT found that the right breast secreted the most fat—1.40:1 (minimum) and 9:1 (maximum). MOTT found the proportion of fat in favor of the right breast 1.20:1 (minimum) and 1.50:1 (maximum). SOURDAT found the caseine in favor of the right breast 1.90:1 for the maximum, and MOTT only 1.02:1 for the maximum.

These differences in the composition of milk are singular, to say the least, and physiologists, so far as we are informed, have never attempted to explain the causes.

INFLUENCE OF COLOR ON THE RICHNESS OF MILK.

Another peculiar feature in respect to the composition of milk is that it varies in richness according to the color of the subject from which it is produced, thus, in the human race, the milk of brunettes being richer than that of blondes. Mr. MOTT gives a table drawn from the different analyses made by L'HERITIER, in which the most marked differences are presented, as in the following:

	Blonde.		Brunette.	
Water	89.20	88.15	85.33	85.30
Milk solids	10.80	11.85	14.67	14.70
	100.00	100.00	100.00	100.00
Fat	3.55	4.05	5.48	5.63
Caseine	1.00	0.95	1.62	1.10
Milk sugar	5.85	6.40	7.12	7.00
Mineral salts	0.40	0.45	0.45	0.45

"It will be seen," he says, "from these analyses that the milk solids in the milk of the blonde was only 10.80 per cent. and 11.85 per cent., while in the milk of the brunette the milk solids amounted to 14.67 and 14.70.

"If a mean of all the analyses made by L'HERITIER bearing on this point be taken, the difference between the amount of solid constituents in the two cases would be less marked, but they still show quite a difference, the average ratio being 12.0:13.4. The researches of VERNOIS and BECQUEREL indicate a greater proportion of most of the solid matters in the milk of brunettes, with a very slight difference in the proportion of butter in favor of the blondes. The milk of brunettes contained 4.65 per cent. of milk-sugar; of blondes, 4.47 per cent. And they found 0.3 per cent. more caseine in the milk of brunettes than in that of the blondes."

In the following table he gives the comparison between the milk of the African race with that of the Caucasian:

CONSTITUENTS.	Colored woman's milk; average of 12 analyses.—*Mott.*	White woman's milk; average of 89 analyses.—*Vernois & Becquerel.*	White woman's milk; average of 14 analyses.—*Simon.*	White woman's milk; average of 14 analyses.—*Tidy.*
Water	86.34	88 908	88.36	87.806
Milk solids	13.66	11.092	11.64	12.194
	100.00	100.000	100.00	100.000
Fat	4.03	2.866	2.53	4.021
Caseine	3.32	3.924	3 43	3.523
Milk sugar	5.71	1.361	4.82	4.265
Inorganic salts	0.60	0.138	8.23	0.285
	13.66	11.092	11.64	12.194

It will be seen by comparing the analyses given in this table that the milk of the African race (or colored woman) is far richer in milk solids—particularly milk sugar, fat and inorganic salts—than the milk of the Caucasian race (or white woman).

AN INTERESTING QUESTION.

A question of some interest is suggested from the above, and this is, does the color of animals have any influence on the quality of milk yielded? We know that milk varies in quality in different breeds, and indeed in different animals of the same breed; and it has been observed, also, that cows yielding very rich milk have a yellow skin. Indeed, so generally understood is this last characteristic, that yellowness of skin has come to be considered a sure indication of a good butter cow. But does the color of the hair indicate any peculiarity in the composition of the milk? So far as we are informed, we do not think that any investigations have been made in this direction, though among a great many farmers there is a prejudice against black-haired cattle as yielding an inferior quality of milk. But if the rule applicable to the human race in regard to the conditions influencing the quality of milk hold good also in animals (and it does seem to do so in most respects), then black-haired cows would yield milk containing more milk solids than white cows.

It will be seen from what we have said that there are some curious things concerning milk which are not well understood even by those who have paid considerable attention to the subject. By increasing our knowledge and extending our investigations concerning the nature of milk and its production, we are enabled to make a practical use of points which often appear at first sight to be of little importance, and with this view we refer the questions here discussed to the attention of dairymen.

SALTING THE MILK INSTEAD OF THE CURDS.

A CORRESPONDENT writes us that he has seen it suggested that cheese can be salted with best results when the salt is added to the milk instead of the curds, and he inquires "whether this plan has any advantages, and how much salt is required per gallon of milk."

We are not in favor of salting cheese by adding salt to the milk, for several reasons, among which may be named the large quantity of salt required and the spoiling of the whey for feeding purposes.

It is true the salting of the milk distributes the salt evenly through the mass and avoids the labor of mixing the salt with the curds; but these advantages are not sufficient, it would seem, to recommend its adoption among dairymen, and if the value of the salt and whey be taken into account, the gain by this practice would hardly balance the loss. We have tried salting the milk, but have not discovered that any improvement is made in the quality of the cheese, nor do we know that any improvement is claimed by such manner of salting.

The usual quantity of salt required for salting cheese when it is applied to the curd is from 2 7-10 to 3 lbs. of salt for 1,000 lbs. of milk. Now, if the salt was added directly to the milk before coagulation, it would require at the rate of about 3¼ oz. salt to the gallon, or over 20 lbs. of salt for the 1,000 lbs. of milk, or about 17 lbs. more salt than is required when the usual process of salting the curds is adopted. The whey, of course, retains the large remaining portion of salt, and most probably, therefore, could not be used in any quantity for the feeding of pigs or other domestic animals.

Some ten or fifteen years ago the salting of cheese by applying it to the milk was highly recommended by certain dairymen, and although many cheese-makers were induced to try the plan, they soon abandoned it, and of late we have heard but little of its advantages.

In salting cheese in the curds, care should be taken to have the salt free from lumps. It should be passed under a roller or ground in a mill made for the purpose, for unless it is reduced to a finely divided state it will not be likely to be evenly distributed through the mass—a point which is always essential in salting cheese.

TROUBLE IN BUTTER-MAKING.

WE are in receipt of many letters at this season in regard to the making of good butter. Several of our correspondents tell us that the butter comes soft, or it won't come at all, no matter how long churned, or that it is full of whitish specks when it does come, and so on to the end of what might be a long chapter. Now, to all these inquiries we must say it is the high temperature that is causing so much trouble. Keep the milk and cream cool and out of direct currents of air, and your troubles, or at least the greater part of them, will disappear.

The Vineyard.

PRUNING GRAPE VINES.

THE first practical ideas that were given to the American public, in regard to pruning grape vines, came principally from German vine dressers, who had been accustomed to tying the vines to stakes, in the valley of the Rhine, where the varieties grown require close pruning. They did not take into consideration that our native vines, or many of them, were by nature entirely different from those grown in Germany, and require a different system of pruning; consequently, the rules laid down twenty-five years ago, were to tie vines to stakes, one stake about six feet high to each vine, and then to confine their growth, by close pruning, to these stakes. This system was found to be radically wrong with our own thrifty-growing varieties, as the Concord, Hartford, Prolific and many others; and it has been abandoned by those who understand how to obtain the largest crops from such varieties.

I will illustrate the fallacy of this close pruning system on the Concord, which will apply to the most of our native varieties. Suppose that two vines be planted, which I will call No. 1 and No. 2. Number 1 I will supply with a trellis, as large as may be required to afford the vine to be extended upon it, so far as it would be *profitable*, in view of the quantity of grapes that it would produce, say twenty feet long by ten feet high. In three years, in good soil, the vine would, if pruned properly, cover such a trellis, and would produce not less than fifty lbs. of grapes, all ripened to perfection. This is no theoretical view of the case, as I have proved from practical experience.

Now, I will give a trellis to No. 2, six feet high and eight feet long, and confine it to those dimensions, and the third season it would produce about ten lbs. of grapes—not more, I am confident. This fruit would not be any better in size and quality than the fifty lbs. grown on No. 1. Vines produce fruit in proportion to the extent of their canes grown the previous year, where the soil is rich and where their roots can expand freely. Two or three vines, trained to a trellis twenty feet long and six feet high, would not produce over about ten lbs. each, if the canes are cut back to that space; nor would they produce any more grapes than a single one, if attached to a trellis twenty by ten feet. This fact shows that some of our native grape vines are capable of being extended over a large trellis, and do not require close pruning in order to yield large crops of perfect fruit.

Suppose that a large premium should be offered for the largest yield of Concord grapes to the acre, giving the grower from three to five years to plant his vines, and bring his system of training and pruning into a fair practical test? I would proceed as follows: The land being heavily manured with well-rotted stable manure, and a heavy coat of bone flour, I would set the vines in rows eight feet apart, and eight feet apart in rows, and give them a trellis twelve to fifteen feet high, the rows running North and South to let in the sun in the middle of the day at least. The object being to obtain the greatest product of grapes in a given year, I should not consider the expense of such a trellis at all. I claim that the higher a trellis is, if the vines are not too much shaded, the more grapes we can obtain. This rule, of course, only applies to thrifty-growing vines.

Now, if my elucidation as above be correct, as I claim, on what basis rests the rule so frequently published in the Agricultural papers, to "cut back," and to "pinch back" the canes of grape vines, till there is not much left of them! You cannot make a vine extend its roots over a radius of ten or twelve feet, while you refuse to let the canes expand over five or six feet. If you cripple the top you also cripple the roots of a vine; and I think that grape growers will learn in time to allow nature to have a little more to say in pruning than they hitherto have allowed.

In summer pruning it is right to remove shoots that are of feeble growth, and especially such canes as are found growing up around the bases or collars of the vines. At this season of the year, when most of the canes have made their full growth, the ends of the smaller fruit-bearing canes may be cut back to within two leaves of the fruit, if such canes grow out at right angles with the trellis, as a matter of improvement in the appearance of your grape arbor or trellis; but I doubt very much that the grapes mature any better for so doing. If it be a fact that the fruit on one cane will be improved by cutting it back to within one or two leaves of the grapes, does it follow that the grapes on all the canes would be benefited by cutting them all back in like manner? And if it benefits the fruit to remove a portion of the leaves of the vines, why not benefit it still more to remove them all?

Thirty years ago, physicians were in the habit of drawing a pint of blood from every patient—no matter what his disease was, he must be bled! The consequence was, that they gradually drew out the living principle of the unfortunate people who fell into their hands. Many grape growers are now doing the same thing to their vines. They think that if a certain amount of sap runs through a cane bearing fruit, that if a portion of that cane be cut off, the entire vitality of the cane when uncut will be diffused through what remains of it. Mistaken idea! You may take two canes, each five, ten or fifteen feet long, and each bearing three clusters of grapes. If you cut one off to within a foot of the fruit, the grapes on the uncut cane will ripen just as early, and will be as good, if not better, than those on the cane that is cut off. The reason is, that the roots of the vine supply all the sap that the grapes and canes require; and, by cutting back canes, the fruit receives no more nourishment than it did before the canes were cut, because it can receive but a certain amount. The only way to improve the size and quality of grapes is, when a vine is heavily fruited, to thin out the clusters, and this should be done in June. My theory, as regards close pruning, cutting back fruit canes, etc., may not apply equally to all varieties; but I think if we enrich the soil more, supply higher trellises, thin out our grapes and prune moderately, we shall all get better crops of fruit than to adopt the close pruning system.

Linden, N. J. T. B. MINER.

[THE above, from an esteemed correspondent, gives the opposite of an article which appeared in this department, entitled:—"Stopping Grape Vines." Our readers, after reading both sides of the pruning question, will be better able to decide which to adopt than if only one were given in our columns. Of course they are well aware that we are in favor of close pruning and summer punching of grape vines, still we like to see all mooted questions freely discussed.—ED. RURAL.]

The Centennial.

CENTENNIAL CORRESPONDENCE.

PHILADELPHIA, July 15, 1876.

WALKING leisurely through Agricultural Hall, my attention was attracted by the all-embracing arms of ye wind mill of yo olden time which stands in the center of the main aisle about two-thirds its length from the entrance. The improvements in wind mills and their application to farm uses at once suggested themselves to me and I set about finding the modern examples of this prototype. One would naturally expect to find such an important exhibit placed conspicuously and in a manner that would furnish easy access to visitors. Not so, however. The Commission, with a fatuity or maliciousness that passes understanding, wandered about the premises, and after having tumbled down a ravine (now being filled with refuse) and clambered over a hill or two, came to the extremity of the grounds—the jumping-off place, so to speak—and ascertaining that a wind mill exhibitor would have to dig about seventy feet for water, and after erecting his mill would be placed in a nice, quiet, out-of-the-way corner, secure from visitors or intrusion of any kind, they concluded that they had performed their duty in a way that was, at least, quite satisfactory to themselves. The more one observes the doings of this wonderful Commission, when it is a question of agricultural affairs, surprise is aghast that such little heads can carry all they know!

The wind mills represented on the grounds are Halliday's, The Eclipse, Storer's, The McGregor, and the Hartford Automatic—all in constant operation.

The more one investigates the subject the greater becomes the conviction that the farmer does not adequately estimate the importance of this motor as a labor-saving machine on the farm. It is a saving of time and money, not to mention the convenience to be able to leave a trusty mill grinding away, like the mills of the gods, slowly but surely, while other and more pressing work is being performed, knowing meanwhile that the labor is being done as certainly as if you had an expensive engineer guarding your interests.

Again, it is very important to have a constant supply of pure water where cattle are kept, and this can be done for least expense with a wind engine. One instance is noted where a farmer had a herd of sixty cows that required the attention of two men constantly until a wind mill was erected. Then the men were dispensed with and the herd increased until it numbered ninety. Dairymen will be the first to admit that without a steady flow of good spring water it is useless to attempt to carry on butter-making operations as now conducted, never dreaming that a locality without spring facilities can be converted into a good dairy district by constructing a capacious reservoir, starting the wind mill, and thus secure a steady flow of water through the dairy. The water can, moreover, be drained back into the well after performing its appointed task and be reused constantly. Here is economy at both ends. The same reservoir serves as the means of embellishing the grounds, fountains being supplied by water which, once used, repasses by means of an overflow drain back to the well. I have merely stated a few of the uses, as they have occurred to me, to which the wind mill can be put, not pretending to go into an exhaustive essay on the subject.

Southern farmers are learning that by the use of the wind mill rice culture is once more becoming profitable on a small scale, it being an easy matter to flood fields and hull the rice. Formerly, to hull rice, it was necessary to transport the crop some distance, where milling facilities were abundant; but that has all changed, because of the fact that, appropriate gearing being attached to the wind engine, the planter can start his mill, lock the door, and go away content, as night and day the work goes on without attention and at the minimum of expense. In this connection it would be well to say that there is on exhibition in Agricultural Hall an improved Rice Huller, which is constructed of an adamant substance (emory, I believe), which enables the planter to hull his rice to the best advantage. It is cheap, and claimed to be durable.

It is scarcely necessary to dilate further on the importance of this subject to farmers. I would urge, however, that those visiting the Centennial give this exhibit their earnest attention, feeling sure that they will receive much practical and instructive information from the gentlemen who have the department in charge. Foreigners are enthusiastic over our wind mills and are much more astute in their questions than are Americans interested in the subject. This is the more peculiar, seeing that their own mills are so primitive. Our makers will probably have an opportunity to spread their wings in foreign lands, as the result of this close investigation and competition.

Y. R.

THE RECORD OF A BARBARIAN.

July 17, 1876.

THAT Russia is a remarkable country all will admit, and straightway the reader, I presume, will revert in memory to geograpoical reminiscence, commiserating the low moral and intellectual tone of her millions of inhabitants, while imbued with a wholesome wonder at the vast extent of territory under the sway of one monarch. It is the real estate aspect of the subject that the most often occurs to the uninformed, contemplative mind, when speaking of all the Russias. In this category, paraphrasing the late Artemus Ward, "of whom I was which," I judge are ranged nine-tenths of intelligent Americans. It is only necessary to see this country's display at Philadelphia to frankly admit that an effete (?) despotism is capable of successful endeavor in the arts of civilization that is simply astounding. This progress is the more instructive from the fact that, as a nation they have accomplished the hitherto impossible feat of getting into their own boots, and lifting themselves up by the straps! This simile seems the best to express the fact that Russian art is *sui generis;* that it owes nothing to the example of older civilization, but has constructed its art, as the German did his camel, from inner consciousness.

Although the last nation to get its display in shape, owing to an accident in transportation, its space in the Main Building is much the most unique, and in many respects quite the best, in the Exhibition.

Wandering among the show cases the visitor is dazzled by a wealth of gold and silver tissues, inwrought with velvet and damask, in patterns quite unfamiliar, on the one hand, while the maze of Malachite tables, mantels and set pieces is like a vision of a new kind of golconda. The Malachite, crude and worked, is the gem of the display to wonder-seekers, and one is reminded of the point and force of the anecdote related of a Rothschild who was displaying to a Russian prince a superb set of jewelry of this material, counting on the beholder's wonder and admiration, when the prince cooly remarked, "Yes, quite pretty; I have a *door* just like it!" When I say that the price of a small Malachite center table is $7,000, one can be properly astounded, as was, no doubt, the great Hebrew.

In art silver work they are no less expert. Indeed, the finest *repouse* work in the Fair is credited to this nation, which, until its advent, was awarded to the Americans. And this is the work exclusively of native artists, from national designs. Appreciating its merits, our Messrs. Tiffany & Co. have secured some of the most striking designs for models, while that veracious institution, the Pennsylvania Museum and School of Industrial Art, with an intelligent enterprise worthy of all praise, has not been a laggard in appropriating striking examples of Muscovite genius in various departments.

Failing illustration, I cannot give an idea of the exquisite texture and artistic coloring of their silks, the entirely unhackneyed forms of beautiful jewelry, the incomparable collection of valuable minerals, and it only remains to add that in ordinary materials and subjects, even to manufactured rubber goods, they show proficiency that leaves the beholder in dumb surprise.

Americans "point with pride" to their educational system, but I must sadly confess, as compared to the apparatus and system displayed by the Podagogic Museum, we do not even know the rudiments of the art of teaching. I regret that space will not permit the publication of a synopsis of their scheme, or even a brief mention of the methods of the system. In machinery thoroughness and finish is apparent on all sides. The trophies of iron will delight those skilled in metallurgy, while the beautiful models of machinery, iron-clads, docks, army accoutrements, etc., are very interesting. Russian inventive genius has antedated our "type-writer" and improved on it;—a type-writer being on view which not only prints words, but can set its own music to fit them as fast as the ideas are originated in the composer's brain.

In Agricultural Hall I found the exhibit no less complete and interesting. The traditionary muscovite is not a cleanly fellow; but here are great blocks of soap, mottled and plain, of a size that would seem to warrant the notion that they were compounded for the express purpose of washing away all traces of original sin, or at least for the sole use of a family of Cardiff giants. If sealing-wax is any indication, the Russ must also be a great letter writer, and the national spirit adheres by a superior quality of home-made Port land Cement.

The Agricultural and Horticultural establishment at Ouman show cocoons and spun silk in admirable profusion, and iron minimum is converted into a chemical paint which I have yet to see surpassed. The Schlippe Chemical Works of Moscow prepare and exhibit chemicals and poisons, in a form that would seem to rob suicidal death of half its inconveniences. It is only necessary to add that in Russia the ladies are great smokers to convey an idea of the confusing array of cigarettes that are adapted to all without distinction to race, color or previous condition of servitude. This people is nothing if not national, which is exemplified in the universal dish—sour cabbage soup, which has been solidified like our condensed preparations. It is an appetizing dish—to those who have stomachs like a Russian, or who have no aesthetic objections to a flavor of rancid oil supplemented by coal gas.

The cereal products are fine, as are also the fruits, nuts, etc., while forest tree culture is amply illustrated with specimens of bark, tree seed and segments of wood contributed by the Society of Forest Tree Industry. It is related how Peter the Great, whose private and individual tipple was brandy, was quite severe on inebriates, forcing high and low to sweep the streets when caught in a state of intoxication. It seems to have had no appreciable effect on the tastes of his subjects, judging by the extensive display of spirits and wines. The Brandy Distilling Co. of Karzan have a brand of "American brandy," the only instance noted where the stranger has made an impression on their customs. It is a powerful impression, too, about 93° proof. One brand has the suggestive appelation: "doppelt Korn," (doubled corned?) while a warning is conveyed in the bottles of currant wine by their incrustation of pebbles. They probably contain a fiery liquid, whose effects are to make one "*stone* blind ——!

It may not be generally known that gingerbread is dear to the national palate—not our ginger-bread, but an article that more resembles cocoanut-cake in appearance. It is shown in great quantity, and looked so tempting that I yearned to be on a committee to pass upon its merits.

Fertilizers, isinglass in all stages of preparation, and a most curious display of the wares in use among the peasantry complete an exhibit that, taken altogether, is more original and better worthy careful study than that of any other foreign country at the Centennial.

YOUNG RURAL.

Industrial Implements.

THE BENEFIT OF WIND MILLS.

EDS. RURAL NEW-YORKER.—Since the publication in the Illustrated Christian Weekly of a view of my seed farm, a prominent feature in which was a wind mill used for raising water, I have had a great many letters asking the kind of mill used, amount of water it would raise, whether it kept in order, &c. I have answered scores of such letters, but thought that perhaps a few facts on the subject in the RURAL might save others as well as myself some trouble, and would not be entirely devoid of interest to most of your readers.

In about the center of my grounds I have a pond, covering two acres, and supplied with water from a neighboring spring. A ravine runs through my farm, some 30 feet or more in depth and from perhaps twenty feet to several hundred in width. The pond is in the widest part of the ravine, and consequently about thirty feet below the general surface of the soil. A little stream constantly runs into the pond and one of the same size flows from it over a fall of several feet.

In transplanting time, we are usually troubled with severe drouth, and there is scarcely a season but some crop suffers materially for want of water, I thought if I could only get the water raised thirty feet and distributed over the ground it would be a great blessing, and as I had just returned from Holland, where I had seen thousands of wind mills pumping water, concluded to give the matter a trial.

One of my customers in Wisconsin manufactures wind-mills, and on a letter sheet which he sent me I noticed a picture of a wind mill, called the *Eclipse*, so I wrote him to procure all the information possible on the subject. The result was that I purchased a mill, 16 feet in diameter, erected it near the pond on the bank of the ravine. The water is pumped into large tanks, elevated above the ground twenty feet, and from these tanks the water is distributed through iron pipes all over my grounds, I am now in a measure independent of the clouds.

The mill is self-regulating, and therefore is no trouble, has not been out of order once since its erection three years ago, and the amount of wind we get and consequently water, is really surprising. We have never lacked for water once, and often have to stop it to prevent unnecessary pumping and waste of water.

I am quite sure wind mills can be profitably used by farmers not only in raising water, but in other farm work. In one view at *Schiedam*, in Holland, I saw three thousand wind mills all said to be engaged in grinding grain for the celebrated Holland Schnapps. I had before thought that this stuff was made of Juniper berries.

I said my mill needed no care, but it does simply need oiling.

JAMES VICK.

CHAMPION MILK-PAN AND COOLERS.

THE way to make the best butter is by using a good milk-pan and practical cooler, in addition to the other helps that all admit are necessary. The competition among butter-makers is quite as brisk as in other pursuits, and it becomes a momentous question how to secure the best pan and cooler at the least cost. We merely propound a conundrum which can be solved by those interested if they refer to advertisers announcements in the RURAL'S columns. The fact, however, of the "Champion Milk-Pan and Coolers" made by WILLARD & HAMMOND, Randolph, N. Y., having taken the first premium at the N. Y. State Fair, and that they have 1,500 in use, brings them prominently before the dairy public, and, as is our custom, we take occasion to briefly recapitulate the salient points of the apparatus as set forth by the makers.

It is claimed by them that but one-fourth of the labor expended in the old method is required to manipulate the milk—an item that appeals with direct force to the farmer's wife. Moreover, that more milk is produced, and of an equal if not superior quality, which means increased home comforts, by realizing a better price for the merchantable article to the extent of 15 per cent profit.

The pans and coolers are arranged in sets of four single pans within one large water pan, divided by partitions, permitting the water to circulate around one or all the pans, as the operator may elect. The set is arranged in a wood frame, is constructed of the best tin and painted on the outside, so as to prevent rust. The circulation of the water is constant and thorough. Many other points of excellence possessed by these ingenious milk-pans and coolers can be better appreciated by a personal inspection than by any written description.

The pans and coolers merit investigation, and we recommend our numerous subscribers who are interested in the dairy to procure full particulars from the makers, who will readily supply information gratis.

Farm Economy.

SAVE THE LOW-MEADOW HAY.

THERE are hundreds and thousands of acres of low meadows and swamps in the Eastern States producing a heavy crop of sedges and wild grasses, which would make a passably-good hay, if cut early and while in a succulent condition. But the greater part of this available forage is permitted to go to waste, or left until so ripe that it is worthless for fodder, then perhaps a small portion is gathered for bedding stock or mulching in the garden.

Can our farmers afford to waste this fodder, is a question for them to answer, although we think not, especially while good hay commands twenty to thirty dollars per ton in our city markets. We do not refer to grasses on the salt meadows near the sea shore, but to inland swamps and boglands, of which there are large quantities in almost every State in the Union, and large quantities near the older cities where everything of the grass kind commands a high price.

These bog grasses, if not wanted for fodder, will pay for collecting and spreading over the barnyard or in the stables to be tramped down and converted into manure. But thousands of tons of this valuable material is annually wasted, and we have seen more than one farmer's animals suffering for food in winter, and they could have been made happy with a stack of this very material, which, their owners will tell us, was not worth the gathering. It is to be presumed that no reader of the RURAL NEW-YORKER belongs to this class of farmers; but should there be none who are negligent in such matters, there may be some to whom a hint to cut their low meadows *early* will not be amiss at this time.

A HINT TO FARMERS.

FARMERS, write for your Agrteultural papers. Don't say "I can't" until you have at least made an effort. With all due deference to the Editors, the most interesting reading, to me, is the correspondence. In this we get all kinds of notions and all shades of opinions. Here is the great opportunity of gaining information.

When people of exactly the same views come in contact there is little to be learned. When we are *rubbed against*, then it is that the strongest arguments are brought out. The flint unused is worthless; it is only when it is struck against the steel that the sparks fly. Write and give *your own* experiences; but at the same time let us all be as charitable toward others as possible, giving all alike credit for good intentions.

Syracuse, N. Y. NELSON RITTER.

The Naturalist.

THE BRIGHTON AQUARIUM.

A CORRESPONDENT of the Forest and Stream, gives a very entertaining description of some of the curiosities to be seen in the Brighton Aquarium:

Just now the eggs of the octopus, or devil fish, may be seen in the various stages of incubation. And I may say here that the octopus is now one of the leading attractions, or "star performers" of the aquarium. The specimens here were taken off the coast of Jersey, and, therefore, may be supposed to be the little brothers of that giant devil fish which figures so largely in Victor Hugo's "Toilers of the Sea." In fact, Victor Hugo made the fortune of the octopus. But for him this marine curiosity might have dwelt in obscurity until now. The keeper kindly fed some of them for my benefit. Small crabs were dropped into the tank, and the little victims came tripping down through the water in their sidelong fashion, dancing to their horrid doom. As soon as the devil fish espied the crab he unfolded and stretched out his horrible arms, drew it under his body and sucked out its life. It was a sickening sight. The specimens here are not very large, their bodies being about the size of a man's fist, and their arms would stretch perhaps two feet across. One of these devil fish, placed in one of the octagonal vases for better inspection, sometimes escapes at night through the meshes of the wire netting over the top, a space only two inches wide. This would seem to be impossible, but the fact that these fish have only one bone in their bodies—it is in the head—and that one about the size of a nickle, explains how it may happen. The night watchman in his midnight rounds stumbles over something on the floor, stoops and picks up—a devil fish! The sea water is pumped by a steam engine directly from the sea into reservoirs constructed under the floor of the building, and thence conveyed to the tanks through pottery pipes by the same means. These reservoirs are capable of holding 500,000 gallons of water, which quantity can be pumped from the sea in about ten hours. The water in the tanks is constantly aerated and kept in motion by a stream of compressed air, supplied to the bottom of tanks through glass or rubber tubes. The circulation thus afforded is found to be preferable to the more costly system of pumping adopted by other aquaria, as it allows each tank to be heated independently of its neighbors. The whole of the tanks, forty-one in number, are numbered consecutively, and at the side is given the popular names of the fish plants and zoophytes which each contains.

I cannot attempt to enumerate here all the various fish and marine plants that this great aquarium contains. Some large tanks are given up to the zoophytes, anemones, jelly fish, corals, sponges and the like, of which there are most beautiful specimens. I saw a lovely tree coral from the Red Sea, and some of the beds of anemones look like a rich pasture of flowers.

The most attractive and popular feature of the aquarium just now is the sea lions from California. They are two young ones, and were received a month ago, two others having died on the journey. They are about half-grown animals, and now seem to be very healthy. Excursion trains run down from London, bringing large crowds to see them. They are quite docile, even affectionate, towards their keeper when he enters their cage, uttering a sort of dog's bark of delight whenever he approaches them. They are fed upon herring several times each day. The department of crustacea, lobsters, prawn, shrimp, barnacles is very well represented, and the gentle ascidian, which, according to the evolutionists, was our early ancestor, is here to be seen struggling up—or down—into a member of Congress. The present curator of the aquarium, Mr. John Parnaby, formerly of the Trentdale fisheries in Cumberland County, is quite well known among our own fish culturists, having visited our country several years ago. I avail myself of this occasion to acknowledge his courtesy to me on my visit to the aquarium. He accompanied me throughout, showing me all its varied mechanism, and allowed some of the fish to be fed for my amusement. Mr. Parnaby is one of the best practical fish culturists in England. One of the most important facts connected with this enterprise is, that, as an investment of capital, it has proved a "good thing." Mark this, ye men of Wall Street, it pays splendidly. The Brighton Aquarium was chartered by a special act of Parliament in 1868, and, therefore, does not require the inevitable word "limited" to be tacked to its title—with a capital of half a million dollars. It has paid ten per cent. to its stockholders, and the stock now stands at fifty per cent. premium in the market. The success of this one—the first in this country—has been so great that others are springing up, notably the Westminster Aquarium in London, near the Abbey of that name, which is to be on a very magnificent scale.

When it can be demonstrated that Aquariums pay so handsomely as a financial scheme it is probable we shall soon see one in Central Park or Boston Common. The Brighton Company is enlarging and improving its property in many ways. The roof of the aquarium has hitherto been laid out into a beautiful garden, replete with flowers and plants of every description, admitted to be the most delightful marine promenade on this coast, it being in full view of the sea; it is now undergoing a change. A large portion is to be converted into a skating rink, not of real ice, but of asphalt, to be used with the parlor skates, a kind of amusement that is very fashionable in England just now. A large cafe is to be fitted up on a portion of the roof for summer use. These extensive improvements involve a large outlay and new stock has been issued to raise the money. This has been taken by the old stockholders, so that there is no question that such shows pay well in this country. The admission fee is one shilling. Shall we not soon see an aquarium like this in America?

PROTECTING BIRDS IN FRANCE.

THE schoolmasters of France have had a new duty assigned them, *i. e.* to teach the children to protect the birds. M. Waddington, the Minister of Public Instruction, has just addressed a circular to the Prefects of Departments in France, on the subject of the preservation of insect-eating birds. He calls attention to the alarming increase in the ravages committed by insects of late years, and to the fact that this may be chiefly ascribed to the wholesale slaughter of the birds which prey upon them. The Minister requests each Prefect to call the attention of every schoolmaster in his Department to the subject, and to instruct them to teach the boys under their care how to distinguish between insects which are useful in agricultural districts, and to encourage them to destroy the one class, and carefully protect the other.

The evil effect of the destruction of birds, either by trapping them, or by taking their nests, is to be clearly pointed out to all the children, and they are to be reminded that under an existing law, they, or their parents are liable to considerable pecuniary fines if detected in such offences. M. Waddington also suggests that when occasion offers, the parents themselves might be reminded of the ulterior loss to which they are subject by permitting such destruction, and he desires the encouragement by schoolmasters of societies for the protection of useful animals among their pupils, such as have already been established in some parts of France, with the best possible results. By this official communication, the claims of small birds to protection will at once be brought home to each individual schoolchild in France; and though "boys will be boys" there, as elsewhere, it may be hoped that such an appeal to their good sense, or their fears of punishment, will do much to terminate a system of destruction which is as often due to mere ignorance or thoughtlessness, as to their innate love of mischief.

HOW THE OYSTER BUILDS HIS SHELL.

MR. FRANK BUCKLAND, who conveys instruction more agreeably than any naturalist of the day, thus explains the manner in which the oyster builds his shell. The body of an oyster is a poor, weak thing, apparently incapable of doing anything at all. Yet what a marvelous house an oyster builds around his delicate frame. When an oyster is first born he is a very simple, delicate dot, as it were, and yet he is born with his two shells upon him. For some unknown reason he always fixes himself on his round shell, never by his flat shell, and being once fixed he begins to grow—but he only grows in summer. Inspect an oyster shell closely and it will be seen that it is marked with distinct lines. As the rings we observe in the section of the trunk of a tree denote years of growth, so do the markings of an oyster tell us how many years he has passed in his "bed" at the bottom of the sea.

Suppose the oyster under inspection was born June 15, 1870, he would go on growing up to the first line we see well marked; he would then stop for the winter. In summer, 1871, he would more than double his size. In 1872 he would again add to his house. In 1873 and 1874 he would again go on building, till he was dredged up in the middle of his work in 1875; so that he is plainly five and a half years old. The way in which an oyster grows his shell is a pretty sight. I have watched it frequently. The beard of an oyster is not only his breathing organ, *i. e.* his lungs, but also his feeding organ, by which he conveys his food to his complicated mouth with its four lips. When the warm, calm days of June come, the oyster opens his shell, and by means of his beard begins building an additional story to his house. This he does by depositing very small particles of carbonate of lime, till at last they form a substance as thin as silver paper, and exceedingly fragile. Then he adds more and more, till at last the new shell is as good as the old shell. When oysters are growing their shells they must be handled very carefully as the new growth of shell will cut like broken glass and a wound on the finger from an oyster shell is very often poisonous.

WAS IT INSTINCT OR REASON.

THE New England Homestead, tells us the following story and asks was it instinct or reason?" We would say a little of both added to what is seldom placed to the credit of the lower animals namely experience. But here is the story:

As a farmer in a neighboring town was getting in his hay, he noticed an unusual commotion among the swallows, which had built a long row of nests under the eaves of his barn. They appeared greatly excited flying rapidly about and filling the air with their cries of distress. As the load of hay upon which he was riding passed into the barn, he saw that a young swallow in a nest directly over the door had caught its neck in a crack between two shingles and was unable to liberate itself. He stopped his team and set the young bird free restoring it to the nest. Upon his return to the barn with his next load of hay noticing that the swallows were quiet, he examined the crack, and found they had filled it completely with mud, so that no matter how enterprising or how foolish the young swallow might be, he could not again endanger his life or the peace of that community by any experiments upon that crack.

Scientific and Useful.

CHEMISTRY AND AGRICULTURE.

THE following article, by D. D. Worthington in the Maryland Farmer, may interest our readers as showing the dawn of scientific agriculture. With chemistry itself but little over one hundred years old, and with its application to agriculture less than forty—when we consider all that has been accomplished in this brief period—surely the future is full of bright promises for him who shall cultivate the soil availing himself of all the lights which scientific progress shall work:

"Chemistry as a regular branch of natural science, is of comparatively recent origin, and can hardly be said to date from an earlier period than the last third of the past century. * * From the very nature of chemistry it was impossible that it should take a truly scientific form until the *balance* was applied to it," which was first done by Lavoisier a little more than one hundred years ago.

In the opinion of many of our ablest writers on the subject, there cannot be, without the application of chemistry, scientific agriculture; and hence, agricultural chemistry forms a prominent part of the regular course of instruction in all schools in Europe and America, founded for the purpose of promoting agricultural knowledge.

In the year 1840, Liebig first began to investigate the secrets of vegetable and animal life. He had at that time attained great fame as a scientific author and teacher, and was excelled by none except the illustrous Berzelius.

The chemical laboratory founded by him attracted to it students from every part of the globe. He was first to discover the intrinsic connection between the plants and the mineral ingredients of the soil and to work out the discovery into a system.

Many years before his day, however, it was observed that sulphate of lime and other minerals were placed on fields with good results, but no one ever imagined the *necessity* of returning in some form the mineral ingredients carried off by crops. Under Liebig's direction many experiments were made, and the result proved beyond doubt the close connection between vegetable life and the mineral ingredients of the soil.

The following is an abridged account of his experiments made near Giessen: —"During the years 1845 to 1849, I made a series of experiments on the action of the different mineral manures, on a piece of land of about ten English acres, which I purchased from the town of Giessen. Previous experiments, which I had made in my garden in the town, had yielded no result. Whatever I might add to the soil, I was unable to trace any perceptible effect from any of my mixtures. The only cause that I could discover for this apparent want of efficacy was the composition of the soil of my garden, which, by previous cultivation and manuring, had become so rich in mineral constituents, that the addition of a relatively insignificant quantity of these substances, became, when compared with amount already present in the soil, quite inappreciable. This induced me to purchase the land alluded to, a sand pit to the east of the town, which I found to surpass all others in the whole district in its nearly complete barrenness for the ordinary crops. I do not believe that in a whole year, there grew naturally on whole ten acres as much grass as would have sufficed for a single sheep. I filled with the natural soil a number of flower-pots, in which I sowed wheat, barley and red clover, and manured each with some single mineral manure. In none of these did the plants get beyond flowering.

"Messrs. Schwarzenberg & Co. were so obliging as to prepare for me, a quantity of mineral manure, which was spread uniformly on the land. With the exception of the stable manure used for two lots, no ammonical manure, and no animal substance was applied to any part of the field.

"It was indispensable that some years should elapse, before the constituents of the manure could be rendered soluble, and thus diffused throughout the soil. * * * The fertility of the soil steadily increased, so that in the fourth year, the lots excited the admiration and wonder of all who had known the original state and quality of the land. * * * I consider myself as perfectly justified in concluding, from my experiments, that on ordinary farms provided we give to the soil the proper physical quality and composition, there may be, by degrees, such an amount of ammonia collected, or condensed, as to be more than sufficient, with the available mineral constitutents present in the soil, to obtain the maximum of produce for each soil."

The cost of the experiment, however, was over $3,000, and of course was regarded with ridicule, by "practical" farmers, and was given as an example of the absurd results following scientific experiments.

The object was not immediate pecuniary gain, but knowledge; knowledge, which at some future day, would be profitable.

Fifty years ago, sulphuric acid was handled by the professional chemist only, and even by him with dread; now it is used on farms, on a large scale, by men only one degree above common laborers. Notwithstanding the vast strides made in the past half century, our real knowledge of chemistry in reference to agriculture is very limited, and the special branch of applied science offers a fine field for further investigation.

MAKING WAX FRUITS.

MANY of our lady readers will doubtless wish to try their hands at wax fruit making this summer and the following on the subject from the Journal of Chemistry may be of assistance:

Closely allied to wax flower making is that of wax fruit, some specimens of which are marvelous for the faithful imitation of nature. Here molding or casting is of more importance than in flower making, seeing that accuracy of form is the chief desideratum. Most kinds of imitative fruit are shaped in double molds, one for each half, and, if the fruit is irregular in its curvatures, a tripartite mold may be needed. Say that an orange is to be imitated in wax, a smooth, damp surface of sand is prepared, into which exactly one-half of a good orange is carefully pressed. A cordon or border of tin or stiff paper is built up around it about half an inch distance from the orange on all sides; plaster of Paris in a cream-like consistency is then poured into the cell thus made so as to fully cover the orange; when quite firm enough to handle, this plaster half-mold is taken up and the orange extracted; the orange is turned over in the sand and another half-mold is made in a similar way. Whether fruit is cast solid or hollow, depends mainly on the size; if large the mass would be heavy and much wax wasted by solid casting; in this case a core of some rough material is fixed in the middle of the mold, which gives a cavity to the middle of the fruit.

Soft kinds of fruit, such as plums, cherries and ripe pears, and some hard and unyielding fruits, require special management to extricate them from the half-mold without injury to the fruit on the one hand or to the mold on the other. Pomegranates, medlars, pine-apples, etc. require molds in more than two parts. Occasionally elastic molds of glue are found advantageous. Generally speaking, the color of the wax employed is that of the lightest parts of the fruit, the deeper tints being afterward laid on with brush and pencil. The chief pigments employed are such as burnt and raw umber and sienna, chrome yellow, red lead, Prussian blue, carmine, lake, etc., greens being produced by various mixtures of blue and yellow.

Certain small varieties of fruit, such as grapes and currants, are made of glass bulbs, carefully blown to the proper shape; these are fixed by wax to wire inserted into holes, and are then dipped into melted wax of the proper color, a very thin coating of which gives the proper kind of semi-transparency to the glass and at the same time a smoothness of surface not inaptly resembling that of the natural fruit. The fastening of the various fruits to imitative stems, leaves, leaflets, etc., is an affair of wires, silken thread, strips of green paper, white flock, arrow-root-paste, gum-mastic, varnish, with other simple materials and tools used in artificial flower-making.

Floricultural.

THE WILD GARDEN IN AMERICA.

By William Robinson, Founder and Editor of the London Garden.

You have done me the great honor to request that I should write an article for the RURAL. I do so with pleasure, the more so because I have for a long time past found much precious matter in its pages and an aim as regards taste and style in gardening with which I heartily sympathise. It has occurred to me, in thinking over subjects likely to interest your readers, that a short article on the "Wild Garden," from an American point of view, would be as useful as any, mainly because I know something about the subject. Probably many of your readers will ask, "What *is* a wild garden?" and with your permission I will try to explain it. When I came to London, about fifteen years ago, "flower-gardening" had but one mode of expression only, viz: "bedding out," and that in its harshest form, ribbons, borders and solid masses of flowers of one color and one hight. The old hardy flowers had been completely swept away; the various and once popular race of so-called florist's flowers were rarely or never seen. As a consequence, gardens were indescribably monotonous to any person with the faintest notion of the inexhaustible charms of the flower world. This kind of flower-gardening has the same relation to true art in a garden which the daubs of color on an Indian's robe have to the best pictures. In fighting some years later, in the various journals open to me, the battle of nature and variety against this terrible daubing, I was occasionally met by a scorn and a ridicule of the old-fashioned mixed border which the bedding plants had supplanted. Now, a well-arranged and varied mixed border may be made one of the most charming features in a garden; but to so form it requires some knowledge of plants, as well as good taste. Nevertheless, the objection was just as concerned the great majority of mixed borders; they were ragged, unmeaning, and even monotonous.

I next began to consider the various ways in which hardy plants might be grown wholly apart from either the region of the bedding plants or that of the mixed border, and the wild garden, or garden formed in the wilderness, grove, shrubbery, copse or rougher parts of the pleasure garden, was a pet idea which I afterward threw into the form of a book with this name. In nearly all our gardens we have a great deal of surface wholly wasted—spaces in the shrubbery frequently dug over in the winter, plantations, grass-walks, hedge-rows, rough banks, slopes, etc., which hitherto have grown only grass and weeds, and on these a rich garden flora may be grown. Hundreds of the more vigorous and handsome herbaceous plants that exist will thrive in these places and do further good in exterminating weeds and preventing the need of digging. Every kind of surface may be embellished by a person with any slight knowledge of hardy plants—ditch-banks, gravel-pits, old trees, hedge-banks, rough, grassy places that are never mown, copses, woods, lanes, rocky or stony ground.

The tendency of gardeners has always been to suppose that a plant from another country than their own was a subject requiring their attention, not thinking that the conditions that occur in such places as I mention are, as a rule, quite as favorable as those that obtain in nature throughout the great northern regions of Europe, Asia and America. Here your common plants of the woods of the Eastern States are considered rarieties and coddled accordingly to their destruction. It is quite a phenomenon to see a flower on the little Yellow Dog's Tooth Violet, which I remember seeing in quantity among the grass in your noble Central Park. When one has but a few specimens of a plant, it is best to carefully watch them. But I have no doubt whatever that an exposed and carefully dug garden border is the worst place to grow many wood and copse plants (I mean plants that grow naturally in such places), and that in many cultivated situations here the American Dog's Tooth Violet would flower quite as freely as at home. Your beautiful little Mayflower Epigæa repens we have never succeeded in growing in our best American nurseries, as they are called, which grow your Rhododendrons and other flowering shrubs so well. I have no doubt, however, that if a number of young plants of this were put out in a sandy fir-wood, under the shrubs and pines, as I have seen them in New Jersey, we should succeed at once. Your beautiful Trillium grandiflorum is usually seen here in an open border, and it is always beautiful; but I once saw a plant in a shady position in a shrubbery, in rich, moist soil, quite two feet through and two feet high!

I mention these things to show that the wild garden may even have advantages from the point of view of cultivation. The advantages and charms, however, are far more than I can allude to in this article. One, however, I must point out, and that is the facilities it affords us for enjoying representations of the vegetation of other countries. Here, for example, the poorest soil in the most neglected copse will grow a mixture of golden rods and asters, which will give us an aspect of vegetation everywhere seen in American woods in autumn. This to you may appear a very commonplace delight; but as we have nothing at all like it, it is welcome. Besides, we in this way get the golden rods and asters out of the garden proper, in which they used to overrun the choicer plants and where they did much to disgrace the varied border. So in like manner you may in New England or New Jersey make wild gardens of such of our English flowers as you fancy. For example, the now numerous and very handsome varieties of our Primroses, Polyanthuses and Oxlips would probably succeed better with you in moist places in woods or partially shaded positions than in the open garden; but I naturally have no experience on this point. There can be no doubt, however, in which position they would look best. But let us suppose for a moment that there was no other object for the wild garden in America than growing the many lovely wild flowers that inhabit the land, it is sufficient. Here some of your wildlings are the darlings of our rock-growers, though we are far from possessing all the bright flowers and graceful trailers that adorn the bogs and woods and heaths of Eastern America. It would be most wise, in case of possessing a little bit of wood or copse adorned naturally with the trailing Partridge Berry and the rosy Lady's Slipper) (*Cypripedium acaule*), which I noticed so plentiful in some places, to preserve the spot as a wild garden and add to it such home and foreign beauties as one could obtain.

It is impossible in this letter to speak of the various types of wild gardens, but the opportunity which the system offers for embellishing cool, shady places is one which should make it interesting to the people to whose language belongs the term "shade trees." Usually flower beds and borders are in the full sun—a very proper arrangement in a cool country. But even in our climate there are in the warm months many days in which the woodland shade is sought in preference to the open lawn and when the fully-exposed garden is deserted. Many plants, too, love the shade, and we only require to plant the most suitable of these to enjoy a charming wild garden. It need not be pointed out to Americans that a vast number of herbaceous plants naturally inhabit woods. In America, where shade is such a necessity, the wild garden in the shade will be the most refreshing retreat near the country house. In it many of the plants common in the gardens of all northern countries will flower in the spring. For the early summer months flowers of a somewhat later period will be selected, as, for example, the later Irises—lovely hardy flowers, not, I fancy, sufficiently appreciated in America as yet, the tall Asphodel A. ramosus, the Day Lilies (*Hemerocallis*), the Solomon's Seal and some of its allies, the Veronicas, tall Phloxes, the great Scarlet Poppy (*Papaver bracteatum*), Sympbytums in variety;—these are are all free-growing and admirable plants for the wild wood-garden. Mulleins (*Verbascum*), Salvias, Harebells (*Campanula*), Willow herbs, tall Lupines, Baptisias, Geraniums, Galegas, Euphorbias, Meadow Rues, Columbines, Delphiniums, and the latest wind flowers (*Anemone*). Later still and in the sunny days would come the various beautiful, everlasting peas, various fine plants of the Mallow tribe, the Phytolaccas, Statice latifolia and other vigorous kinds, the Globe Thistles, Acanthuses, the free-flowering Yuccas, such as Y. flaccida and Y. filamentosa, the common Artichoke, with its noble flowers; and in autumn, a host of the Golden Rods and Michaelmas Daisies.

These are so common in America that adding them to the wild garden would probably be considered a needless labor; but the substitution of the various really beautiful species of aster for those commonly found and of inferior beauty would well repay the "wild gardener," if I may use the term. In case it were thought desirable in making a wild garden in a shady position to grow plants that do not attain perfection in such positions, they might be grown in the more open parts at hand and sufficiently near to be seen in the picture. The effects afforded by the bolder types will suffice in many cases.—[Conclusion next week.

FLORICULTURAL NOTES.

Another Swindle.—A friend writes:—"I saw in Fulton Market last week a huge pile of bulbs marked "Spanish lillies five and ten cents each—will blossom in about three weeks"—in the midst of which was a splendid specimen of *Amarylis Johnsoni* labeled "Spanish Lily in bloom."

There are people so wanting in knowledge of plants as to be unable to detect this fraud at a glance, and I have no doubt many who invested their dimes are now waiting impatiently for the appearance of the splendid flower they picture in their imagination; and when the flower appears (if any do appear) we hope they will restrain their indignation as well as did the Pennsylvania farmer who in view of the devastation of his fields by the potato beetle, feelingly remarked: "the spirit almost moveth me to eject vehemently sundry phrases sometimes used by the profane when under undue excitement."

[Years ago when they were first offered in the streets, we purchased one of these Spanish Lillies. It bore a mean, narrow, white-petaled little flower not worth a cent. Many people have to learn by disappointment that it is best not to purchase plants (especially bulbs) thus offered. Hundreds if not thousands of these worthless things are sold every season, and if this lesson of disappointment can be learned for ten cents, perhaps it is a pity to expose the fraud.]

Phormiums.—In the transactions of the M. H. S. it is mentioned that *Phormium tenax var.* (New Zealand Flax) was exhibited in flower for the first time by Mr. SARGENT. A mat was shown made from the fiber of this plant by the native Maoris of New Zealand prepared and woven with no other apparatus but water and stone.

The chairman deemed the variegated form one of the most beautiful of all variegated plants.

Mr. HOVEY said the common green variety did not seem to be very generally known. It can be grown without protection as far north as Charleston, S. C., and also in Ireland where it was grown by a nurseryman for strings which were made by merely tearing the leaves into strips. Mr. H. has used it in this way himself in a half green state and found it very strong.

It might be grown all through the Southern States. It does not require the protection of a greenhouse, but may be kept over winter in a cellar or cold frame. The roots are fibrous, so that it need not be potted. It has a fine effect on the lawn, where it should be associated with yuccas, agaves and similar plants. Although the variegated form is very beautiful, it was a question whether, if all plants were variegated, the green form would not be considered quite as beautiful. It is novelty which gives value to many plants. The plain green *Phormium*, with its tall, erect, sword-like leaves, is a grand sub-tropical plant.

Mr. BUSWELL believed the public taste was running wild on variegation. While some plants, from the breadth of their foliage and distinctness of variegation, were objects of beauty, others were so variegated as to appear at a little distance as if they were dying.

Cold in its Relation to Hight.—According to the Belgique Horticole, the intensity of cold at night diminishes up to a certain hight. This phenomenon was tested by M. MARTINS by placing thermometers in the Botanic Garden, and at various hights on the cathedral tower. In clear nights the increased warmth at a higher elevation is the most perceptible; in dull nights there is little or no difference. The reason of the great injury inflicted on the lower branches of shrubs etc., is thus accounted for. [We had thought it was the lower portions of shrubs that suffered least. The ground becomes heated during sunshine and the thermometer after sundown would show a higher temperature near the ground. Later by radiation the ground will become cooler than the air—a circumstance to which is ascribed the deposition of dew and frost. Mr. MARTIN'S tower experiments were not needed to prove that cold air is heavier than warm air. But it is a question whether the mutual radiation of the earth and the lower branches of trees and shrubs does not preserve a higher temperature within the radius of action, than the difference in temperature between lower and higher strata of air where there are no shrubs or trees.]

A Disguised Plebeian.—As an instance of how we are prone to prize the most common plants if grown in a manner to disguise them, we give the following from an old periodical:—Many years ago I had my office in Chambers Street, and having one day a good, large potato, I put it in a pot filled with earth, and then placed it in the window. It soon started into growth and kept on until the vine reached the top of the window and ran across to the other side. Hundreds of people in the course of a week would stop and look at that vine; occasionally one would venture in and ask for a cutting of that handsome vine, and act which added greatly to my amusement; for the idea that any one should be so ignorant as not to know a potato vine was certainly an amusing commentary on the intelligence of our citizens. It was a fact, nevertheless, and but one person ever came near guessing the name of my potato and he called it a tomato vine.

Rhus Cotinus.—There is no shrub more pleasing during its flowering and fruiting period than the Smoke Tree. The clouds which almost envelop it at this time pass through several changes of color, and this varies in different plants and, we think, is influenced by different soils and situations. Side by side, the "smoke" of one tree is the most tender pink; in another gray: in another the freshest, softest green, shaded with deeper tints as the growth is more matured. The green changes to rose and the rose to green, and all finally to gray its last tint as it is ofttimes its first. It is but here and there a fruit, resembling a pouch like the Shepherd's Purse, is formed—and these are enshrouded in the light feathery bracts that constitute the "smoke" from which the tree derives its familiar and highly appropriate name. These bracts, which botanists regard as abortive flowers, exist in compound racemes a foot in length terminating every stem.

Prince's Pine is now blooming in shady woods—a pretty little plant with leaves as leathery as those of a Kalmia of a dark-green color and a cuneate-lanceolate shape. These are in whorls of four to six upon half-creeping stems. The flowers—half an inch in diameter—are whitish with prominent purple stamens. They bloom in umbels of four or more raised upon long, naked peduncles and drooping from slender pedicels. It is good for ferneries or Wardian cases or among low creeping things in shady parts of the garden.

Mr. Leo. Grindon says, speaking of hybridizing and crossing Rhododendrons:—It shows, in the most pleasing manner, how floriculture, the first and finest of the fine arts, the most benevolent and the most civilizing, literally helps to "make the whole world kin."

Will not the London Garden tell us something of the Japanese Maples?

Arboricultural.

TO THE MIDDLE-AGED.

LET the following words of A. J. DOWNING be acted upon by the middle-aged as well as the young during our Centennial year. The fall will give all procrastinators an opportunity:—We Americans are proverbially impatient of delay, and a few years in prospect appear an endless futurity. So much is this the feeling with many, that we verily believe there are hundreds of our country places which owe their bareness and destitution of foliage to the idea, so common, that it requires "an age" for forest trees to "grow up."

The middle-aged man hesitates about the good of planting what he imagines he shall never see arriving at maturity, and even many who are younger conceive that it requires more than an ordinary lifetime to rear a fine wood of planted trees. About two years since, we had the pleasure of visiting the seat of the late Mr. LOWELL, whom we found in a green old age, still enjoying, with the enthusiasm of youth, the pleasures of Horticulture and a country life. For the encouragement of those who are ever complaining of the tardy pace with which the growth of trees advances, we will here record that we accompanied Mr. L. through a belt of fine woods (skirting part of his residence), nearly half a mile in length, consisting of almost all our finer hardy trees, many of them apparently full grown, the whole of which had been planted by him when he was thirty-two years old. At that time, a solitary elm or two were almost the only trees upon his estate. We can hardly conceive a more rational source of pride or enjoyment, than to be able thus to walk, in the decline of years, beneath the shadow of umbrageous woods and groves, planted by our own hands, and whose growth has become almost identified with our own progress and existence.

ARBORICULTURAL NOTES.

Larch Seedlings.—The Lawson Seed and Nursery Co., in England, is said to have commenced the present season's trade with 30,000 000 one-year-old Larch Seedlings, which were nearly all sold the first of March. The seed from which these plants were raised was all gathered from native trees in the Tyrolese Mountains, and it is said to be far preferable to that saved from trees in Britain. We seldom find the Tyrolese or European Larch producing good, fertile seeds in this country. The cones are abundant, but are generally filled with immature, shrunken seed.

Borders for Flower-Beds.—Tile act as a dam and hold the water. Dwarf-box and other perennial plants harbor noxious insects, and are more or less difficult to keep clear of weeds. The best edging for flower-beds is a good, clean and well-kept sward of some of the finer grasses. If it is not practicable to cut flower-beds out of a grass-plat, then employ some low-growing perennial, herbaceous or annual plant for edging.

Domestic Economy.

METHODS OF COOKING.

BY J. C. BUCKMASTER, F. C. S.
[Lecturer to British Science and Art Department.]

Boiling.—In boiling a piece of meat the vessel should be large enough to allow the meat to be entirely surrounded and covered with water, and sufficient to last the whole time of cooking. If the lid be kept on, the meat will be cooked in less time and with less fuel. Clean, soft water, when it can be obtained, should always be used, and filtered if necessary. If you wish to secure all the juices and flavor of the meat it should be put into boiling water, and then stood aside to simmer at a temperature not exceeding 190 degrees. Quick boiling will harden the tenderest piece of meat. The scum, which is chiefly coagulated blood and the dirt of the saucepan, should be carefully removed. The addition of a little cold water four or five times, in quantities of not more than a gill, will assist the raising of the scum. The time necessary is about a quarter of an hour to twenty minutes for a pound. Fresh-killed meat requires rather longer time than meat which has been hung a few days. A piece of string or tape, tied around the meat with a loop, will enable you to remove it from the saucepan without sticking the fork into it, which is always to be avoided, because the juices and flavor then go into liquor.

Stewing is a gradual simmering. It may be done in a saucepan over the fire, or in a stone jar which will stand the fire, with a lid fitting steamtight. The common red jar is not to be recommended; it does not stand the heat, and the glaze, which is a composition of lead, often gives way in the presence of salt. Stone jars are preferable to metal saucepans; they can be easily cleaned and they retain the heat better. For stewing, select clean meat, free from blood. The quantity of water should be about a quart to a pound of meat; but this liquor will be very rich, and it can easily be reduced, if necessary, with warm water. Add about a teaspoonful of salt to a quart of water; I think the salt is best added towards the end of the cooking as the tendency is to harden the meat. Peas boiled with salt pork will remain hard throughout the cooking. Bring the water gradually to the boil, remove all the scum, and let the contents simmer till the flavor of the meat is absorbed in the liquor. Remove all the fat, which can be eaten with bread, or used for puddings or frying.

All and every kind of meat can be used for a stew. They may be used together or separately according to taste or convenience. The better the meat, the better the stew; but by careful stewing the coarsest and roughest parts will become soft, tender and easily digested; which would not be possible by any other cooking. All the gristly parts—feet, shanks, knuckles—should be stewed. There is no other way of cooking these parts to advantage. They require time, and this is often the difficulty and objection; but what is to prevent a woman, when the family are all sitting round the fire in the evening, thinking about to-morrow's dinner? The fire which warms the children will also cook their dinner. The great vice of most women, not only among the poor, but among the middle classes, is that they never think of cooking till they feel hungry. Trimmings of all kinds of meat can sometimes be purchased cheaply.

A woman who has but little to spend should watch her opportunities. Sheep's feet, the shank bones of legs of mutton, and pieces of bone and gristle are often thrown away as useless. We used formerly to send ox-tails to the tanyard, and even now how much goes there which could be turned into good food. Twopence or threepence spent in the purchase of bones—although containing little meat, they contain 30 per cent. of gelatine, and may be made to yield excellent food; large bones should be broken into small pieces, and allowed to simmer till every bone is white and dry. I have said nothing about flavoring, or thickening or adding vegetables. As a rule, all vegetables, except potatoes, may be cut into slices and cooked in the stew; or, if preferred they may be cooked separately, and added afterwards. Carrots, turnips, parsnips, swedes, cabbages, leeks, onions, celery, beet-root, vegetable marrow—any or all of these may be used in a stew.

Roasting.—I believe I am regarded as a sort of heretic on the question of roasting meat. My opinion is that the essential condition of good roasting is constant basting, and this the meat is not likely to have when shut up in an iron box; and what is not easily done is easily neglected. Make up your fire, not by shooting on a scuttle of coal, but laying on the coal with your hands, using an old glove. Arrange the lumps of coal so that the air passes freely into the fire. By this arrangement you may avoid stirring the fire, which should be done as little as possible. Just before putting down the meat (which may be suspended by a piece of worsted, if you have no other arrangements) clear up the fireplace, and throw to the back of the fire all the cinders and a little small coal slightly wetted. This will prevent waste of fuel, and throw the heat where you want it—in the front. If you have a meat screen, place it before the fire, so as to get moderately heated before the meat is hung to the fire. Heat reflected from bright metallic surfaces never dries or scorches the meat. Arrange the dripping-pan so that no ashes can fall into it, and just as far below the meat as will enable you to baste it easily. If you have a little dripping or stock, put about a gill into the dripping-pan for basting. Place a newspaper on the floor; this will keep your hearth clean.

There is a right and a wrong way of hanging a piece of meat to roast. The thickest part should hang a trifle below the center of the fire; and if this can be best done by hanging the shank of a leg of mutton downwards, do so. The time required for roasting will be modified by circumstances; and different kinds or qualities of meat require somewhat different treatment. The time usually allowed is from fifteen to twenty minutes for a pound. Before removing the meat from the fire, press the lean part with the thumb; if the meat yield easily, or if the meat steam to the fire, it is done. Never sprinkle salt over the meat till about a quarter of an hour before it is ready. Pour away the dripping before using the salt, because fat used for puddings and pies and frying is better without salt. You may dredge a little flour over it, and every part should be of a nice pale brown; if any part be scorched or blackened you have failed in your cooking. Pour off the dripping, leaving in the pan the pure gravy free from fat. Have a gill or half a pint of the stock or broth, or water, ready; pour it into the dripping-pan, rinse it round, strain it into the dish, and send it to table as quickly as possible. Some cooks tie a piece of dripping or butter paper on the meat.

ORIGINAL RECIPES.

Johnny Cake.—One pint of sour milk, a small teaspoonful of baking soda, a tablespoonful each of sugar and butter, a half teacup of Graham flour, and corn meal to make a stiff batter. Bake half an hour in a quick oven.

Wafers.—Two eggs thoroughly beaten, a small pinch of salt. Mix stiff with flour, knead well, roll very thin, boil in hot lard.

Mrs. Rustic.

A Correction.—Eds. Rural: In my recipe for chocolate marble cake, instead of taking one teacupful of the batter, you have it latter.—Mattie Hiatt, *Winchester, Ind.*

SELECTED RECIPES.

Sweet Bread.—Parboil the sweet breads and let them get cold, cut them in pieces about an inch thick; put on salt, pepper and sage; then dip them in the yolk of eggs and fine bread crumbs. Fry them a light brown in boiling lard.

To Cook Cold Meat.—Put the meat into a chopping bowl, cut it fine, season with salt, pepper and a little onion; add half a pint of drawn butter. Fill a tin bread pan two thirds full; cover over with mashed potatoes which has been salted and has milk in it; lay bits of butter over the top and set it into an oven for fifteen or twenty minutes.

Cocoanut Pudding.—Grate the meat of one cocoanut. Roll very fine, and sift through a coarse sieve, five Boston crackers; mix this with the grated cocoanut, add a pint and a half of boiled milk and three tablespoonfuls of butter, just softened enough to beat; or, instead, one pint of thick, sweet cream. Beat six eggs—yelks and whites separately; add a cup of sugar; beat all well together; and bake like a custard. Eaten hot or cold.

Summer Sandwiches.—Take half a pound of butter, three tablespoonfuls of mixed mustard, three tablespoonfuls of nice sweet oil, a little white or red pepper, a little salt and the yelk of an egg; braid those together very smoothly, and and let it cool. Chop very fine some tongue and ham. Cut the bread thin; spread over the meat, then the bread, and press it together very hard. Trim off the edges, that the sandwiches may be all one size.

Pan Dowdy.—Pare and slice tart apples enough to fill, about two inches deep, a flat earthen or tin pan. To three quarts of apple add one cup of sugar, one grated nutmeg, one cup of cold water, and butter the size of a walnut. Cover this with plain pie-crust (have the crust about an inch thick), and bake slowly two hours and a half; then cover and set where it will keep hot one hour. Serve with sugar and cream. When done, the apple will look red. Do not break the crust into the apple after baking, as by this means you spoil the pastry. If you wish to have it richer, cover with puff paste.

Hygienic Information.

CHRONIC INVALIDISM.

Society, as at present constituted, is the unfortunate possessor of a constituency which may be dubbed a chronic nuisance. We do not propose sitting in judgment upon every cry of pain and anguish, nor do we plead ignorance of the vast amount of suffering with which the world teems. Without pausing, however, to discuss the question as to whether this state of affairs is brought about by a special dispensation of providence, or due to a flagrant disregard of the laws of health, we desire to record our protest against a class of individuals who are continually harping upon their many ills, imaginings and suppositions, with an eloquent pertinacity which would put to shame the professional efforts of a life insurance solicitor.

Every ache and pain, no matter how insignificant or transitory receives due consideration in the shape of the better portion of the day spent in bed, supplemented by a careful and minute diagnosis of the case delivered to the first unfortunate with whom he comes in contact.

If it happens to be our humble self we make up our mind to one of two things—either there is a morbid craving for sympathy or they have nothing else to do. If the former we are constrained to be lenient to the extent of mourning over their short-sightedness; if the latter we exclaim in language perhaps more expressive than elegant, *for pity's sake shut up!* If such people were ever inclined to take advice we would suggest that they desist from their present occupation and turn their talents in a direction in which they would at least command respectful considerations. When a person asks from the fullness of his heart, how you do, don't abuse the kindness by pouring into his sympathetic (?) ear a flood of lamentations and complaint. It only gives occasion for the application of a rather dubious compliment, which by-the-way is far too current new-a-days—"What an intolerable bore that person is."

If you are really ill it is not necessary to be untruthful, but do try and be as cheerful as possible. It would be a matter of world-wide interest if a statistician could be found competent to compute just what proportion of human suffering was superinduced by fear and imagination; how much due to ignorance of the fundamental rules governing the care of the body, or how much from a willful disregard of them and from hereditary and other sources.

Certainly it must be assumed that for every effect there is an adequate cause, and we claim that a very large percentage of ill-health is directly traceable to a morbid condition of the mind. There may be a thousand and one causes for this anti-normal state, as for instance, care, excitement, anxiety, worry &c. but we honestly believe that the principal cause arises from this continual, never-ceasing harping upon ones bodily ailments. It does you no good; on the contrary it only serves to aggravate what little reality there may exist, working under all circumstances incalculable mischief. It certainly isn't edifying to your neighbor to be obliged to listen patiently to such a gloomy recital. The brain is the great head and seat of health. To no other organ do the sympathies of the body so readily respond, and it is only necessary therefore to remember this fact to fully appreciate the absolute necessity of keeping the head clear and the mind conditioned.

Take a reef in your sanctimonious countenance, indulge in a smile, if only semi-occasionally, and our word for it, you will find something better to do than whining over your ills and aches.

Ridgewood, N. J. F. J. W.

NUTRITIVE PROPERTIES OF FRUITS.

That fruits, as a rule, have but small nutritive value has long been known. Every school-boy finds out for himself how soon hunger returns after a most liberal indulgence in his neighbor's orchard. Recently, the well-known chemist, Dr. Fresenius, has carried out a series of analyses with a view of determining the proportion of anhydrous albumen contained in various common fruits. In the following list he gives the number of parts of the different fruits he analyzed that are required to supply one part of albumen in the form of nutriment for the body:—Cherries, 117; English rounct apples, 192; currants, 222; grapes, 120; blackberries, 196; gooseberries, 227; apricots, 120; queen mother plums, 200; strawberries, 161; common plums, 210: pears, 385; raspberries, 183; peaches, 210; and white dessert apples, 254. Hence it follows that very nearly 4 lb. of pears would be required to yield as much albumen as is contained in an egg of 50 grammes weight, the per-centage of dry albumen in the egg being but 14 or 15 per cent. According to Professor Voit, of Munich, a man in ordinary work requires every twenty-four hours for his nutrition as much albumen as is contained in eighteen eggs, *i. e.*, 118 grammes; so that if it were required to give him the necessary amount in the form of pears, no less than 72 lb. *per diem* must be eaten. Notwithstanding these startling disclosures, the value of fruit as an article of diet, is not to be despised. Not only is it most easily digestible in itself, but by reason of the acid which all its varieties contain (though oftentimes so disguised by sugary matter as to be imperceptible to the taste), it aids in the digestion of other substances which are less amenable to the action of an ordinary stomach. But those persons who intend becoming vegetarians—especially if they have a falling for pears, and expect to grow fat on them—should be sure that their stomach capacity is sufficiently large before they entirely forswear the use of fish, flesh and fowl.

Insurance Department.

THE TRAVELERS LIFE AND ACCIDENT INSURANCE COMPANY.

While most insurance companies are content to make annual exhibits of their condition and affairs, and some perhaps would very much prefer to make none whatever, the Travelers persists in publishing its semi-annual statements with characteristic punctuality. Whether this is a recognition of the right of its policy holders and the public, or whether the company has always a record it takes pride in publishing so frequently, the fact remains that it has made out twenty-five of these half-yearly balance sheets, and each has been an improvement upon its predecessors.

All through these hard times, when new business has been so difficult that many companies make little or no efforts to obtain it, the Travelers has invariably shown at the end of each year an increase both of policies and insurance in force, as well as a continuous growth of assets. This time we take pleasure in chronicling an increase of a quarter of a million in assets and nearly fifty thousand in surplus, with a corresponding advance in every other direction. To do this at all is creditable; to have done this during the first six months of 1876, in spite of competition and all the unpropitious surroundings is, it appears to us, evidence of masterly management. One thing has made this achievment less difficult, the Travelers has done nothing to impair, and everything to strengthen public confidence in the ability and integrity of its management. Consequently, it has always done (not a great, nor brilliant, nor smashing, but) a good, steady and safe business, a business satisfactory to all parties. No doubt the definiteness and concise plainness of its policies have done much to promote permanency. Everybody can understand a policy that promises so much insurance for so much money, that disdains to tickle the fancy with ambiguous promises and dividends, and at a time when so many of these fallacies have been exposed, it is only natural that something permanent and definite should be preferred. The Travelers is one of the best of companies. There are not many that merit, in any particular, an unqualified and hearty indorsement; but the Travelers does, and has our best wishes.

INSURANCE NOTES.

Suicide and Life Insurance.—It is yet a mooted question, it appears, whether, whatever the conditions of the policy, the act of suicide invalidate the claim. In a recent case before the United States Circuit Court, at St. Paul, Minn., when the suicide was confessed, and the policy specially stipulated that the claims should be void in case the insured died by his own hand, sane or insane, the judges "thought that the question was of too much importance, in view of the general prevalence of life insurance, to be decided by any other than the court of final resort." The judges differed in their opinions whether the stipulations of the policy were or were not contrary to public policy. This is only one of a score of just such opinions so diverse in their character as to leave the matter only a more hopeless entanglement than ever. As a matter of equity, as well as public policy, it would appear that no party should, because of the act of another and irresponsible party, lose the indemnity purchased and paid for.

Panning out very Poorly.—The losses of the great fire in Chicago utterly destroyed nearly all the fire insurance companies of that city. The process of winding them up and paying, as far as their resources permitted, the claims against them, has been as tedious as the results have been unprofitable. Only three out of twelve companies involved paid as much as two per cent., and only one, the Republic, more than fifty per cent. And this comparatively handsome dividend was obtained chiefly from assessments levied upon stock holders who had paid in a portion of their stock, the remainder being represented by their notes, from which it appears that note assets, though often uncomfortable things for the stock holders, sometimes poor, as in this instance, are a sure reliance for the insured. They have one great advantage in that they cannot be readily wasted in imprudent management, though it may cost some time, trouble and expense to turn them into cash.

POLITICAL DUTIES.

WHILE the RURAL NEW-YORKER is not the organ of any political party and has nothing to do with political contests in any shape or form, the present is deemed a good time to say a few words upon a subject which nearly concerns the head of each of the thousands of families at whose fireside the RURAL is a weekly visitor. And what we have to say applies equally to the people of any and every political stripe and belief and is specially addressed to the rural population, who, living as they do in comparative seclusion and at considerable distance apart, and having less means of personal intercourse with each other than those of more thickly-settled districts, are more liable to feel the ill effects of the evil to which we allude.

The producing class of this country represent its wealth and solidity and comprise a large majority of all the voters. Yet in the office-holding fraternity this class develops such a sorry minority that we are compelled, by the striking contrast, to ask ourselves if it has become an absolute necessity that Farmers should be represented in the various legislative bodies by their Lawyer or their Doctor—a class of men, than whom, as a rule, no one knows less of the real wants and actual needs of a rural constituency. But these sorts of men are the *talkers* of the world and generally put themselves forward to do the representing for the *workers* of the world. They become the law makers and law executors who consent to accept for their labor (?) a trifling compensation which comes out of the pockets of the law abiders. From a beginning in the representative business, they extend their trade till they become the PROFESSIONAL POLITICIAN, than whom America cannot boast a more voracious, hungry, unconscionable and unprincipled animal. If this by chance should meet the eye of one of these animals he will probably laugh and grow fat over it, for no one better than he knows the facts of the case. If one of this breed of animals happens to be a candidate for office, inquire what his business is and you will be informed that he held office—and before that he was an office-holder and before that he was an employee of some branch of government. Is he in a pecuniary position to sustain the expenses of election and live while receiving such small pay? Oh! certainly. He is well off. How did he acquire his wealth? Well!—he has been a politician for years. Here you have the bottom facts. Here is the secret.

Much has been said about the terrible Pest, the Potato Beetle. Many poisons have been used for its extermination and numerous murderous plans have been concocted for its destruction; but if these people who are doing all this would only turn their attention to some social exterminator of the Professional Politician, they would soon find themselves amply compensated for their neglect of the potatoes by a greatly increased crop of reduced taxes and honest public improvements.

Much has also been written and said about overproduction being the cause of hard times. Now, there never has been in this country any such thing as overproduction from which such results could accrue except in cases of Grasshoppers, Potato Beetles and Politicians. The two first will be eradicated in course of time and the last you have now in your own hands.

During the present campaign, especially in case of town and county officers, industriously prepare your political Poison, in November next charge the polls in a body, and once and for all rid yourselves of this voracious pest, compared with whom the Western "Hopper" is a dyspeptic and the stripe-back potato chap is devoid of appetite. Once rid of this incubus it matters not to which party you belong, you *must* come out all right, in the end.

FAITH AND BELIEF.

DEAR RURAL:—In an article published a few weeks ago, you incidentally refer to the fact that the use of the words Faith and Belief, synonymously, has occasioned controversies and disputes. If it never had before, it has since the publication of the article, and some of the disputants will be very much pleased if you will point out the particular difference in their meaning. The writer is very sure that as they are used in such sermons and religious teachings as has come under her particular notice, it is difficult to understand how they differ.—J. A. W.

DESIRING always to grant all reasonable requests of our readers and thinking that others may be interested in the question, we are very glad to respond. But in connection we will say that the other words, Assent and Knowledge, are so often used with nearly the same meaning as Faith and Belief, we are inclined to give them a consideration in our answer.

As a simple illustration of what we mean we will suppose that a person coming into a house where you are sitting, makes the simple remark that it rains. Without thought or question you are impressed that it does rain, merely because he says so, and you *assent* to his remark. But immediately you notice his coat is wet; your reason comes to help and you say, This wetting is undoubtedly caused by rain, and you *believe* his statement to be true. Now, if you go to the door and see the water falling and feel it on your face or hands, you *know* it rains. But neither of these—Assent, Belief or Knowledge—is the result of or is in any way like *faith*. Should we try to reduce what we mean to a dictionary form of definition, we should put it more in form as follows:

ASSENT is the admission of the truth of a statement or proposition without subjecting it to any proof either of further evidence, reason or experiment.

BELIEF is confidence in the truth of a statement or proposition, after having examined the evidence so far as possible by the aid of Reason.

KNOWLEDGE.—When we have the testimony of our senses used in conjunction with our reason to attest the truth of evidence supporting a statement or proposition, we may be said to know it.

FAITH.—"The conviction of the truth of testimony" would be generally received as a brief and comprehensive definition of Faith as generally used; but as Assent, Belief and Knowledge may be all thus defined, it seems to be not satisfactorily concise. LOCKE says, "Faith is the assent to any proposition on the credit of the proposer." This may be used as well to define Assent and Belief and is not, it seems to us, sufficient.

FAITH is the conviction of the truth of a statement or proposition of which, from our nature, it is impossible for us to attain knowledge or to logically prove or disprove—as faith in the absolute; in the ultimate first cause of all things; in GOD.

In further explanation, let us quote from HERBERT SPENCER'S "First Principles of Philosophy," (p. 98,) where he says:—"Though the absolute cannot in any manner or degree be *known* in the strict sense of knowing, yet we find that its positive existence is a necessary datum of consciousness; that so long as consciousness continues, we cannot for an instant rid it of this datum, and that thus the *belief* which this datum constitutes has a higher warrant than any other whatever."

Whether one has faith in anything is conclusively shown in whether he is willing to govern his actions so that they shall be in accordance with his professions.

RURAL NOTES AND QUERIES.

Instructive Reading.—We expect to commence, next week, the publication of a series of articles treating on the Acquisition and Division of the Territory of the United States. So much of the history of America previous to the Revolution, will be given, in a condensed form, as is necessary for a complete understanding of the claims made by different Nations to American territory at that time. This will be followed by a recital of the causes that led to the erection of new States from the territory acquired since the Declaration of Independence, by treaty and purchase—and an account of the changes of boundaries and jurisdiction of some portions belonging to the Original thirteen States. In most of the histories with which our readers are familiar these changes are usually stated merely as facts without giving reasons therefor. The causes thereunto moving are often highly entertaining, and we err in judgment, if these articles are not pronounced by old and young alike, to be full of interest and instruction.

Neighbors Breeding a Nuisance.—The Colorado potato beetle is likely to cause some special legislation, inasmuch as there are scores of farmers who will plant potatoes and then not kill the beetles which feed and breed thereon. We have seen a number of instances of this kind the present season and as soon as the beetles have devoured the leaves of one field they immediately take to another, if it is in condition to supply them with food. Now it is a question which must sooner or later be decided in our courts, whether a man has the right to feed millions of this pest for a time, and then let them loose upon his neighbors' fields, who up to that time may have kept his potatoes clear of both beetles and larvae. A man has no more moral right to breed insects to prey upon his neighbors' possessions than he has wolves, bears, or other larger animals. If our laws do not afford the necessary protection then some should be made to meet the case in point, and that too very speedily.

That Dead Horse Again.—The old horse that was poisoned by licking Paris green from his legs while working among potato vines which had been sprinkled with this substance, must have many lives for we hear of him first in one town then in another, but it seems difficult to get any nearer than some neighbor who don't believe in poisoning the potato beetle, because *his* neighbor a half mile or mile away had a horse killed, &c.—the same old story over again. This horse reminds us of a certain boy who has been stung to death by the 17-year locust, (an insect which has no sting) for the last fifty years and still keeps on getting killed every time these big flies come around.

The Cost of Keeping an Herbarium.—The Massachusetts Horticultural Society have been discussing the question as to whether it was advisable for it to collect and keep an Herbarium for the use of its members, during which it came out that it cost something to keep a collection of dried plants as well as to procure one. The GRAY Herbarium at the Cambridge Botanic Garden requires the constant labor of three persons, one at least of whom must be a competent botanist, consequently calling for an annual outlay of several thousands of dollars. Cabinets of specimens of natural history are grand instructors, and always desirable on that account, both for individuals and societies; but the cost of keeping is frequently more than the making or price paid when purchasing. Our city young men often find out to their sorrow that the same is true in regard to keeping fast or even slow-going horses.

The Price of Pork and Corn.—One of our Western cotemporaries gives a table assuming to show what it costs to produce a pound of pork from corn at various prices per bushel. For instance, if corn is 50 cents a bushel pork costs 6 cents a pound. Now the question will arise upon what particular breed was this table of estimate founded, for there should be a great difference between the long-legged racers, so common in some parts of the country and the Berkshires or Poland Chinas, else wherein comes the merits claimed for the latter? The question for the farmer to decide, is what particular breed will give the greatest quantity and best quality of pork for a given quantity of food.

RURAL BREVITIES.

THE merits of the "Signal Service Barometer," made by H. W. POOL & Co., will be found fully set forth in our advertising columns.

THE Official Regulations issued by the Director-General which will govern the Live Stock Exhibition, will be found on another page. All exhibitors should read them carefully.

THE shipping of dressed meat from this country to Europe, bids fair to become a successful and money making enterprise. The people on both sides of the Atlantic are interested in this trade and we hope it will prove beneficial all around.

THE Pigeon fanciers are having some fine sport of late in racing with their finest birds. This is much better than Pigeon shooting, and we commend the "Carrier" to those who desire amusement, which need not result in cruelty to animals and certain debasement to the perpetrators.

THE statement which has been pretty extensively circulated that the Chinese employed at North Adams, Mass., have been dismissed and are to be sent back to China is untrue, and no doubt the story was started by some member of the Trades Union who would like to take their places.

VISITORS to the Centennial should not fail to call at the Kansas and Colorado State building, where there are many interesting things to be seen and none more so than the superb collection of natural curiosities collected by the indefatigable Naturalist, Mrs. M. A. MAXWELL of Boulder, Colorado.

EVANS' ADVERTISING HAND-BOOK, Centennial Edition, is the most gorgeously picturesque affair of its kind we have yet seen. After seeking for information in its pages, which will be found in a compact shape, it will be a cheerful diversion to take one more glance at that wonderful title page. T. C. EVANS, 252 Washington St., Boston, Mass., is responsible for this convenient Hand-Book.

PRACTICAL BOOKS upon subjects interesting to the Rural population, such as Architecture, Manuring, Dairy Husbandry, Live Stock, &c., should be a portion of the worldly possession of all our readers. We have just received from GEO. E. WOODWARD & CO. of 31 Broad street, New York, their new Catalogue, containing a full descriptive list of such works. All who are interested in them should send for the Catalogue.

IN the article descriptive of the Reaping machine of The Eagle Mowing and Reaping Machine Company of Albany, N. Y., published in last week's issue our typos (those scoundrels who always stultify Editors, you know,) made us speak of "telling" apparatus instead of the "tilting" apparatus. This is a *telling* joke on the scribbling department and justice to W. ANSON WOOD, the inventor of the Machine, compels us to *tell* about it, if we can do so without having a *till* with our printers.

DURING the last week in the RURAL Publication Office one day the air grew thick, darkness settled upon the earth like unto night and the signs portended some mighty convulsion of nature. To guess at the cause would have been useless so, waiting for some explanation, we were suddenly enlightened when we observed the appearance on our threshold of Jones of Binghamton—skates and all. The heaviness in the atmosphere was elucidated and we once more breathed freely. This latter sensation however, was considerably increased when we learned that he was to leave for home the same day. Verily, New York is a beautiful place to go away from at this season of the year.

BUSINESS NOTICES.

THIRTY-NINE years' experience in the manufacture of White Lead, warrants us in stating that our **"Phœnix" brand Pure White Lead** cannot fail to give entire satisfaction. Eckstein, Hills & Co., Cincinnati, O.

BABETTE.

ALONE; and the golden waters
Are rippling to the west,
And the chime from St. Roch's belfry
Dies on the ocean's breast,
And the dimpled waves are rocking
The fishers' barks to rest.

"Babette! Babette!" the mother calls,
Far up above the strand,
"Bring in your father's nets, my child,
And lend your little hand
To turn the wheel; nor linger there
So long upon the strand."

The sun is sinking in the sea
In crimson robes and gold;
A chilly breath the ocean stirs
And roughs her ringlets gold;
It feels to her like a farewell kiss
From lips now dead and cold.

The yellow light is on the wall,
The sea wall old and gray
With weed and lichen mantled all
In sober-hued array.
The children on the pier above
Are laughing in their play.

The quaint, old, red-roofed clustered town
Looks downward on the wave;
That sea from which her wistful eye
Some answer seems to crave;
That sea which took her love away
And gave her back a grave.

Oh, eyes that once so lightly laughed!
Oh, sad, sweet lips apart!
Once crushed with passionate kisses when
He held her on his heart.
That day she stood this wall beneath
To see her lover start;

To say again the last "God speed,"
And wave her 'kerchief white,
And smile in hope—ah, God, who raised
Those breakers wild and white,
And bade the tempest to arise
And rage that livelong night,

And smote the little quiv'ring bark,
And tore the planks in twain,
Deal gently with the broken heart
Of her who all in vain
Poured out her soul in fervent prayer,
Her love to see again.

No, not in vain. The morning dawned,
The sunshine glittered fair,
And bathed in light a battered corpse,
A gleam of golden hair—
God only heard the cry of her
Who found him lying there. [*Scotsman.*

Modes and Manners.

FASHION ITEMS.

NEW YORK, July 19, 1876.

CAMBRICS having once more become popular for street wear, it may not be amiss to give my readers a few hints as to the best way to do them up. In the first place cambrics—or, for that matter, any washable material—should not be washed in very warm water. Some of the best French cambrics will bear steaming, but as to ordinary goods, take Punch's advice to people about to marry, "Don't!" Do not rub soap directly upon the fabric, as it will be quite as likely to obliterate the color as the dirt. If two articles differing in color are put in the water together, the one containing the stronger dye will make the other colors appear mixed and indistinct. Cambrics should be rinsed in two waters after being removed from the suds, and dried quickly; but they should not be hung directly in the sun, as many of the colors worn this season are injured more in this way than by being wet. Starching should be done when the fabric is about half dry, as it will retain its stiffness better and iron more easily. By dissolving two ounces of gum arabic in a pint of boiling water and pouring a little of the preparation into the starch, any difficulty about ironing will be obviated.

The "pull-back" has certainly had its share of abuse, not unjustly, perhaps; but our modification of this foreign idea bears no resemblance to the extremes of the style across the sea. To such lengths, indeed, has it been carried, that the wearers now have their under-clothing "molded" to the form, and a fashionable promenade is quite as useful as regards the study of the human form divine, as the studio of a GEROME or a gallery of

4099

statuary. Let us hope the good sense of our countrywomen will forbid any such display on our streets.

I have selected for illustration a seasonable costume that verges on neither extreme and one that is very suitable for summer and fall wear. It is eminently appropriate for the street, making also a pretty traveling dress. The model is made of de Beige, being simply trimmed with the material and machine-stitching. The skirt corresponds to a pattern numbered 4413 (price 35c.) and hangs gracefully with most of its fullness falling at the back. The gores are sloped in such a way as to throw the drapery backward without the assistance of shirrs or tapes; while the back portion and side back gores are just long enough to sweep the ground gracefully. No decoration is used upon the skirt, though trimming could have been added without destroying its symmetry. The bottom is faced underneath for a finish and the skirt is lined, so that the shape will be well supported. The upper edges of the back breadth and side-back gores are gathered to the belt, but a plait turning backward over the side-front seam is laid before the remainder of the top is attached.

DRESS FOR SUMMER AND FALL WEAR.

The overskirt may be used for a walking-skirt if the drapery be omitted, as it is cut just like many of the short round skirts, with a front and side gore and a wide back breadth. The latter is gathered to the belt but the gores are joined plainly. A facing is sewed to the back edge of the side gore and a wide back breadth. The latter is gathered to the belt but the gores are joined plainly. A facing is sewed to the back edge of the side gore underneath about a quarter of a yard below the belt and is also sewed three times between the edges, so that four shirrs are formed. Tapes are passed through the shirrs and, after being drawn as closely as desired, are tied at the bottom of the facing so that they may be lengthened if required. Other tapes are tacked at the top and bottom of the facing and tied across to regulate the drapery. No decoration, except a piping below a row of stitching, is used to complete this overskirt, but that, as will be noticed, makes a very pretty finish.

The pattern for the overskirt is numbered 4397, which the RURAL will also furnish on receipt of 30c., the price. Cambric, lawn, organdie, etc., can also be made up in the pattern with pleasing results.

The sack is in one of those stylish shapes which are always certain to gain extended favor in fashionable circles. It has deep, square fronts that are perfectly loose and a half-fitting back which is quite short and jaunty. A dart takes the place of the usual under-arm seam, while the joining of the back and front is located so far toward the back that it seems to be a side-back seam. The front closes as far as the waist-line with buttonholes and buttons, while a Byron collar completes the neck and rolls over a lace-edged tie. The sleeves are in coat shape and are finished with pretty, round cuffs, the edges of which are decorated with piping and stitching to correspond with the rest of the garment. The pattern used in cutting the sack is No. 4398 (price 30c.) and is appropriate for any material, whether suit goods or cloakings.

The chip hat is a very jaunty affair, sitting well back on the head and flaring more at one side than at the other. It is faced underneath with velvet, while the outside is fully trimmed with loops of soft silk intermingled with roses.

Of late lingerie has assumed a very prominent part in fashions and justly, as nothing gives a prettier finish to the toilet than some one or other of these fichus, collarettes, bows or ties. Although insignificant in themselves, yet they seem to be the "*je ne sais pas quoi*," which gives a distinguished and stylish look to a costume; the last touch, here and there, that the painter gives his picture, not distinguishable by themselves, but quite the thing wanting to enhance the effect of the completed canvas. I have selected one of the prettiest, the "Cardinal Cape," which seems to be, this season, the general favorite. Description is almost superfluous, the illustration so admirably explains the article.

The pattern, No. 4099, is furnished in ten sizes (bust measure 28 to 46 inches) and costs 20c. A cape for a lady of medium size will require seven-eighths of a yard of goods 27 inches wide, or they can be made of lace, "bugles," or anything light and graceful that the individual taste of the wearer may suggest. Originality in fashion is always desirable, provided it does not tread on the grotesque.

In trimmings no decorations have so long remained popular as shirrings and knife-pleatings. They are seen almost as profusely this season as they were in the beginning of their popularity, the only apparent change being perhaps, a slight diminution in the quantity of shirrings used. Box-pleated flounces too, are appearing, and though they are but the revival of an old style they are welcomed as a change. Combination suits have box-pleated flounces edged with a band of the lighter shade both at the top and bottom, and set on the skirt above a pleated or shirred ruffle, or else one flounce laid in close box-pleats and not more than three inches wide. Sometimes two side-pleated flounces are used, each having a band of the contrasting shade let in above the hem; or a flounce, gathered so as to form a puff with a tiny standing ruffle for the heading, crosses the back breadths, while a side-pleating completes the remainder of the skirt trimming.

To return to the decorations used upon worsted over-dresses. Besides the deep facings mentioned a new worsted fringe appears. It has a netted heading at least two inches wide, to which worsted balls are attached by very short loops. Two widths were shown upon different suits, in a decided as well as an indefinite gray or dust color. It is a very stylish finish and is deservedly popular.

For white cambrics and piques, large quantities of Hamburg edgings are used, while for Swiss muslins Italian lace is almost exclusively adopted. Smyrna lace is also becoming popular for decorating outside garments of white or cream color, but it is too expensive to come into very common use. Plain lawns and organdies are trimmed with ruffles and pleatings of the same edged with Valenciennes lace; but the remaining patterns are all furnished with fancy woven borders, that are either pleated, gathered or sewed plainly to the lower edges of the over-garments and flounces, individual fancy directing the disposition in every instance. Many of the French prints and cambrics are provided with similar borderings, which form very pretty contrasts, especially in those dark-blues now so prevalent. There is one very noticeable feature about these fabrics in stripes and plaids, and that is the reverse side is frequently finished so that it may be utilized for such decorations as pipings, cordings, etc.

Unfortunately, I have again over-written the space allotted me and must, perforce, close this article abruptly. FROLIC.

The Story-Teller.

EGG HUNTING.

BY M. D. BRINE.

SLAP—DASH, down the dusty road comes TIM, the hotel chore boy, urging poor, lean, many-ribbed Dobbin to his utmost speed. The boy's short, fat legs are flying ungracefully from each side of the animal, and his loose jacket seems uncertain as to which portion of the dumpy figure it was first intended to fit. On they came, the horse and rider, and now Mrs. GREY drops her broom, forgets the dust upon the kitchen floor and rushes to the gate with wondering eyes.

"Seen anythin' of a little gal reound these parts?" yells TIM, excitedly.

"Yer ain't crazy, be ye, TIM BLAKE?" is her reply; "s'pose I hev; no cause fur you to scare honest folks in this way a dashin' down the road like all possessed."

"G'up! g'long!" is TIM'S only response, and Mrs. GREY chokes with the dust kicked up by the flying Dobbin's loosened shoes.

"Never did see the beat of that are boy!" mutters the farmer's wife, turning back to her broom and vigorously attacking the kitchen floor again.

Meanwhile TIM is out of sight and a farmer with two hungry little sons comes down from the meadow, expecting every minute to hear the welcome toot of the dinner-horn. And hark! there it sounds clearly on the soft air. And the three thus summoned quicken their steps to find the wife and mother awaiting them in the doorway.

"Guess what's happened, mother!" cry the two boys in a breath. "Little gal's lost up to the hotel. Awful time! every one's hunting her up, and—and—oh, luddy!"

Between the two, who interrupt each other during this narrative continually, Mrs. GREY comprehends the cause of TIM'S strange, mad gallop and puzzling question.

"La, now! that TIM BLAKE rid by here like mad a while ago and I larfed at him when he asked if a gal was round here. As if enny one didn't know I *never* had a darter—only boys, more's the pity!"

"Wall, you see, wife," says the farmer, dipping his face in the clear, cold water placed in the basin before him, "you see, me and the boys was a turning of the hay in the upper medder, when (another duck of his head) we see a crowd runnin' up the road yonder (rub, scrub with the coarse towel that made his bronzed face shine) JACK, he run over and asked the matter. (There, TOM, dump this water; give us a kiss now, mother) and found out that Mis' Sumbody or ruther up to the hotel—city lady, you know—had lost her young 'un—gal 'bout five year old or so. A lot of hulkin' thieves, gipsies, had been prowlin' round there, and folks said she'd mos' likely been took off by 'em. Anyhow, the lady's in an awful condition of scare and takin' on to kill. Now then for dinner! come boys."

Meanwhile at the hotel a half-frantic mother wept and bewailed the loss of her baby—the darling who had never before left her side, scarcely her arms. Everything pointed to the belief that the child had been stolen by gipsies, for one of the latter had been scoffed at and insulted by the servants that morning, and it was supposed the woman had thus revenged herself. So TIM BLAKE had been sent in one direction while others started

4099

in haste along other routes; but the day wore on and one by one the searchers returned without news. At three o'clock the stage came rumbling up and the driver, in answer to inquiries, said he "had seen a lot of thievin' vagabonds a good piece beyond the toll-bridge, but didn't see no child with them." The mother wept afresh at this discouraging news. "Where could her darling MARY be wandering? O! *who* would find her lost baby?" Thus she implored in piteous tones while the sympathizing crowd of boarders (and hangers on, as are always to be found at a hotel,) tried various ways to comfort her. But five o'clock came drear-

lly soon and still no news of little MAY, when TIM BLAKE at last returned and told his story as follows:

"Yer see, I flew like blazes arter them scoundrels—(here, you BOB HUNT, you just let my 'orse be, will you?) and by'n'by I seen 'em near MARSTON'S place, t'other side the tavern. (I say, stop that now, BOB, or I'll make ye!" kicking a soiled bare foot at the small-sized BOB WHITE, who was slyly tickling the mounted orator with a straw. "Aud I sez, sez I, 'Hold up, gyps!' and they sez, a turnin' round, 'Hold up yerself, yer scarecrow!' but TIM BLAKE can't be scared by such as them, no sir! And sez I back again, 'You just gin up that ere young 'un what don't belong to yer—so, now! And—and——"

"Then they licked you, TIM BLAKE, yer know they did, 'cause yer trousers is all torn—I see 'em," interrupted the hero of the straw, pointing to a portion of TIM'S clothing that betrayed his rough usage from the hands of the gypsies.

"Pooh!" cried TIM, growing red in the face. "I was sartain they hadn't no child and so I turned my 'orse home agin. Wait till I catch you alone, BOB! sure's I live and breathe, so now!" with which awful threat TIM slunk out of sight and poor Mrs. BLOSSOM was borne fainting to her room.

Another start was taken after the lost child and other mothers with pitying hearts and arms closely folded about their own safe little ones whispered softly together in an adjoining room.

"Come boys, fly about spry now. Get them eggs from the white hen's nest; heard her cackle more'n an hour ago. We'll get the market eggs in and father'll take 'em over airly in the morning. Fly now—off with you!"

Off they were in a trice, those two frolicsome boys, bare-footed, bare-headed, and brown as berries. Clickety-clack, down the road again and Mrs. GREY beheld another messenger from the hotel.

"Gal found?" screamed she.

"No, *marm!*" he called in reply, and was out of sight in a twinkling. The farmer's wife looked after her own sturdy little chaps as they chased each other to the barn and a tear glistened in her eyes as she thanked GOD for her treasures.

Cackle, cackle, cackle! How the old hens fly from one beam to another, angrily resenting the search after their property, while the young raiders clamber from hay-loft to hay-loft, filling their caps with the white treasures and pelting straw at each other gleefully.

And what is this that suddenly lifts itself from the far corner of the fragrant hay-loft and shakes itself from hay and straw? Only a little golden head, where curls are clustered thickly and tangled with hay. And a pair of blue eyes peep out from the gloom and shadows of that distant corner, silently wondering what is going on.

"What's that, TOM?" whispers JACK, grabbing his brother's pocket.

"Ain't yer 'fraid now, you coward?" sneers TOM; but nevertheless, he himself is backing down the ladder, JACK on top of him, and together they start for the house.

And thus presently was found the lost child. It was supposed that the gypsies had not dared carry her far away, but had drugged and placed her unobserved in Mrs. GREY'S loft and during all the search for her she was quietly sleeping there, guarded only by the staid old hens and in blissful ignorance of her mother's anxiety.

"A wonderful egg hunt!" exclaimed the farmer, when he carried in his own arms the little one to her mother. And JACK and TOM grew bashful suddenly because the pretty MAY BLOSSOM kissed them.

ONE OF THE JURORS.

RUTABAGA was discussing his customary morning meal of turnips, peanuts and water, when he received a portentous-looking envelope ornamented with variegated and picturesque seals. He had only that very morning paid his tax, killed a life insurance agent and hamstrung a book canvasser; therefore, he was at a loss to account for this intrusion on his rural solitude.

Being the descendant of a Swedish vegetarian, he never did anything inconsiderately or in a hurry—never pulled a subject up by the roots, as it were. Calling Mrs. R., he directed her to grasp the letter with the tongs and hold it over a slow fire until the seals melted, remarking that he would leave too many friends in a cold, uncharitable world if this missive should happen to be a dynamite trap of that impudent book agent. In any event, it would do no harm to be cautious and let Mrs. R. experiment. He had the best authority for considering woman as a helpmeet. As his fondest hopes were not realized and the package did *not* blow a certain person to immortal smash, he grasped the letter testily and learned that the committee, &c., had the honor, etc., to inform MARCUS CICERO RUTABAGA that he was and hereby is named a juror on the "Lightning Rod Competitive Trial Jury," and must at once repair to Philadelphia and await cloudy, threatening weather. The inclosed check would defray present expenses.

Bidding his wife an affectionate farewell, he was soon among a crowd of applicants for free passes on the grounds. Not moving briskly in the line the pert young clerk shouted, "Come! your turn-up, old man!" RUTABAGA acknowledged the compliment gracefully, saying he did have the honor to be descended from that branch of the vegetable kingdom, and receiving his pass, proceeded to the meeting of his Committee.

R. is not a linguist, but he grasped the hands of his foreign associates in five languages fluently and was at once on a peace footing. They went at once to business and visited the ground set apart for the trial. The day being bright and clear, it was decided not to have a trial but to examine into the merits of the various rods. Their catalogues enumerated only 1,219 firms exhibiting this sweet boon of an advanced civilization, so that their labors were comparatively easy considering the known habits of reticence of those engaged in this traffic.

RUTABAGA first examined the points of "The Concentric Twist and Patent Seducer" rod. The agent showed how the twist so confused the lightning once caught, that it ran into the ground thoroughly demoralized by its billion turnings and buried itself a hopeless, gibbering idiot, while their "patent seducer" points were never known to fail. Placed on churches, they had been known to materially increase the probabilities of success of prayers for rain. If Mr. R. would kindly give his address, he should be convinced of its merits by familiar observation. The agent looked as if the address was all that was needed to make his happiness complete. R. gave it and turned to an inspection of the exhibit of the "Concentrated Power and Motor Rod Co." This appliance was more specially adapted to manufacturing purposes. The electric fluid, by ingenious mechanism, was husbanded and made to drive machinery, run clocks, &c. If Mr. R. would kindly, &c., &c. He did, and just had time to investigate before lunch the "Nickel-Plated Defender and Utility Rod." "This rod was a platinum wire only," said the agent, "nickel-plated, as you see;" experience having demonstrated that the flash prefers, like death, a shining mark. The wire is run over each window, making a perfect burglar alarm; extended along fences, being the only sure cure for tramps; attached to beds as a remedial agent of unknown value for rheumatism; attached to infants and infirm people it will visibly affect them; and by extending the wire among the shrubbery in fanciful forms, the owner has a never-ending pyrotechnic display; the electricity constantly accumulating in a reservoir furnishes ozone, and completely changes the climate of malarial localities; it raises bread, houses, Cain, and is the only perfect remedy for sleeplessness. Would Mr. R. kindly?" &c., &c. He did, and in the afternoon went through the remaining list which, however, were of the usual kind, no noteworthy features.

RUTABAGA received a note from his wife saying the house was being beautifully ornamented; one side looked like rock candy, the other like a mass of plated ware, while the interior was as a spider's web for ingenious meshes. R. felt that he did not live in vain. No storms being reported, a requisition was made on the Signal Service and Probabilities instructed to have a first-class sirocco the following day promptly at 12 M.

We draw the veil; it being necessary only to add that the awards are in some confusion, a quorum of jurors not being present to render the report. The bodies of the Danish, German and French jurors were sent home in rosewood caskets at the expense of the Commission.

RUTABAGA'S illumination on the Fourth was the most dazzlingly brilliant for miles around. Mrs. R. is gathered to her fathers. The tramps are marching on to glory and R. has advertised for sealed proposals for a new barn, house and fences, to be built during his absence at the Hot Springs. He is writing a treatise on "Lightning Rods and their Uses," with practical illustrations.

TIMIDITY OF GREAT MEN.

TURENNE, being asked whether he was frightened at the beginning of a battle, said:—"Yes, I sometimes feel great nervous excitement, but there are many subaltern officers and soldiers who feel none whatever!" Conde was much agitated in his first campaign. "My body trembles," he said, "with the actions my soul meditates!" Frederic the Great, at Molwitz, gave but little promise of ever becoming a soldier. It is reported of one of the ablest friends of Washington that, in his first battle, his nerves quite gave way, and that he had to be held to his post by two soldiers; it was as if the hero's legs tried to carry him off in spite of himself. It is obvious to remark that distinguished men, whose nerves have thus completely broken down, may thank their stars for being distinguished. Much is forgiven them, for they did much service. Had they been common soldiers, they would have received as little indulgence for the automatic action of their feet as the poor receive for the malady of kleptomania.

There is, however, a special reason why allowances should be made for generals whose presence of mind has failed them. A private has only to shut his eyes to danger and to confront it with that *chien de courage* of which a great commander spoke with envious disparagement. But the skilled courage of a general is a virtue of a very different order. He must, as it were, have two selves. In deliberation, he must calculate the exact amount of danger to which he exposes his troops, and then, in action, the calculation must be erased from his mind. He must often say to himself, "Peace, peace," when he feels that there is no peace; and, by a sort of military faith he must fight as seeing a safety which is invisible.

It is true that Nelson exclaimed, "What is fear? I never saw it." But, at the time, Nelson was young; and against his remark may be set the saying of Charles V., when he saw written on a tombstone, "Here lies a man who never knew fear!" "Then," observed the Emperor, "he can never have snuffed a candle with his fingers;" or, as we should say, such a man can never have felt the first touch of the forceps of a dentist. Charles V., no doubt, spoke from a commander's point of view; and he may, like other commanders, have felt the difficulty of emulating the happy fearlessness of his soldiers.—*Fortnightly Review.*

The Literary World.

THE JULY MAGAZINES.

BEING a season of congratulations, we feel inclined to felicitate ourselves on our periodical literature. Compared with their prototypes, the English magazines, our monthlies have improved on the original method to such an extent that, really, we cannot understand how our English cousins can brook their inferiority. In matter, make-up and illustrations, we transcend all rivals.

Dr. HOLLAND appears to have views on the subject of magazines, and notwithstanding the current number of Scribner's Monthly in its twenty-four articles and departments, contains a more than usually interesting amount of matter, he, in conjunction with Messrs. SCRIBNER & Co., intend to paint the lily by issuing a "Midsummer Holiday Scribner," that shall comprise 160 pages profusely illustrated and be specially suitable as a specimen of the designers', engravers' and printers' arts. Not content with this effort, they propose extending the scheme, that it may embrace St. Nicholas also. These numbers will be in every respect noteworthy. The regular magazine reader will, of course, not fail to secure a copy. It will well repay casual readers to secure these special numbers.

HENRY JAMES, Jr.'s, new novel, "The American," grows in interest and the editor of the Atlantic, not content with this evidence of taste and enterprise, gives us in the July number a paper from the pen of C. D. WARNER. From "Joppa to Jerusalem," which throws new light on a segment of the Eastern question. An "Old Woman's Gossip," sustains its interest, while HOLMES' "How the Old Horse Won the Bet," is quite too good to be true. We should like to see "The State and the Railroads" issued in pamphlet form and very generally circulated.

Harpers' is the most tantalizing of magazines. The first number was undoubtedly good, all succeeding ones better, and we anxiously await an opportunity to chronicle the contents of the best. Alas! they continue in the comparative rut until it would seem improvement could no further go, when—presto! another month quite eclipses all former effort. The Magazine issued on the day next preceding the millennium will undoubtedly be the best; until that time they will be just stubborn enough to go on improving.

The Galaxy for June is, in one sense, a memorial number, containing, as it does, the late Gen. CUSTER'S article on "Battling with the Sioux on the Yellowstone." The now-familiar Centennary poem is, of course, the leading article. "July 4th, 1876," by J. M. WINCHELL, is brimfull of metrical patriotism. J. T. HEADLEY'S "WASHINGTON'S Headquarters at Newburgh," gives an interesting account of a locality around which cluster some of the most notable Revolutionary memories. ALBERT RHODES gives his experiences of "Life Among the Bedouins." Mr. RHODES is the *caviare* of magazine writers and always contributes articles that are a positive relish. "What Makes the Poet?" is a conundrum Mr. JNO. BURROUGHS answers. If he would tell why nine-tenths of our female population imagine there is a dearth of the article in newspaper offices, and straightway set about restoring a poetical equilibrium, it would assuage an ever-increasing wonder. RICHARD GRANT WHITE has "A Word with MAX MULLER" on the stupidity of attempting to introduce a phonetic spelling in place of our usual orthography. We are astonished to hear that Mr. WHITE has never heard of Bishop FRENCH'S "Study of Words," in which the same position is taken as that advanced by Mr. W. but, we think, more cleverly urged. No well-conducted magazine could exist, we presume, without "souvenirs" of some kind, and SHELDON & Co. have netted their "Man of Letters," who tells what he knows of defunct celebrities. All-in-all, the current number is very interesting.

"Wide-Awake" is more subdued than heretofore, the brilliant cover having been replaced by one of a more serious tone. Its contents are just as rich and varied as usual, which leads us to say that the youth of the present generation are more than fortunate in having two such journals as "Wide-Awake" and "St. Nicholas" to supply their mental pabulum.

Mr. FRANK MOORE is making a grand success of his "Record of the Year," which is not surprising with such a liberal firm as Messrs. CARLETON & Co. to carry out his ideas.

There is no good reason why every man should not have a private picture gallery when he can secure that superlative publication, the "Aldine," for the sum of $5 per year. To those who are confined to the city, it is a positive gratification to study the landscape in the last number. In fact, an "Aldine" and copies of Dr. KANE'S "Arctic Regions," would almost create an atmosphere that could bid defiance to the most ambitious flights of the thermometer.

PRAYER FOR HELP.

O HELP us, Lord! each hour of need
Thy heavenly succor give;
Help us in thought, and word, and deed,
Each hour on earth we live.

O help us when our spirits bleed
With contrite anguish sore;
And when our hearts are cold indeed,
O help us, Lord, the more.

O help us, through the prayer of faith,
More firmly to believe,
For still the more the servant hath,
The more shall he receive.

O help us, Saviour, from on high;
We know no help but thee;
O help us so to live and die,
As thine in heaven to be. [*Milman.*

SUBMISSION.

THERE is one little word that it takes us all our life to learn. We begin the task when, as little children, we first hear the word "must."

It is hard, even then, for the childish hands to leave untouched the coveted object; still, as the years pass on and on and we put aside our childhood, with its innocence and happiness, and take up the burden of life for ourselves, we find this first lesson of our youth yet unfinished. We have yet to learn the full meaning of that word, Obey. It was easier in childhood, because then we felt more the need of some higher power to direct our steps; while now, we so often let go the hand that leads us through the darkness of to-day, that we may come out in the light and glory of to-morrow, choosing rather to "Walk alone by night," finding at the end only the "outer darkness."

Again and again do we refuse to obey and then, when we find the folly of our own wisdom, we come back to the arms ever willing to receive us. When our lips have learned to frame the words and our hearts to feel, "Thy will, O GOD, not mine, be done;" then is life's greatest lesson learned. But oh, how many times before we finish that lesson will lips quiver and eyes grow dim! We are of "earth—earthy," and the heart will cry out when its cherished idols are broken; but

"The paths that have once been trod
Are never so hard for the feet;
And the lessons we once have learned
Are never so hard to repeat.
Though sorrowful tears must fall
And the heart to its depths be riven,
With storms and tempest we need them all
To render us fit for heaven."

RUTH MORE.

THE BOOK OF JOB.

I CALL that, apart from all theories about it, one of the grandest things ever written with pen. One feels, indeed, as if it were not Hebrew; such a noble universality, different from noble patriotism or sectarianism, reigns in it. A noble book; all men's book. It is our first, oldest statement of the never-ending problem—man's destiny and God's ways with him here in this earth. And all in such free, flaming outlines. Grand in its sincerity, in its simplicity, in its epic melody and repose of reconcilement. There is the seeing eye, the mildly-understanding heart; true eye-sight and vision for all things; natural things not less than spiritual. Sublime sorrow; sublime reconciliation; oldest choral melody as of the heart of mankind; so soft and great; as the summer midnight; as the world with its seas and stars. There is nothing written, I think, in the Bible, or out of it, of equal literary merit.

THOUGHTS FOR THINKERS.

WHOSO keepeth his mouth and his tongue keepeth his soul from troubles.

WHATEVER withdraws us from the power of the senses, whatever makes the past, the distant or the future predominate over the present, advances us in the dignity of thinking beings.—*Dr. Johnson.*

To sin against knowledge is a much greater crime than an ignorant trespass; as the crime which is capable of no excuse is more heinous than the fault which admits of a tolerable plea.—*Justin Martyr.*

THE husks of emptiness rustle in every wind; the full corn in the ear holds up its golden fruit to the Lord of the harvest; a good man's faith is manifested by his labors, standing not in words but in the demonstration of the spirit.

GOD'S ways seem very slow, sometimes. What we would see done waits long for the doing and we grow impatient. But if we believe in God we should possess our souls in patience. In his own good time every thing will come right.

TRIBULATION may come as a flood into the church; we may be disappointed even in the brethren; but those who have the eye fixed on Christ "hold on their way;" the word which they have heard and which they keep is a strong link binding them to Him, which is more than all else to them.

CHRISTIANITY is the true citizenship of the world; and universal peace and the free exchange by all lands and tribes of their several peculiar goods and gifts, are possible only as all are grouped around and united by the cross of a common Redeemer and the hope of a common heaven.—*Wm. R. Williams.*

Ladies' Portfolio.

IN SILK ATTIRE.

THESE are my lady's parlors,—
These dim, delightful rooms,
Gorgeous with well-bred splendors
And soft, artistic glooms,
Warm with harmonious colors,
And pleasant with faint perfumes.

The curtains are marvels of broidery,
Wrought skillfully, stitch by stitch.
The carpets are woven roses,
Moss-like and deep and rich,
And the marble face of Clytie
Looks out from her draperied niche.

The flowers are hot-house darlings,
Exacting, dainty and rare,
Tuberoses, and rich camellias,
Stately and waxen fair—
More the work of the florist
Than of nature's earth and air.

Think of the brave, bright asters
Fringing the autumn leas,
Of the golden rod with tresses
Tossed by the wild fresh breeze,
Lifting their common faces
Among such flowers as these!

The rude plebeian daylight
Dares scarcely to venture near,
But tempered by careful shading,
And timid from bashful fear,
With soft half-tones and touches
Makes tenderest twilight here.

And the queen of all this splendor
Sits shrined in her luxuries,
Her hands, unsullied by labor,
Are folded in graceful ease,
Showing no harsher contact
Than the touch of ivory keys.

Hush! do you envy my lady
Her treasures from many lands,
Her costly and rich surroundings,
Her white wrists' jeweled bands,
The diamonds which star her bosom,
And glint on her waxen hands?

No—covet her golden leisure,
Her freedom from petty cares,
From the burden of small denials
Which many a spirit bears,—
But never her soft inaction,
Nor the robes and gems she wears.

The vain, unused existence
She wears like a flowery wreath
Were chains to a soul more noble;
It would fret and strive beneath
The burden of useless living
As a dagger wears its sheath.

[*Florence Percy.*

INTERCEPTED LETTERS.—II.

NEW YORK, ——— —, ——.

DEAR MARY:—Forgotten you, mavourneen! As well might you intimate that the gracious orb of light, otherwise the Sun, had exhausted his supply of illuminating material, and that it had become my pleasant duty to enlighten a gloomy planet by the iridescence of my luminous optic.

You need pay no attention to this little flight of rhetoric, dear; rush of words to the brain. Our family appears to have streaks of this kind, otherwise, as you know, we are harmless lunatics. It is a real shame I have not answered your lovely letters. I have started a million times at least, but where's the use?—the moment I sit down to write I want to say so many things, and the bother of it is I think of them all at once, and a whole paper mill doesn't seem sufficient to supply material for my burning thoughts, and——let's see, where was I? Oh! and the fact is, Rosebud, I just want to see you, and have a good, long talk.

Been to Philadelphia? You unsophisticated fraction of rural economy, do you imagine I could live ninety miles from that perfectly gorgeous show and not take a glimpse at it? Ah! MARY, that same Centennial is the modern apple that will prove the destruction (financial, I mean, of course) of tons of the 19th century EVES. Of all the pomological temptations I ever encountered this is, as that horrid, vulgar TOM says, the "king pin." I don't know what it means, but it's expressive, anyhow.

Oh! I forgot. I saw the Doctor there, too. He didn't ask about you, of course not. I say, Chickadee, if you don't hurry up and dispose of that young fellow, I'll surely put some stubby old antiquary on his track and have him impaled in a cabinet as the best specimen extant of a perambulating corkscrew. The way he can draw information out of one is past belief. But I fancy I have paid him. I told him you were, at last accounts, receiving sealed proposals by every *male*, and that if he liked I should be pleased to furnish him with blank forms and specifications. I flatter myself he went off with a bee in *his* bonnet! You see, dear, I can't marry you myself, and next to the subscriber I don't know a more eligible *man* than the Doctor. And you must marry, so I may have you near me. My! how we could wind the dear boy around our fingers, couldn't we? Gracious! how I am raving. I started to tell you about the Centennial.

Papa, you know, is just the dearest, best, kindest-hearted and altogether lovely parent a girl could wish, so I just put my arms about his neck and said that his little girl was longing to see some friends in Philadelphia, and that TOM might, just as well as not, take me——well! you know how it is yourself. That wretched TOM again! I declare, he is corrupting me dreadfully. He had the impudence to say I was learning to talk "slang" like an angel. However, to the Centennial we went, and we had a glorious time. I haven't seen anything but the Main Building. TOM says there's lots of other interesting things to look at—which assertion I must take on trust. My dear! I tell you solemnly, and I wish you to embalm the words in rose leaves and hand them down to your children's children, the heart of woman—I mean the mind—never reveled in such exquisite sights since—well, since away back in the Silurian Period. I don't know when that was, exactly; but never mind, you know what I mean. Such laces, such coral, and oh, those dear, funny Japanese vases! I did an awful thing. I have not slept since. I was standing in front of a case of exquisite lace in the French department, admiring a flounce. Such a flounce! I shan't describe it. I presume, alas! you'll see it one day. Well, there I stood, Argus-eyed, devouring its beauty, when who should come along but that hateful FLORA FLOYD. She's perfectly made of money, you know, and seeing me admiring the flounce said to the attendant, "How much is this trifle, please?" Trifle, forsooth! "Eight hundred dollar, madame, and eet ez vera sheap."

My blood was up, and I just said, coolly, "I'll take it." TOM gazed at me in open-eyed wonder; asked, under his breath, if I felt well, and was I in the enjoyment of my usual senses? I tossed my head, gave my address to the salesman and walked on. The FLOYD could just have eaten me alive. She fairly glared at me. I couldn't have resisted this chance to take her down, if I died for it. But perhaps I wasn't considerably frightened when I reflected on what I had done! What would papa say? By-and-by I stole back softly, and took a furtive glance at the case, trying to persuade myself it was all a dream, anyhow. No, only too real! There was the flounce, twice as large as life, and on it a great horrid card, saying "Sold to Miss —— of New York." My heart went down 29° and I wanted to go home. I can't write any more. The thought of that flounce unfits me for everything, but it *is* a relief to tell somebody what a goose I have made of myself.

Write and tell me you think I was perfectly justified in acting as I did. It will reassure your distracted BLANCHE.

OUT-DOOR EXERCISE FOR MOTHERS.]

CONSIDER it your religious duty to take out-door exercise without fail each day. Sweeping and trotting around the house will not take its place; the exhilaration of the open air and change of scene are absolutely necessary. O I know all about "Lucy's gown that is not finished," and "Tommy's jacket," and even "his" coat, his buttonless coat, thrown in your lap, as it to add the last ounce to the camel's back; still I say, Up and out! Is it not more important that your children, in their tender years, should not be left motherless, and that they should not be born to that feeble constitution of body which will blight every early blessing? Let buttons and strings go; you will take hold of them with more vigor and patience when you do return bright and refreshed; and if every stitch be not finished at just such a moment (and it is discouraging not to be able to systematize in your labor, even with your best efforts), still remember that "she who hath done what she could" is entitled to no mean praise. Your husband is undoubtedly "the best of men," though there are some malicious people who might say that that is not saying much for him. Still he would never, to the end of time, dream what you were dying of; so accept my advice, and take the matter in hand yourself.

DRESSING EXPENSIVELY AT $10 A YEAR.

THEY tell an anecdote at Washington of a certain Congressman who proclaimed that a rigid system of economy must be practiced, as the various failures here, there and everywhere had dwarfed the amount of his annual income.

"But what am I to do for party dresses?" asked the anxious wife.

"Leave that matter to me, my dear, and I will arrange it to your satisfaction," soothingly replied the legislator.

Calling in a reporter, he set before him a tempting array of edibles, with wine enough to send warmth through his veins and generous throbs to his heart-strings.

"Now, my friend," said the M. C., "I want to employ you to describe my wife's dresses this winter—or rather, she will describe them, and you can insert the descriptions in your various papers. Here's $10 for your trouble, and a seat at our table when you're hungry."

The result is that Mrs. M. C. appears clothed in such gorgeousness as was only known to Solomon in all his glory; yet her wardrobe is exceedingly circumscribed.

AN OLD-TIME GIRL.

WE saw her on Fourth street yesterday. She wore a neatly-fitting, plainly-cut and modestly-trimmed calico dress. Her modest face beamed with youth and beauty beneath the graceful folds of a gauzy green veil, and her rosy cheeks shone through it like a pair of large cherries. She didn't carry one-half of her dress in her hand high up to gratify the vulgar gaze of blackguards or to draw forth ludicrous and ungentlemanly remarks of corner loafers. Nor was she pinned back so tight she couldn't step, and her heels didn't kick her tiller as high as the small of her back. She didn't walk like a mule with a loose set of harness on and flies bad. No; she wasn't dressed in a style calculated to attract the attention of any but true gentlemen, and of these she commanded the utmost respect, and it was paid her by all who, in meeting admired her.—*Courier-Journal.*

Reading for the Young.

GOOD NIGHT!

WHAT do I see in baby's eyes?
So bright! so bright!
I see the blue, I see a spark,
I see a twinkle in the dark—
Now shut them tight.

What do I see in baby's eyes?
Shut tight—shut tight.
The blue is gone, the light is hid—
I'll lay a soft kiss on each lid.
Good night! good night!

[*Mrs. Dodge, in St. Nicholas.*

ABOUT SEVERAL THINGS.

MY DEAR NIECES AND NEPHEWS:—I don't think either myself or Uncle MARK could sufficiently express the pleasure it gives us to hear from our young friends. And yet, at the same time, it is one of my greatest disappointments to begin a charming letter and after reading with increasing interest down to the last page, to learn that my young correspondent is so unfortunate as to have absolutely no name! I judge parents must be in the habit of omitting so important a ceremony as baptising their children, or the names have been such hard ones as to quite discourage the use of them by their offspring. I have recently heard of a young fellow, about 24 hours old, who will have to struggle through this life and be known as AMERICAN CENTENNIAL ADAMS. Now he will have a good excuse in suppressing all but the initials. I do seriously protest, however, that it is not fair to write letters to us, and round them off with a tantalizing JACK or MARY. I leave it to yourselves if I do not set a fair example by unblushingly printing *my* name, with the "handle" and all requisite appurtenances. Ought you to do less? Therefore, resolved, that the Rural Legion do henceforth write their full name and address on all letters for Uncle TRUE'S private satisfaction, *not* for publication. If you do not favor me in this particular, I shall consider you do not intend your letter for me, but that you have something strictly private to communicate to the waste basket and I will promptly turn it over to my capacious friend, striving not to violate private correspondence by glancing at its contents. There!

The Editor says next week he will publish some of the answers to the question about the Spider asked in RURAL of June 17, and at the same time designate who, in his opinion, has given the most comprehensive and appropriate answer. I have taken advantage of this confidence to say to you that there is but one week of grace and those wishing a very nice plant should lose no time in submitting *their* idea of what was the proper thing to have done. Last warning! Going—going—! You will all know how it has "gone!" next week.

I have been very sensibly touched by the often repeated aspiration of my neices and nephews that they might become journalists. All seem to think, though, that it would be the merest pastime for a camel to prance through the eye of a needle by comparison to the tribulations of a beginner in the field of letters. This is all wrong. We often lose the good we might attain by fearing to attempt. I well remember with what fear and trembling I contributed my first article to current literature and with what great awe I approached the big man whose name, Editor, appeared to endow him with superhuman attributes. I have since learned that the genus Editor is usually made of quite an ordinary quality of clay, not unfrequently cracked in the baking, and without the beautiful handle that adorns the article would be quite a common jug after all.

It is, however, our pleasant fortune to have a nook in the RURAL all to ourselves, and I propose with your gracious approbation and co-operation, to have a little magazine in which we shall be exclusively interested. My idea is to give the outlines of a subject which I shall expect you to work out and elaborate, using the best English at your command. I shall select and print the essay I deem the best, taking pains to point out its merits and defects, as a guide to future competitors. You can have no idea until you try, how improving to your mental faculties an exercise of this kind is. Now I trust all my bright young relations will meet me half way in this project, to the end that *our* column may be made positively the most enchanting department for young and old in the whole paper. The initial subject will be,

JOANNE OF ARC.

Most of you are familiar with the life of this brave young girl, who accomplished more and more heroically than most any woman mentioned in history. I want a brief sketch of her birth, early life, the events that led to her espousing the cause of her crownless monarch; the peril and vicissitudes of her subsequent career; how she accomplished her object; her reward; treatment at the hands of her captors; with a closing paragraph on the effect of her life and career on the moral and political fortunes of her country. I have no objections to your looking up facts, dates, etc., when your memory fails you in this regard; but I cannot tolerate for a moment anything that savors of copying. Have the language your own, and the comments must be the result of your reflections on what you may have gleaned from history. It only needs your hearty assistance to make our little scheme a brilliant success. That such it may be is the earnest wish of

UNCLE TRUE.

THE most laudable ambition is to be wise, and the greatest wisdom is to be good.

ORIGIN OF THE "HOUSE THAT JACK BUILT."

THERE is a poem at the end of the Book of Passover Services used by the Jews, says Clodd, in his "History of Religions," which some among them regard as a parable of the past and future of the Holy Land. It contains ten verses, each ending with the refrain, "A kid, a kid." After telling how a cat came and ate the kid, and a dog came and bit the cat, and a staff came and beat the dog, and so on, it concludes thus:

Then came the Holy One, blessed be he,
And killed the Angel of Death,
That killed the butcher,
That slew the ox,
That drank the water,
That quenched the fire,
That burned the staff,
That beat the dog,
That bit the cat,
That ate the kid,
That my father bought
For two pieces of money:
A kid, a kid.

LETTERS FROM BOYS AND GIRLS.

From a Bay State Girl.

DEAR EDITOR:—This is the first time I have attempted to write for a paper. I think it is the best of papers. We have taken the RURAL for five years. We take several others. I am a farmer's daughter. I live on a 75-acre farm. We keep nine cows and two horses. I can harness and drive them. I am not as smart as "WILD CRAB," to milk twelve cows. I have one sister; her name is LOTTA; she is seven years old. Our pets are three goats; we harness them in a cart and have fine drives with them. We have a cat and a dog; their names are Buff and Shef; two rabbits and two birds. I notice all the Cousins write their ages. I will write mine. I am thirteen years old. I go to school. I study Reading, Spelling, Arithmetic, Grammar, Geography, Writing and Music. I notice the Cousins do not say much about plants. I am very fond of flowers. I have quite a number of house plants. I hope to be one of the Cousins. —PANSY, *Brockton, Mass.*

From a Pennsylvania School-Girl.

MR. EDITOR:—I live on a farm four miles west of Erie City. I attend school and like it very much. Have any of the girls gotten up a Leap-year party? If they have, I would like to have them write and tell me how they prospered. We take the RURAL, and I think it is a very good paper. I look for the Boys' and Girls' Letters almost the first thing. I have not yet seen any letter from West Mill Creek, so three of my schoolmates and myself thought we would write, hoping, if accepted, to see them all in one paper. I close, wishing to be considered one of the RURAL cousins.—RILLA E. M., *West Mill Creek, Erie Co., Pa.*

The Puzzler.

CROSS-WORD ENIGMA.

MY first is in cream but not in milk,
My second is in cotton but not in silk;
My third is in dome but not in spire,
My fourth is in ream but not in quire;
My fifth is in cold but not in warm,
My sixth is in snow but not in storm;
My seventh is in rose but not in thorn,
My eighth is in wheat but not in corn;
My ninth is in month but not in week,
My tenth is in modest but not in meek;
My eleventh is not in think but in guess,
My whole is what every one should possess.

☞ Answer in two weeks. BERBIX.

HIDDEN RIVERS.

1. I COME with a merry heart my friends to greet.
2. I love to stay in the house.
3. Give me air enough to breathe.
4. It sounded like a benizon. At least, to me.
5. I cannot pull up that weed. Can you?
6. He underwent the operation. How brave!
7. I have friends in Trenton.
8. Can you eat fat ham escalloped? 'Tis fine.
9. Napoleon died at St. Helena.
10. Did you ever see a Moor?
11. My baby plays in dust and dirt.

☞ Answer in two weeks. LITTLE ONE.

DOUBLE ACROSTIC.

1. A low, dwarf tree. 2. A cap, or other head covering. 3. A domestic animal. 4. A lake in the Eastern States. 5. An Oriental city. 6. A beautiful flower. 7. A flag or banner. 8. A kind of gun. The initials give the name of an American general, and the finals that of an English general of the Revolutionary War.

☞ Answer in two weeks. ISOLA.

CROSS-WORD PUZZLE.

My first is in Harry but not in Oscar,
My second is in Claude but not in Oliver;
My third is in George but not in Samuel,
My fourth is in Horace but not in Lemuel.
My whole is a boy's name.

☞ Answer in two weeks. MD.

PUZZLER ANSWERS.—July 8.

ILLUSTRATED REBUS.—Be honest, understand your faults and nothing extenuate.

CENTRAL PUZZLE.—Winnipiscogee.

DOUBLE ACROSTIC.—Primals, John Quincy Adams; finals, Millard Fillmore.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

It is reported that native quicksilver has been discovered on the banks of the Mississippi, a few miles below New Orleans.

We have 80,000 miles of telegraph line and 74,000 miles of railroad.

The regulation American flag has thirty-eight stars now.

Oranges and pineapples are floating ashore at Long Branch, much to the delight of the summer visitors.

San Francisco complains of the immense number of unemployed clerks, salesmen and other men of that class now crowding the city, and besieging business men with their appeals for work.

We have 6,000,000 farmers, 1,200,000 trades people, 2,700,000 mechanics, 2,600,000 professional men, 43,000 clergymen, 40,000 lawyers, 126,822 teachers, 62,000 doctors, 2,000 actors, 5,200 journalists, 1,000,000 laborers and 750,000 domestic servants.

There are one hundred and sixty-two driving parks in the United States. The value of the property held by these associations is estimated at $5,000,000; and that of the horses entered in a single year at $15,000,000.

The San Antonio (Texas) Herald says the stage drivers between that city and Kingston are to be provided with umbrellas to hold over the stage robbers in case it rains, while they are robbing the mails and relieving passengers.

A Minneapolis (Minn.) woman recently found a little package that contained seventeen diamonds secreted in a desk that once belonged to her great-grandfather.

On Governor's Island there is a grave of a soldier who served his country forty years in the hope of achieving a lieutenancy, and died with his moderate ambition unappeased.

A squad of twenty policemen who had been sent to quell an anticipated violation of the peace at the new reservoir now building in Albany took refuge from a thunder-storm in a tool-shop on the 12th inst., when the building was struck by lightning and all were more or less affected, though none were fatally hurt.

The Rev. J. S. White has been fined for violating a Kentucky law which requires lecturers who charge for admission to take out licenses.

Judge Keith in Chambers, at Warrenton, Va., has appointed John S. Barbour receiver of the Virginia Midland Railroad, in the suit of Graham and others, entered at Alexandria on the 17th of June.

Mr. John Phelps, President of the National Cotton Exchange of America, in pursuance of resolution adopted by the convention last July, has issued a call for an International Cotton Exchange Convention, to meet at the Langham Hotel, London, on the 9th of August next. Nine delegates have been appointed to represent the American Cotton Exchange.

A special dispatch from Crisfield, Somerset Co., Md., dated the 11th inst., says: Yesterday morning, about six o'clock, Mr. W. C. Handy, residing on his farm near this town, was assaulted by four masked men, who forced him to open his safe, from which they took about $4,000, mostly in gold coin. They left, after gagging and binding Mr. Handy and his sister, who were the only occupants of the premises. Mr. Handy says he can identify one of the robbers. About three years ago Mr. Handy was robbed of $3,000 in a somewhat similar manner.

The employes at Castle Garden are engaged in removing the refuse created by the fire, and 25 laborers have cleared the space formerly devoted to the baggage-room. The steamship Oder brought 71 immigrants, who were cared for at the Garden over night. Mr. Jackson, the Superintendent and Treasurer, estimates the loss by the fire at between $40,000 and $50,000.

The agent at Duluth, of the line to which the propeller St. Clair belonged, gives the following as the list of the persons lost on that vessel whose bodies have been recovered: Judge Edward, Capt. Miller, and Neil Leitch of Marquette; David Lawrence and G. H. Beardsley of Ontonagon; Mr. Eaton, an explorer from Big Rapids, Mich.; L. D. Collins, S. Stewart and Alexander Shea of Duluth; Richard Shickeleton, clerk, of Detroit; two Frenchmen, firemen, belonging at Duluth, and one unrecognized passenger.

Gov. Tilden has commuted to imprisonment for life the sentence of Albert Fredenburgh, who was to have been hanged on Friday next for the murder of Orlo Davis in Gray, Herkimer Co., in June, 1875.

Ninety-nine replies from 57 counties in Georgia report the character of weather, July 1, extremely seasonable to the growing cotton crop—more so than the same period last year. No change is reported in acreage. Stands are represented as uncommonly good, the plant forming the blooming well. The condition, on the whole, is remarkably fine, and, with few exceptions, better than last year. The general tenor of the reports exhibit an unprecedently good prospect, the crop being free of grass and weeds, and the plant being vigorous. Twenty-six replies from 14 counties in Florida reports favorable weather, the stand good, and plant forming well. The prospect of a large yield is encouraging. No change is reported in acreage.

The bishops of the Colored Methodist Episcopal Church have appointed Friday, Aug. 3, as a day of fasting and prayer.

Among the participants in the parade of the Roman Catholic Total Abstinence Societies in Philadelphia on the 4th of July was a deputation of Chippewa and Menomonee Indians, who came East in charge of their missionary, Father Chebel. Their home is in Northern Wisconsin, where they have attained a considerable degree of civilization. "During their stay," says The Philadelphia Ledger, "they conducted themselves with perfect propriety, and made a very favorable impression on all who came in contact with them."

The Teachers' Convention, State of New York, met at Albany, July 14. Several interesting papers were read and discussed.

At Freedom, Pa., a small town on the Ohio River, 24 miles below Pittsburgh, a rain storm occurred, July 13, which did great damage and was destructive of human life. Crow's Run, which empties into the Ohio at this point, was swollen into a river in size and the houses along its banks were flooded. A house owned and occupied by Thomas Lighthill was swept away, and his wife and four children were drowned.

The constant rains during the past few days in Middle and Southern Ohio have caused considerable damage. A waterspout near Londonville destroyed a number of wheat fields, carried off 100 head of sheep and washed out several hundred feet of railroad track, in some places to the depth of eight feet.

To the list of 22 asteroids discovered by him, Dr. C. H. F. Peters of Litchfield Observatory (Hamilton College) adds two variable stars. These stars are called variable because they vary periodically their brightness. In a letter to The Herald, dated July 12, he says: "The first one is in 15h. 14m. of right ascension, 19° 55′ south declination, now near its maximum of brightness (between seventh and eigth magnitude the 13th inst, of a ruby color); the second one, in 16h. 1m., right ascension, 21° 10′ south declination, is fast waning, only just visible now in our telescope, but was 10th magnitude in the month of May last. The whole number of stars now recognized as variables is about 150—almost exactly the same as the number of known asteroids."

The Indianapolis Journal says that the indications are that the rainy season in that section has closed and that they will now have a period of clear and dry weather. If the supposition prove true, the crops will not have suffered very materially from the rains of the past few weeks and abundant harvests may reasonably be expected. Wheat, which in the vicinity of Indianapolis is probably all cut and shocked, may have suffered some. Corn has only suffered, if at all, by the rank growth of weeds, from the impossibility of working it. The Journal is sanguine that if the rain cease for a while this can be remedied and that there will be nothing to hinder an immense crop of this important cereal. The smaller crops all promise well, as do all kinds of fruit, except peaches. So far from there being any cause for discouragement, says the Journal, the prospects are still good for an immense and remunerative return in nearly all branches of husbandry.

Seventeen days of dry, hot weather ended in the thunder-showers of the 11th inst. The violence of the previous night's storm was fairly proportioned to the long continued drouth. The torrents of rain have fallen upon earth so parched, that in all our parks the grass seems to have been actually burned away. Perhaps the most remarkable of the features of this "heated term" is the report from localities in New Jersey of fires in the soil itself. Very probably in these cases the surface earth has been very largely composed of vegetable material, and perhaps is land rescued from previous swamps. Old residents of the city will compare this year's heat with that of former years, and doubtless pronounce it inferior to the extraordinary summers of their recollection. They will recall the three hot weeks of June and July, 1835, when men's minds were also ablaze with the fever of speculation; the hot weather at the date of the Croton celebration, which made its promises of cool water the more welcome; the dry, scorching weeks of 1846, from the latter part of June to the 9th of August; the three months of hot weather in 1856, when all the grass disappeared and there was almost a famine in feedstuffs; the summer of 1864, when for five weeks not a drop of rain fell, it is said, in the whole State of New York. Other years might be instanced of briefer but equally excessive heat; and although 1876 will go on record as among the worst in respect to sunstroke mortality, its 154 deaths in three days do not surpass the fatality of the hottest of recent summers, 1872.

It is proposed to modify the tax on tobacco.

The following is the full text of the joint resolution for the issue of silver coin, which has passed both Houses of Congress and now goes to the President for signature:

Resolved, That the Secretary of the Treasury under such limits and regulations as will best secure a just and fair distribution of the same through the country, may issue the silver coin at any time in the Treasury to an amount not exceeding $10,000,000 in exchange for an equal amount of legal-tender notes, and notes so received in exchange shall be kept as a special fund separate and apart from all other money in the Treasury, and be issued only upon the retirement and destruction of a like sum of fractional currency received at the Treasury in payment of dues to the United States, and said fractional currency, when so substituted shall be destroyed and held as part of the sinking fund, as provided in the act approved April 17, 1876.

SEC. 2. That the trade dollar shall not hereafter be a legal tender, and the Secretary of the Treasury is hereby authorized to limit from time to time the coinage thereof to such an amount as he may deem sufficient to meet the export demand for the same.

SEC. 3. That in addition to the amount of subsidiary silver coin authorized by law to be issued in redemption of the fractional currency, it shall be lawful to manufacture at the several mints, and issue through the Treasury and its several offices such coin to an amount of subsidiary silver coin and of fractional currency out standing, shall in the aggregate not exceed at any time, $50,000,000.

SEC. 4. That the silver bullion required for the purposes of this act shall be purchased from time to time at the market rate by the Secretary of the Treasury with any money in the Treasury not otherwise appropriated, but no purchase of bullion shall be made under this resolution when the market price shall be such as will not admit of the coinage and issue as herein provided without loss to the Treasury; and any gain or seigniorage arising from this coinage shall be accounted for and paid into the Treasury, as provided under existing laws relative to subsidiary coinage, provided that the amount of money at any one time invested in such silver bullion, exclusive of such resulting coin, shall not exceed $200,000.

Six companies of the Sixth Infantry, under Gen. Miles, passed through Atchison, Kansas, on their way to the Sioux country.

James L. Wilson, Treasurer of the District of Columbia, left Washington two weeks ago, and the District Commissioners have discovered by an examination of his books that he has embezzled nearly $7,000.

The trial of Munley, at Pottsville, for the murder of mining boss Sanger has closed, the jury rendering a verdict of murder in the first degree.

At Ithaca, N. Y., Theodore Deschner killed Andrew Smith for being too intimate with Mrs. Deschner. The murderer gave himself up to the police.

In Pittsburg, W. C. McDonald went to the house of his father-in-law, where his wife had been staying for some time, and after some angry words drew a revolver and shot her and himself. Both are believed to be fatally wounded.

A fire in St. Louis has destroyed the iron foundry of Shickle, Harrison & Co., and the greater portion of the nut and bolt factory of H. E. Moran & Bro. The aggregate loss is $55,000.

Three warehouses, 3,000 empty barrels and eight cars loaded with refined oil at the Cosmos Oil Refinery, near Pittsburg, were burned. Loss $25,000.

The steamer Champion was burned on Lake St. Clair. Loss $25,000

Mr. Rogers, General Sewell (the successor of Yaryan), and ex-Congressman Kellogg of Connecticut, are mentioned in connection with the succession to Mr. Pratt.

The President nominated James S. Delano of Illinois, to be Deputy Second Comptroller of the Treasury; John Kelly, Collector of Customs at Willamette, Oregon; Thomas B. Shannon, Collector at San Francisco; Charles A. Santmeyer, Appraiser of Merchandise at Cincinnati; Thomas W. Bennett, Governor of Idaho and William H. Howard, Surveyor-General for Arizona.

General Sherman and Secretary Cameron had an interview with the President in relation to the Indian war.

An unusually large number of Congressmen are ill, some of them seriously, from the effects of the heat.

Henry Watterson accepts the Congressional nomination almost unanimously offered him by the Democrats of the Louisville District. It is understood that the Republicans will nominate ex-Secretary Bristow against him.

Monroe Heath was elected Mayor of Chicago by 8,250 majority.

The Emperor and Empress of Brazil sailed for Europe in the steamship Russia.

A large meeting in aid of the Old South Church fund was held in the hall of the Merchants' Exchange, at Boston. Addresses were made by Edward Everett Hale and Wendell Phillips.

The members of the Hebrew Convention, in session at Washington, paid their respects to the President. Mr. Simon Wolf introduced them as "citizens of the United States engaged in the good cause of education—a cause in which the President was known to take great interest." The President in reply, complimented them and their convention and wished them success.

In the U. S. Senate, the House bill to amend the Pacific Railroad acts was read by title, and, after some discussion as to the propriety of referring it to the Committee on Judiciary or the Committee on Railroads, went over at the expiration of the morning hour. Mr. Hamlin presented the credentials of James G. Blaine, appointed U. S. Senator from Maine, in place of Lot M. Morrill, resigned, and they were placed on file. Mr. Thurman, from the Judiciary Committee, made a written report in reply to a resolution of the Senate of January last directing an inquiry into matters relating to the Pacific Railroads. The report was accompanied by a bill to amend the Pacific Railroad acts. The bill was placed on the calendar and the report ordered to be printed. Mr. Logan moved to take up the House bill for the equalization of bounties, so that it would be the unfinished business for the next morning hour, but the Chair decided that it could not so come up, but must be taken up by a vote each day. Mr. Logan then moved to make the bill a special order, but objection was made by several Senators. The joint resolution authorizing the President to accept the services of volunteers against the Indians, was referred to the Committee on Military Affairs. The Senate then went into session as a Court of Impeachment. When legislative business was resumed, the Post Route bill was taken up and made the unfinished business for the next day. Mr. Windom, from the Committee on Appropriations, reported the bill providing for the construction of the Washington Monument, and it was placed on the calendar.

In the House a resolution in the Louisiana contested case, reported by the Committee on Elections, was adopted, declaring Mr. Darrall, the sitting member, entitled to his seat. The bill for the sale of Fort Kearney reservation in Nebraska was passed. Mr. Hoskins of New York introduced a bill to prevent the overloading of vessels carrying freight and passengers. The bill opening the Black Hills country to settlement was recommitted. Mr. Thornburgh, from the Appropriation Committee, reported a bill appropriating $200,000 for the establishment of military posts on the Mussel Shell and Yellowstone rivers, and it was passed. The bill regulating promotions of commodores on the retired list of the Navy was also passed. Mr. Hewitt of New York, from the Committee on Foreign Affairs, reported back the resolution censuring Gen. Schenck for his connection with the Emma Mine business while Minister to England. It was adopted without a division. The Speaker presented a communication from the Argentine Congress, congratulating the Congress of the United States on the Centennial Anniversary of American Independence. The bill for the protection of the Rio Grande was debated in Committee of the Whole. The Senate amendment to the bill in relation to leave of absence of army officers was concurred in.

The conference committee on the Sundry Civil bill have settled all but twenty-one of the points of difference. There were 214 points on which the Senate and House disagreed.

The Senate confirmed James N. Tyner as Postmaster-General, to succeed Mr. Jewell.

The destruction of Castle Garden has caused the narration of many reminiscences of the ancient building and of old New York. Originally built in conjunction with a battery by the Dutch settlers as a work of defence against the British and other foes, it was captured by the British and was given the name of Fort James. The Dutch having regained possession of it, the structure was named Fort William Hendrick. Upon the dethronement of the Stuart dynasty by the English, the residents of the embryo metropolis seized the fort, and for two years it was an object of interest in the war which agitated the people here and abroad. Gov. Fletcher made the fort the headquarters of the desperate men who preyed on the commerce of the New World. Bellamont's rule later redeemed it from the odium of the Fletcher administration. When John Montgomery became Governor, the fort took the name of Fort Clinton. Governors and officials occupied it, until during the Revolution it was used by Lord Howe, the commander of the British forces. After the Revolution it was hoped that New York would be the seat of the Presidential mansion, and with the purpose of erecting a structure worthy of the new nation, the old Governor's mansion at the fort was destroyed. The hopes of those interested in the subject were frustrated, however, as the national capital was placed in the District of Columbia. The stockades, outer defences, etc., were leveled, and the Castle became a fortification merely in name.

The Consul-General of Italy has sent to the Treasury Department, on behalf of the Italian Society for salvage, $408 in gold, to be distributed to the families of the life saving crew on Curri-

tuck Beach, North Carolina, who lost their lives in March last while attempting to save the crew of the Italian bark Nuova Ottavia.

The citizens of Monroe, Mich., (Gen. Custer's native city,) have taken steps toward erecting a magnificent monument to the memory of that brave officer and his comrades.

The Central and Pennsylvania roads have notified the Postmaster-General that the Fast Mail Train will be discontinued unless the remuneration is increased.

The 21st annual Convention of the Young Men's Christian Associations of the United States and Canada met in Toronto. About 500 delegates were present.

FOREIGN NOTES.

The Spanish Government is trying to raise money by giving the customs receipts of Cuba as security. Forty million dollars are needed, and it is expected that Cuba will yield one-fifth of that sum, while the remainder will be subscribed in Spain. The Havana merchants have made up $3,000,000. The planters are to meet and see what they can do. The scheme is considered a forced loan, and is rendered necessary by the desperate state of the Cuban finances.

The Servian prospects are improving. Advices from Belgrade state that the Turks have withdrawn from the right bank of the Drina, with the view of defending Novi-Bazar, which is threatened by General Zack. The heroic defense of Saltschar has been succeeded by the retreat of the Turks to Widdin, where they have been followed by the Servian skirmishers, who have occupied several villages, the people having flocked to their standard. Attention is, however, concentrated mainly on the Servian army, which is advancing on the Turkish forces at Nissa. It is reported in Paris that the General is hemmed in by the Turks but this is very improbable.

Sidney Smith made an eloquent plea against locking passengers into railway cars in 1842—thirty-four years ago—and still the locking-in evil continues, and the English cars are more crowded and uncomfortable than ever.

Official dispatches announce that the Turks have withdrawn from the right bank of the river Drina. The Servian army of the Timok has occupied several villages, and reconnoitered the country to Widdin, to which place the Turks have retreated. The population of the district have risen and joined the Morava division of the Servian army.

The Servians under Gen. Benifan fought a superior force of Turks seven hours on the 7th inst. at Kruschevas. The Turkish loss was considerable. The Servians lost slightly, captured some flags, a quantity of arms, and occupied several villages.

The English ironclad "Thunderer," one of the most formidable in the Navy, exploded a boiler. The following is the latest from Portsmouth in regard to the disaster:—Twenty-five of the crew are dead. The bodies are shockingly mutilated, the flesh being stripped from the limbs by the escaping steam. The forward stokehole, where the explosion occurred, is divided from the after stokehole by water-tight bulk-heads. The stokers in the latter were protected from the fragments caused by the explosion, but were literally boiled alive by the steam.

The following telegrams will give an idea of the Turkish situation up to the time of writing:

From Semlin:—"The Servian Gen. Tchernayeff is near Nisch. The Turkish Gen. Abdul Kerim has made Widdin his base of operations and threatens Gen. Tchernayeff's rear. The latter's headquarters have been moved back to Agodina."

From Constantinople:—"The Visehigrad Division in Bosnia crossed the Servian frontier yesterday and routed the Servians near the town of Xonterdeman, which was captured and burned."

From Ragusa:—"The insurgent Gen. Peko Paulovitch defeated the Turks near Klek. The Turks lost 150 killed and 15 taken prisoners. The insurgent loss was small."

From Belgrade:—"The Servian Gen. Leschjanin energetically renewed the attack upon Osman Pasha, compelling him to abandon his intrenched positions before Saltschar."

From London:—"Earl Derby received a deputation on the Eastern question, consisting of 40 members of Parliament and 571 gentlemen from all parts of the kingdom. The Right Hon. John Bright presented a memorial in favor of strict neutrality except where it may be possible to interpose friendly offices to mitigate the horrors and to hasten the close of the conflict."

The Turks attacked the Servian camp at Sohtchanitcha, near Novi Bazar. The Servians were defeated and fled.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 15, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	84,372	Molasses	—
Whisky	1,639	Rice, bbls	352
Corn meal bbls	5,500	Cut meats, pkgs	7,903
Corn meal, bags	350	Lard, pkgs	4,210
Wheat, bush	1,185,390	Tobacco, hhds	1,732
Corn, bush	1,081,504	do. cases	3,400
Oats, bush	500,500	Butter, pkgs	21,107
Rye, bush	59,300	Cheese, bxs	91,262
Malt, bush	25,180	Cotton, bales	7,760
Barley, bush	9,000	Rosin	10,700
Beans, bbls	2,312	Suts, turn., bbls	2,281
Grass seed, bush	764	Dried Fruits, pkgs	13
Beef, pkgs	2,936	Eggs, bbls	7,462
Wool, bales	1,020	Peanuts, bags	309
Hops, bales	212	Leather, sides	60,647
Pork, bbls	357	Sugar, hhds	—
Tallow	1,338	Oil cake	9,603

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible: mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week 1052 bbls.; since Jan. 1st, 36,036 do.; same time last year, 17,239 do. Exports of peas past week, 1,474; since Jan. 1st, 426,980 bush.; same time last year, 221,041 do. The low prices for prime mediums and marrows have brought out a few speculative buyers, but there is no real demand that tends to work down the liberal supply. Mediums when very firm at the low price. Marrows still quoted at the late decline. Pea Beans are scarce. The prolonged hot weather has hurt a good deal of stock. Canadian peas are quiet. Green peas have dropped further. Red kidney beans are fairly active. We quote:

Beans—Prime pea, $1.25@1.30; fair to good, $1.00@$1.10; prime mediums, 90@95c.; fair to good, 70@80c.; poor, 40@50c.; prime marrows, $1.30@1.35; fair to good, $1.10@1 20; prime white kid., $1.20@1.30; other, $1.00@1 10; prime red kidney, $1 30@1.40; other, $1.15@1.25; Lima (Cal.), $2.75@3, Black beans, $3.75@4. Peas—Canadian, $1.18@1.20; do. in bulk and bond, 95@98c.; green, $1.00@1.10; Southern B. E., 2-bush. bag, $2.65@2.70; split, ₱ bbl., $6.

BEESWAX.—The deliveries at this market are somewhat larger, and prices are easier. Sales at 33@34c. for Western and Southern. Exports since Jan. 1st, 38,350 lbs.; same time last year, 12,318 do.

BROOM CORN.—Is neglected and about nominal. Brush, short green, 8½@10c.; hurl, green, 8½@10c.; medium, green, 5@6½c.; red and red tipped, 3@4c.

BUTTER.—A summer month is generally a dull one, but this season has been attended with such an almost unprecedented spell of hot weather that sellers could hardly do business if a demand existed. It is impossible to show stock at any advantage and the buyer has to have the assurance that the packages will "cool off" right, even in the moderate purchases they are making. Strictly fine State butter is not plenty as shipments have been restricted owing to unfavorable weather. Western butter arrives sparingly, but there is enough here to establish a low rate. Exporters are using low quantities. We repeat quotations under grades mostly nominal.

We quote:—Choice pails, 24@25c.; prime, 23@24c.; poor to good, 18@22c.; creamery pails, choice, 26@27c.; good, 24@25c.; sweet cream pails, 20@24c. State firkins, choice, 24@25c.; fair to good, 21@22c.; do. half firkin tubs, choice, 23@24c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 23@24c.; other, 18@21c.; Western creamery, choice, 23@25c.; other, 21@22c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 18@19c.; other, 12@14c.; factory choice, 16@17c.; other, 11@14c.

CHEESE.—This has been a slow week in this market. Liverpool fell off early in the week, with pretty full arrivals there. This discouraged shippers, and they were operating only as decided bargains were available. Further depression resulted on the liberal arrivals towards the close. Some sales of strictly fancy were made at 10½c., but 10¼c. at the close is a full rate, and transactions at 10c. Anything off from fine is at low figures relatively, and especially difficult to sell.

New at 10@10½c. for fine factory; 9@9½c. for good; 8@9c. for fair; do., half skimmed, 5@7c.; do., skimmed, 3@5c. State farm dairy, 10@9½c.; good to prime, 7½@8½c.; fair to good, 6½@7½c.; poor lots at 5@6c.; Western factory, good and prime, 7@8c.; fair lots, 6@7c.; do. cheddar, choice, 8¾@9c.; do. flat, choice, 8½@8¾c. Exports past week, 89,134 boxes.

COTTON.—Export demand has been very slow and prices easier.

July, 11 11-16c.; August, 11 11-16c.; September, 11 7-16@11 15-32c.; October, 11 9-32@11 5-16c.; November 11 5-16@11 7-32c.; December, 11 7-32c.; January, 11 11-32@11¾c.; February, 11¾@11 17-32c.; March, 11 21-32@11 25-32c.; April, 11 13-16@11 27-32c.; May, 11 31-32@12c.; June, 12⅛@12 5-32c.

Quotations for spot cotton, based on American standard of classification:

DRIED FRUITS.—There has been a light inquiry from the West this week for apples at outside prices; beyond this, there is nothing doing and appended prices must be regarded nominal.

Apples—State, sliced, 8@8½c.; do., quarters, 7½@8c.; Southern sliced, 9@9½c. for prime; Blackberries, 8½c. Peeled peaches, good and prime Georgia, 10@12c.; do. fancy, 13c. Unpeeled peaches, new, 10@11½c. for halves and 9@9½c. for quarters. Plums, 12@13c. Raspberries, 23@24c. Cherries, 15@16c.

EGGS.—The market has ruled weak and prices are falling. The weather was never more severe upon stock and in the anxiety of sellers to close out quotations have been quite irregular. Losses in count have been very large during the past few days and the best marks have lost the confidence of buyers. We quote, loss off:

Near points, 17½@18c.; State and Penn., 16½@17c.; Western, prime, 14½@15c.; do. other, 13c.; Canadian, 15½c.

ESSENTIAL OILS.—Oil Peppermint, in glass, $3.75 ₱ lb.; in tin, $3.25. Spearmint, in glass, $3.50; in tin, $3. Wintergreen, $3. Sassafras 35c.

FEATHERS.—Nominal. We quote prime live Western geese, 52@55c.; mixed do., 35@45c.

FLOUR.—The market has never been, probably, in worse shape than during the past week. While receipts were running liberal, demand was very light and the long spell of warm weather leading to fear of stock spoiling led to a pressure to sell, which sent prices down daily sharply. On the low grades exceptionally low prices were accepted.

For poor to very choice superfine State, $3@3.50; $4.25@4.75 for very common to fair extra do.; $4.80@4.90 for good extra do.; $4.95@5.10 for fancy do., and $5.15@5 50 for very choice extra; $3.00@3.90 for superfine Michigan, Indiana, Iowa, &c.; $4.00@4.75 for shipping extra do., the inside price for inferior, and $4.80@5.25 for choice to very fancy extra do.; good to choice white wheat extras at $5.30@6.50; fancy do. $6.55@7.50; winter wheat, good to choice family city mill extras, $7.25@8.50; round-hoop Ohio, $4.40@4.80, and trade brands of do. at $4.25@6.75; St. Louis, $4.30@6.00 for common to fair extra, and $6.05@8.50 for good to very choice; Minnesota "straight" at $5.00@5.75, and patent at $5.50@8.75; unsound stock at from $2.50@5.10; No. 2 at $2.10@2.75; city mill at $4.80@6.15. Southern at $4.05@5.00 for common to good extra, $5.05@5.75 for good to choice; $5.80@8 for common to choice family extra; $8.05@8.50 for choice to fancy new process, extra, the latter an extreme. Rye at $4.70@5.15. Corn meal, $2.00@3.00 for yellow Western, Pennsylvania and Jersey $3.35@3.35 for Brandywine.

FRESH FRUITS.—Fresh fruit is in good variety if not good in quality. Unwholesome stock is destroyed by the Sanitary police. Prime Norfolk apples have a demand and prices are better with improved quality. Early pears are slow of sale. Currants are in large supply. Raspberries are low, as most of the crop is dwarfed by dry weather. California apricots are offering with a few plums. The former are insipid and the latter too green. Blackberries are abundant and fine. Low prices use up a good many. Watermelons selling better. Of cherries only a few sour remain. Peanuts are in better demand.

Norfolk apples, green, ₱ bbl., $2@4; Red A.'s, $5@6. Wilson blackberries, quart, 12@14c. Dorchester do., 6@8c. Common do., 3@5c. Whortleberries, bush., $3@4. Raspberries, Antwerp, 3da, 4@5c.; do. Brandywine, 3@4c. Currants, small, 3c.; do. cherry, 5@7c.; black, 9c. Watermelon, $20@35 per 100. Hothouse grapes, lb., 75c.@$1 for Black Hamburg. Peanuts—Virginia, bush., $1.50@1.80; Wilmington, $1.50@1.80; Tennessee, $1@1.20. Southern peaches, crate, $2@3. Sugar pears, ₱ bbl., $1@3.

GRAIN.—This week has shown an unusually depressed feeling in the wheat market, supplies of which were large. Foreign advices discouraging, and, in consequence, but little doing, while with the very warm weather injuring stock, there was a pressure to sell, which sent prices down to 2@3c. daily, and for soft grades, on two days, there was a decline of fully 10c. Latest sales for No. 3 Chicago spring, 88@90c.; No. 3 Milwaukee spring, 90@91; No. 2 Chicago $1.03@1.04; No. 2 Milwaukee spring, $1.05@1.10; ungraded spring at 98c.@$1.25; No. 1 spring at $1.13@1.20; inferior to fair winter red Western at 70c.@1 05; No. 3 Northwest at 90c. Rye at 60@70c. for Western; 70@80c. for State. Corn is lower; sales at 42½c. for hot mixed Western; 48@52c. for unsound do.; 54½c. for low mixed; mixed, 52@52¾c.; N. Y. steamer, 52@52½c.; N. Y. No. 1, 55@56c.; N. Y. yellow, 56c.; steamer yellow, 55c.; ungraded mixed, 53@56½c.; choice Kansas mixed, 56½c. Oats are in large supply and lower; latest sales at 32@40c. for mixed Western and State; 32@35c. for white do.; 25c. for New York rejected; N. Y. No. 2, 33½c.; N. Y. No. 2 white, 32@34c.; N. Y. No. 1, 38c.; mixed Western, 31¾@38½c.; white State, 40@41c.; No. 2 Milwaukee, 38½c.

HAY AND STRAW.—Supplies are liberal and prices easy.

Baled hay is quoted:—Shipping, 65@70c.; retail qualities 80@95c.; clover, 50@65c.; salt, 60@65c. Straw is quoted at $1.10@1.15 for long rye; 75@80c. for short rye; 60@65c. for oat.

Exports past week, 687 bales; since Jan. 1st, 30,610 do.; same time last year, 25,644.

HIGHWINES.—Quoted at $1.13@1.13½

HOPS.—There has been very little doing this week. A lot of 300 bales has been shipped to London, but beyond this no export movement. Brewers do not seem to be short of supplies notwithstanding their increased trade over the very warm days latterly. Prices generally are quite steady. The crop accounts from nearly all sections here are very encouraging, while from the other side they are poor and unless there is a change for the better abroad, we are likely to be called upon again this season liberally. The quotations are:

N. Y. State, 10@17c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c., ₱ lb.

MILK.—The farmers' settlement price for June was 2½@2¾c. Supplies have been moderate from near points, but abundant from points on the Erie road. The weather has been good for milk use, but prices are feeble. Cans of 40 quarts not often exceeding $3.

POULTRY AND GAME.—Live poultry is scarce and bringing good prices. At one time during the week prime fowls brought 20c. We quote dressed fowls, 16@20c. Spring chickens, 26@30c. Turkeys, 14@18c. Fowls, N. J., ₱ lb 17@18c.; do. Western, 17@—c. Roosters, 9@10c.; Turkeys, N. J. 13@16c.; do. Western, 13@15c.; Ducks, N. J., pair, 75c.@1; do. Western 60@70c.; Geese, N. J., $1.75@2 50; do. Western, 60@70c. Spring chickens—Western, 22@24c.; do. N. J. 24@25c.

PROVISIONS.—This has been a poor week as regards amount of trade in this market, and easy prices have prevailed. Mess pork quoted at $20.15 for spot lots; $20.10 for August and $20.25 for September. Bacon at 11¾@10¾c. for long clear. Western steam lard at $11.15 for spot lots; $11.20 for August $11.30 for September and $11.42½ for October. Western stearine at 13½c. for prime. Beef hams at $22@21. Beef at $10@11 for plain mess; $12 for extra mess, and $13 for packet. Tierced quoted nominal for prime mess, and India mess. City extra, India mess at $19

SUGAR.—Refined is much high[er] with a fair trade. Raw is firmish [at] soft yellow 9¾@10¾c.; soft white [at] 11@11⅛ at 11⅜.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.25@1.30; Western, $5; Seneca root, 75c. Cider, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1. lamb skins, 50@65c.; green hides, 5½@6c.

TOBACCO.—Supplies run liberal and demand slow, but prices are not changed.

VEGETABLES.—New potatoes are in active demand for good stock. Norfolk raised are losing badly on steamer, owing to the hot weather. L. I. are not running extra large this dry term. Near points garden stuff is crowding out Southern, particularly in tomatoes. We quote:

Potatoes—Norfolk, $2.50@3 ₱ bbl.; L. I., $3@3.75. Green corn, ₱ 100, 50c.@$1. Charleston tomatoes, ₱ crate, 75c.; Norfolk, $1@1.25; N. J., $2.50@3. Marrow squash, ₱ bbl., $1.25@1 50; yellow crook, $1.75@2. string beans, ₱ bag, $1.50@1.75. Norfolk cucumbers, ₱ bbl., $1.50@3; Long Island, ₱ 100, $1.50@2. Long Island cabbage, ₱ 100, $10@3. Cauliflower, ₱ bbl., 50c.@$1. Southern potato onions, $1.50@3; white, $2.50@2.75.

WOOL.—The auction sales of woolen goods have given a little tone to the market manufacturing figuring on larger lots and more of a disposition to operate generally. Prices are now quite firmly held.

ROCHESTER, July 15.—Flour market dull; spring, $6.50; amber winter, $6.75; white winter, $7.00; double extra, $7.25. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.10@1.20; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@38c. Corn quiet at 58@62c. Corn meal, $1.50@1.75. Butter, 19@21c. Cheese, 11@13c. Eggs, 13@14c. Lard, 11@12½c. Apples, bu., $1@1.75. Potatoes, bu., 80c.@$1. Beans, ₱ bu., 50@90c. Mess pork, $20.50. Wool, 20@30c. Hay, $8@13. Straw, $6@8. Timothy seed, $2.90@3.; clover, $8.50@10. Mill feed dull at $12 for shorts, $11 for shipstuffs, and $17 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 32c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., July 15, 1876.

THE light delivery of cheese last week had the effect of throwing an unusual quantity on the market this week. The offerings from factories have been the largest of any time during the season, amounting in the aggregate to upward of 13,000 boxes, the larger part of which changed hands. The market was dull, the excessive hot weather operating in part to depress prices. Sales ranged on factory from 9¾ to 10c.; the bulk going at 10c. It was reported that a few lots of fancy reached 10½c., but buyers claimed that 10c. was top price. About 500 boxes of farm dairy cheese were on delivery, the range of prices being from 8½c. to 10c., according to quality.

The hot weather tells on the delivery of butter, which has been quite light this week. Farm dairy butter in Welch tubs brought from 20c. to 22c., and creamery in return pails sold for 23c. The frequent rains keep up the supply of fresh feed in pastures, and cows are making good returns.

We have advices from abroad for the fourth week in June. Our London correspondent reports that fine old English cheese is scarce and wanted. Fine new American sells as landed, the last week's shipments all going at 58s. The finest to arrive can now be bought at 56s., which is a lower price than at any time last season. Prices are quoted as follows: New American, extra fine, 56@58s.; fine, 52@54s.; good, 40@50s.; low grades now in market. English Cheddar sells for 86@96s.; Wiltshire double, new, 46@48s.; Cheshire medium, 46@54s.; fine, 72@86s.; Scotch, 50@60s. Dutch cheese now in market.

The favorable weather for the home make of butter tells on the market. Continental butter is slow at quotation, but in the substitutes for butter the supply is not equal to the demand. The quotations are as follows: Corks, 110s.; Dorsets, 136s.; Jersey, 100@110s.; Danish and Swedish, 100@120s.; Normandy, 152s. No American or Canadian in market. Oleomargarine, or artificial butter, brings from 60s. to 94s. per cwt.

LIVE STOCK MARKETS.

NEW YORK, July 15, 1876.

RECEIPTS OF LIVE STOCK.

" last week	8,463	21	2,187	25,316	22,733

BEEVES.—There was a slight improvement in trade in horned cattle on Monday last; no actual advance in prices could be reported, however, though the tone of the market was better and it closed quite steady. Prices ranged at 8½@9c. ₱ lb.; weights, 6@9 cwt. Wednesday, trade slow but firm at 9@10¾c; weights, 6@8 cwt., strong. Thursday, trade unusual, small; prices were 8¾@9c; weights, 6¾@8¾c. The markets closed weak on Friday at 8¾@10¾c.; weights, 5¾@8¼c. From 85 to 87 lbs., net., have been allowed. General sales at 56 lbs. net. Spanish herds sold at 8@9¼c. Native steers sold at 8¾@10c.; grade, do., 10@11c.; selected lots at retail, 11¾c. Mixed herds sold at 9@9¼c. Bulls, live weight, 3¾@4¼c.

MILCH COWS.—No improvement in the quality of animals on hand, and as a consequence no advance in rates, which ranged, on a moderate run, at $52@75 ₱ head; general sales at $50@65. Nine cows sold at $40@70 ₱ head; 15 at $15@60; 9 at $32@50; 3 at $35—calves always included.

SHEEP AND LAMBS.—Trade extremely slow in sheep and moderately active in lambs. Sheep sold at 1¾@6c. ₱ lb., on Monday last, some lambs sold at 6¾@10c. ₱ lb. Wednesday, sheep, 4½@5¾c.; lambs, 6¾@9c. Thursday, trade slow, sheep, 5¾@5¾c.; lambs, 6¾@9¾c. Friday, the markets closed slow; sheep, 4@5¾c.; lambs, 5¾@8¼c. The quality of the flocks, as above quoted, has been from common to good, only a small number of poor lambs come to hand. State sheep, 4¾@5c.; Kentucky, 4¾@5¾c.; Ohio, 4¾@5¾c.; Indiana, 5@5¾c. State lambs sold at 6¾@7¾c.; Maryland, 10c.; Kentucky, 8@9c.; Jersey, 8¾@9½c.; Virginia, 7½@10c.

HOGS.—There have been no live hogs on sale since our last weekly report. City dressed have been more free of sale at advanced rates. Heavy hogs sold at 8¾@8¾c. ₱ lb., light. Market pigs at 9c.

HORSE MARKET.—City trade easier at current rates. Forty-two head, poor quality, light harness horses sold at $40@72 ₱ head; 20 head do. at $40@95 ₱ head; 13 ordinary quality, do., sold at $115@160 ₱ head; 3 pairs stylish carriage horses sold at $500@700@1,350 ₱ pair, 2 pairs belonged; 10 head roadsters, with fair trotting action, $270@340 ₱ head; 7 pairs family carriage horses sold at $300@500 ₱ pair; 5 head, same quality, for single harness, $200@300 ₱ head; 5 saddle horses, quality poor, sold for $110@200 ₱ head.

SPECIAL NOTICES.

DEAFNESS RELIEVED.—No medicine; book free. G. [illegible] Wood, Madison, Ind.

SPILKINS says that when the crisis comes in Herzegovina, he hopes the Karageorgovitches, the Bescovitches, and all the other itches will be ready to come up to the scratch.

IT will cost you only three or four hundred dollars to go to Wagner's four-days' opera after you get to London or Paris. The opera begins Sunday, and ends Wednesday night.

AFTER years of solitary confinement, the art treasures of the late A. T. Stewart are attainable to the public. Mrs. Stewart has lent seven of the finest paintings for an exhibition in New York.

CHERRIES are green enough now to pick, and the small boy will soon be going around with his hands clasped across his equator, looking as if he didn't care how soon the Republic went to pieces.

DOM PEDRO has become so attached to Mr. Hazleton, the railroad conductor who has accompanied him in his journey through this country, that he intends to secure his services for a tour in Europe.

WARM weather, unripe cherries and political perplexities impose such burdens upon human patience that it is very rare now for a man who goes down on an orange peel to get up and hurrah for his Creator.

COL. J. H. RION of Winnsborough, S. C., has in his possession the diploma of John C. Calhoun as LL. D., issued by Yale College, Sept. 10, 1822, signed by Jeremiah Day, President and Elisha Goodrich, Secretary.

CAPTAIN EADS, the jetty engineer, has terrified the New Orleans contractors. His new channel for the Mississippi is a success, and their dredges will soon be left several miles out in the country by the changing stream.

PEOPLE who go to sleep on housetops this warm weather, would greatly oblige if they would roll off before midnight, as the performance at a later hour renders it almost impossible for the reporters of the morning papers to gather reliable details.

SAYS the New York Mail, "The heaviest of the heavy Boston swells at Swampscott weareth a white linen suit and white straw hat, which hath a blue ribbon band. He looketh at the wave through one eyeglass and remarketh, 'Boofull, by Jove!'"

EVERY person in France consumes on an average daily five lucifer matches, so that 4,600,000,000 matches are consumed monthly by the entire population. It would be curious to know how many this nation of smokers consumes in the same period.

NO one has a right to charge Americans with being lazy. Some one advertises in a St. Louis paper that he will labor at any work for a dollar per day, wait six months for pay, and then collect the money so gently that no hard feelings will be engendered.

NOW is the time for lovers to get spooney over ice-cream, she taking a few pretty dabs at his vanilla and he borrowing a taste of her chocolate. This process inspires confidence in the day when they will be throwing corn beef and cabbage across the table.

A FEW weeks since a Chicago drummer saw a young lady plowing a field in Macoupin, Ill. He stopped to ask, "When do you begin cradling?" "Not until the heads are better filled than yours," was the sententious reply. The young man passed musingly on.

MISS ANNA DICKINSON has completed her new play. It is written in five acts, and each illustrates the fortunes and persecutions of a Jewess in a different country—England, France, Germany, Russia and the United States. Miss Dickinson will play the Jewess.

THE poor, untutored savage respected a dead newspaper correspondent in the Custer massacre, and left him as he fell, clothed and unmutilated; but, for all that, doubtless no newspaper correspondent will care to be assigned to the front in the Indian country at present.

EMMA W. HYLAND, a young girl of Lowell, Mass., stimulated by the offer of a prize made by a weekly newspaper, has succeeded in writing ten thousand two hundred and eighty-seven words on a postal card. The reward will scarcely pay for the injury done to her eyes.

"I NEVER can enjoy poetry when I'm cookin'" said an old lady who dropped in on us recently. "But when I step out to feed the hogs and hist myself onto the fence, and throw my soul into a few lines of 'Capt'n Jenks,' it does seem as if this airth was made to live on after all."

THEY have at least one cheerful volume in the prison library at Mazas and several other French prisons. A "Suicide's Album" is kept, which is constantly open to the inspection of the prisoners. It depicts in the most vivid manner the agonies of those who have attempted or committed suicide to defeat the ends of justice.

AT one time Daniel Webster had a difficult case to plead, and a verdict was returned against his client. One of the witnesses came to him and said, "Mr. Webster, if I had thought we should have lost the case, I might have testified a good deal more than I did." "It is of no consequence," replied the lawyer; "the jury did not believe a word you said."

ONCE upon a time, the Dean of Westminster, going to the Abbey, put his gloves into his hat. On returning home after his discourse he said to his wife, "Somehow the congregation seemed to gaze upon me to-day with a peculiar interest while I was preaching." "I do not wonder," replied Lady Stanley, "for during your entire sermon your gloves rested on the top of your head."

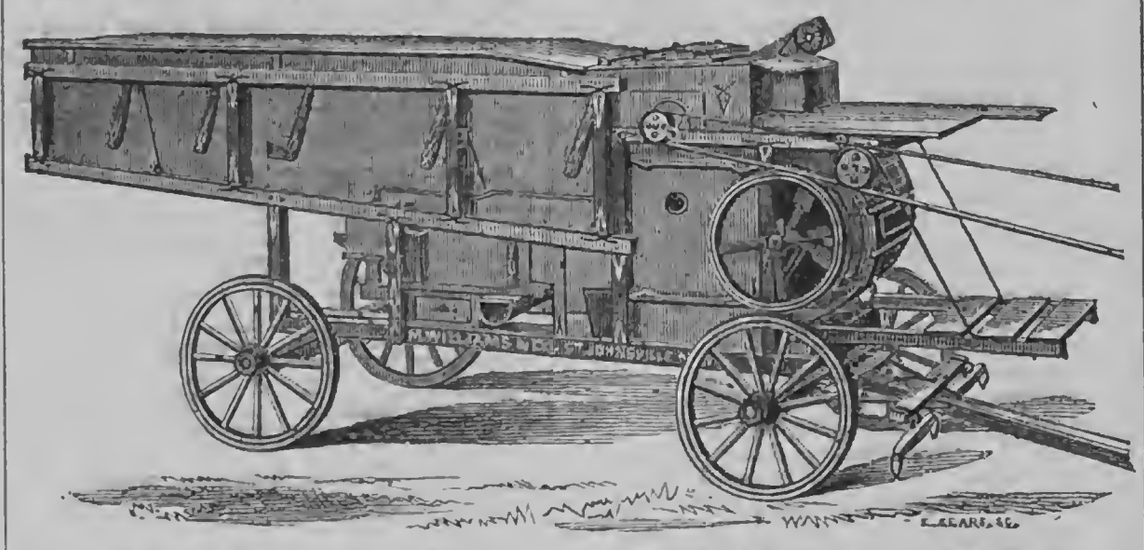
THE Duke de Morny received an application for employment from a young man who came well recommended. "I do not know how to find you a place; my household is full." "Your Grace," said the young man, nervously fingering his hat, "I sadly need work." "Well, suppose I make you my hair-dresser?" The applicant colored, and replied indignantly, "I do not seek a sinecure."

THE latest story of a brave though child-like form, faithful at the post of duty, comes from Ohio. He was the son of a village editor, and, having discovered a broken rail just outside of the town, sat for five hours on a fence near by waiting for the train, so that he might be the first to carry the particulars of the accident to his father! Such devotion to the parental interest is very affecting.

"NOT approving the cost and unnecessary display ordinarily attending funerals," wrote Gibson Young, editor of the Ballston (N. Y.) Democrat, just before his death, "I desire to be placed in a chestnut coffin, oiled, but not painted. This is to be enclosed in a white pine or black walnut box. I hope none of my family will wear mourning—a useless expense and a miserable fashion. Above all things, see that every measure be resorted to proving that I am *dead*, DEAD, before placed in a coffin."

Implements and Machinery.

Williams' Noiseless Thresher



For Light Running, Easy Management, Simplicity, Durability, and the greatest amount of grain Threshed and Cleaned in the shortest time without waste, stands unequaled by any Threshing Machine in the world. Warranted as represented, or may be returned to us at *our expense*.

$1,000 Challenge $1,000

Wilbur's Direct Draft Mower is the lightest draft Mower in the world. Will cut more grass than any side draft Mower. Leaves grass in better position to cure. Enables the farmer to make a better quality of hay—is the most economical Mower the farmer can use. The Eureka shows a new *departure*—a new principle. It shows many points of superiority over side-cut machines. We challenge side-cut machine manufacturers to mow 50 acres with us, in competition, on the above points, for $1,000.

ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

ANSWERS TO CORRESPONDENTS.

B., Brookline.—All plants contain lime. If your soil is destitute of it, a liberal application will prove of benefit.

Liebig's view that its chief effect is that due to its liberating soda and potash, is not questioned to-day. We advise you to use a bushel of quick-lime upon the bed twenty feet diameter, which you say has been heavily manured every spring with stable manure for the past six years—and yet does not seem suited to many plants. We presume too much manure has been used and that the soil has become soggy. The quick-lime will "sweeten" it. If naturally clayey, sand, also, may be added with the lime.

H. C., Norwich, Ontario.—No. 1, which you have marked: "Hardy shrub, growing four or five feet high," is *Spiræa sorbifolia*. No. 2, marked: "Hardy Perennial, grows twelve to fifteen inches high," is a hardy *Gladiolus*. You will find the underground stem a small corm. No. 3, which you have marked: "Hardy perennial, grows four or five feet high," we cannot determine. The flowers are so small that, as they are pressed quite flat, the essential parts cannot be made out. We fancy it is an umbelliferous plant, and might determine the genus and species if we had the fruit. Please send another specimen, in moist cotton, with leaf and fruit.

C., Detroit.—Some leave Tulips in the ground for several years undisturbed—others take them up as soon as the foliage dies in the summer (usually middle of June), separate the bulbs, place them in cool, dry places and replant in the fall. The young bulbs, in this way, have a chance of growing faster than when crowded together in the soil. Our own preference, however, is to take them up, separate and replant at once, since a little neglect, or a room too close or warm, will, before we know it, cause sprouting and decay.

It is not sufficiently borne in mind that bulbs are weakened just in the proportion that they sprout, and that the sprout itself is only a part of the vitality of the bulb, since having no roots and being out of their element, there is no other source of nutriment.

2. The early-flowering Tulips bloom ten days before the late sorts, and are very desirable in a Tulip-bed, though the late sorts are more prized for the beauty and diversity of their markings.

3. If the former be planted in earth, moss or water, in early September, they will bloom in December. For a succession of bloom during winter, plant every week.

Young Miner.—The laws governing the locating of mines is somewhat variable, or in other words, not the same in all the States and Territories. The Act of Congress, in 1872, fixes the limit of the length of a mining claim to 1,500 feet—the width being fixed by local authorities. In some of the mining regions, 50 feet on each side of the vein is allowed—on others 150, or 300 by 1,500 feet is the size of a claim. After a claim is made on the lode, located and staked out, the claimant is required to do $100 worth of work upon it annually, in order to hold or keep his title good, according to law.

Young Housekeeper.—You need have no fears about being poisoned, or injured in the least, by using water passing through lead pipe. If the water should be used after being confined days or weeks in the pipe, it would not be as pure and healthy; but water passing through lead pipe once, even if the pipe was a half mile long, would not be poisoned. Ordinary spring or well water, passing through lead, has no appreciable effect upon it, as proved by instances where the same pipe has been used two hundred years for such purposes and still remained intact. The great hue and cry which our would-be wiseacres have made of late about lead poisoning from the use of water passing through lead pipe is, to use a vulgar phrase, all "bosh."

A Subscriber.—If you cannot get the mills in your neighborhood to grind cotton seed, why not purchase a small farm mill and do your own grinding by horse power. Perhaps some of your neighbors might be induced to join you in the enterprise. If you have large quantities of cotton seed and desire to use it in feeding stock, it would pay to get a mill. Almost any dealer in farm implements, advertising in the RURAL NEW-YORKER, will supply you with the article required.

Chestnut Burr.—The long, slender catkins, so abundant on the chestnut trees when in bloom, are the staminate (male) flowers, which drop off entire when matured. But a close examination of the terminal twigs of the same branches will disclose minute embryo burs, upon the apex of which the pistillate (female) flowers are situated. The staminate flowers are a thousand times more numerous than the pistillate, also more conspicuous, the why or wherefore of all this abundance and display, we leave for our theoretical naturalists to determine. The flowers of the various species of the pine show an equal, or even greater disproportion in the sexes, while in some other families of plants the order is reversed and the pistillates are far the most numerous.

Housekeeper.—The art of preserving vegetable or animal substances in air-tight vessels, as practiced so extensively of late years, originated in the early part of the present century. The Agricultural Society of France, by a resolution passed June 21, 1809, made an appeal to the whole nation for information upon this subject of preserving fruits in a more natural condition than had been before practiced. In response to this announcement, one Mr. APPERT made known his discovery and experiments, which were essentially the same process by which our canned fruits are put up at this day. The process of Mr. APPERT consisted principally of—1st. In inclosing in bottle, or glass jars, the substances to be preserved. 2d. In corking or hermetically sealing up the bottles. 3d. In submitting the inclosed substances to the action of boiling water in a water bath, for a greater or less length of time, according to their nature, and in the manner pointed out with respect to each kind. 4th. In withdrawing the bottles from the water-bath at the proper time. Mr. APPERT's excellent treatise upon the subject was translated into English, and an edition of it published in New York in 1812. But it has long since gone out of print and is now a scarce book, although we are fortunate enough to possess a copy.

Farmer.—Almost every one of the dozen or more species of our native hawthorns will make a better hedge than the Osage orange, or even the honey locust, if—and provided—the plants are not attacked by that well-known and common insect the two-striped *Saperda*, or apple-tree borer. The first settlers in Virginia, Pennsylvania and New Jersey were delighted with the prospects of finding a superior hedge plant in our common White Thorn, but they soon found that the above-named borer was the great "If" in the way of perfect and complete success. If you have any doubts on this point, just give the Hawthorn a trial and be convinced.

Bee-Keeper.—It is undoubtedly the fact that the honey-bee does, under certain circumstances, attack and destroy large quantities of fruit. We have known them to destroy bushels of peaches and grapes, and they were not assisted to make the first holes through the skins of the fruit by wasps, as many apiarians assert. The idea of accusing wasps puncturing fruits and asserting that the honey-bee cannot, is simply absurd, because the mouth of the two insects is almost identically the same in structure, as has been shown over and over again by our highest entomological authorities. It is only rarely that the honey-bee will touch our ordinary sweet and juicy fruits, but when a colony once makes a raid on a peach orchard or vineyard it is very destructive.

James L.—The small, cylindrical, brownish beetle, a little over an eighth of an inch long, which you found boring into the bark of a hickory tree, is the four-spined Scolytus (*Scolytus 4-spinosus*, SAY). This is a great pest in some localities, often destroying hickory trees of large size and in considerable numbers. We do not know of any practical method of destroying this pest, except to cut down the trees as soon as it is discovered that they are attacked, and then strip off the bark before the larva or beetles mature. The months of August and September are the proper time to do this, in the Northern States.

W. W. H.—We presume there are breeders of Plymouth Rock Fowls who have birds and eggs of this breed for sale, but we have no positive proof of the fact; besides, men who know how to do business generally advertise in papers likely to reach parties desiring to purchase. We have received a half a score or more of letters within the last two days, the writers asking for the address of breeders of the Plymouth Rock Fowls, but as we see none advertised in our columns, we are at a loss to give a positive answer to any and all desiring this breed.

Sarah Barber, Castalia, Ohio.—(1). Will you be so kind as to tell me what to do for my Geraniums? The first I see that anything ails them, the leaves will wither and die. It will not affect but part of the plant at first. There will be life in the stalk but the leaves will all fall off. My plants have the sun all day. The soil is limestone. (2). Will liquid manure hurt Geraniums? I use it made of fresh horse manure but weak, and don't let it touch the leaves. (3). Are whale oil soap-suds good for Geraniums? If I could write as some can, I would ask lots of questions. I wish the ladies would say more about their flowers.

(1). We should say that your soil is too hard—too clayey, and that herein lies a part of your trouble. If the roots when the Pelargoniums were placed out-of-doors, were not cleared of the old pot-soil and straightened out, this would aggravate the trouble. We advise you to loosen the earth over the roots and to mix sand with it—to discontinue (2) the use of manure-water and (3) whale-oil soap-suds. The first is needless and the second positively harmful.

Agents Wanted.

AGENTS WANTED FOR THE GREAT
CENTENNIAL HISTORY
It sells faster than any other book ever published. One Agent sold 61 copies in one day. Send for our extra terms to Agents. *National Pub. Co.*, Phila., Pa.

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

A PAIR OF WITS.

CHESTERFIELD and Voltaire, born in the same year (1694), were warm and life-long friends. Whatever may have been the erratic Frenchman's vagaries and miffs, for he never had a friend whom he did not at some time abuse. Lord Chesterfield, was too much of a gentleman to take offence, or even notice.

On a certain occasion the two friends were in company at a grand ball in Paris, given by the king's favorite. Chesterfield stood by a marble pillar, gazing upon the brilliant assemblage of ladies, when Voltaire accosted him:

"My lord, you should be a judge in such matters. Now, seriously, do you not think our French ladies the most beautiful you ever saw?"

"Upon my word," replied Chesterfield, with a nod and a smile, "I am not a judge of paintings."

Not long afterwards Voltaire crossed over to England and was present one evening at a party given by an English nobleman in London. A lady in the company, sparkling in jewels, and highly roughed, was particularly attentive to the noted Frenchman, engrossing most of his discourse. Chesterfield, observing, came up and tapped his friend on the shoulder.

"Be wary, monsieur, or you will be captivated."

"No fear, my lord," quickly returned Voltaire. "I am not to be captivated by an English craft sailing under French colors!"

SPARKS AND SPLINTERS.

PAWNBROKERS generally prefer customers without redeeming qualities.

MOTHER Eve was the first bellringer. She used to ring the chimes for Adam.

WHAT letter would make every flower alike? W would make all flowers wall flowers.

BANKERS ought to prosper. They always take so much interest in the business, you know.

OH, for a lodge in the garden of cucumbers!
Oh, for an iceberg or two at control!
Oh, for a vale which at midday the dew cumbers!
Oh, for a pleasure trip up to the pole!

MANY a young man would like to be Neptune just to have such a number of smacks upon his face.

WHY should it be easy to break into an old man's house? Because his gait is broken and his locks are few.

AN author says that one of the uses of adversity is to bring us out. This is true, particularly at the knees and elbows.

THE following epitaph is from a tombstone in Indiana:

Under This sOd oUr Babie liEs.
iT neither cRies nOR holErs,
it lIved JUst t WeNtY 7 dAys,
anD cost uS $40.

CENTRAL PENNSYLVANIA has potato-bugs, and as the worthy husbandman in drab wanders about his garden he remarks feelingly to his wife, "Verily, Martha, the spirit almost moves me to eject with vehemence sundry of the quaint phrases common with the lost ones of the world's people."

"TOMMY, my son, fetch in a stick of wood." "Ah! my dear mother," responded the youth, "the grammatical portion of your education has been sadly neglected. You should have said:—"Transport from that recumbent collection of combustible material upon the threshold of this edifice one of the curtailed excrescences of a defunct tree."

ALL the papers are establishing branch offices at the Centennial. The Smithville Weekly Ink-Slinger having announced that its agent would be found on the grounds daily to receive news and subscriptions, the rival paper in Smithville maliciously exposes the fact that the agent in question keeps a soda water stand in addition to his journalistic duties.

IT is said that if a man is walking for health and enjoyment, four miles an hour is the best gait. This may be true as regards health, but for enjoyment we remember one night when it took us over four hours to walk a mile. It happened, however, that the old folks had gone to camp-meeting, and she had the night-key, and as far as health was concerned we didn't really care if it took all night.—*Norwich Bulletin.*

WARM WEATHER EXERCISE.

Tom—"Hello, boys! Where yer going?"

Boys, on old nag—"Why, we're going ter take a turn in the Park, with the rest of the *upper-ten!*"

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Arboricultural.

PARSONS' SILVER FIR (Picea Parsonsiana).

Of the many species of evergreen trees known under the name of Fir, there are none more grandly beautiful than those found on the Rocky Mountains and the Pacific Slope. The Great Silver Fir (*Picea grandis*) of California is well worthy of the name bestowed upon it by the much-lamented Douglass. It grows to an immense hight in its native clime, in some instances reaching an altitude of over 250 feet, and the stem 15 to 20 feet in circumference. Like most of our native forest trees, it varies somewhat in its general characteristics, giving us what the botanists term natural or local varieties, and among these there are none more worthy of consideration than the *Parsonsiana*, or Parsons Silver Fir, named after the well-known Parsons Brothers, nurserymen, of Flushing, N. Y. The accompanying illustration was taken from a handsome specimen growing in their grounds, but it gives only a very vague idea of the grandeur and beauty of the living tree. The leaves are long and slender, and the smaller branches have a fern-like appearance, which seldom fails to call forth expressions of admiration. At this season the bright green leaves on the opposite sides of the young branches slightly curve inward and upward toward each other, reminding one of the ribs of a vessel when first set to the keel, before being covered, giving to the whole tree a most unique and graceful appearance.

Specimens in our own grounds have withstood the cold of the past five winters without any material injury, and there is little doubt of the hardiness of this fir all through the Middle States, and probably in many portions of the Northern. It has been in cultivation a sufficient number of years to give us a pretty good opportunity to learn its merits, as well as afford the nurserymen a chance to propagate a stock of the trees for sale, which some of them have done; therefore they are not now so rare or high-priced as to prevent persons in moderate circumstances purchasing a specimen or two if they so desire.

SPORTS OR FREAKS AMONG EVERGREENS.

Every person who may have an opportunity of selecting evergreens from seed-beds or from the forests should be constantly on the lookout for what the nurserymen call freaks or sports—that is, peculiar and distinct variations from the original type of the species. By a little care in this direction, some very distinct varieties are frequently secured.

Some of the very best and most attractive evergreens in our own grounds were secured in this way, among which we may mention a dwarf Norway Spruce 20 years old and not three feet high, but five or six broad; a golden-tipped Arbor Vitæ—a real gem in its way, also a silver-tipped variety, which promises to be a worthy acquisition; also, several very compact sorts and a slender drooping-branched variety. Some ten years ago, among one lot of hemlock seedlings, we noticed one which appeared to be very compact and quite distinct from all others. It was taken out and planted by itself, and to-day it is one of the most unique specimens in our grounds.

But we did not commence to write this article for the purpose of telling what we have done, and only mentioned the above to show what others may do if they will only keep their eyes open and have willing hands to respond to the call.

Pines, spruces, firs, and other kinds of evergreens, as sowed in nursery seed-beds or in the forests, are more or less inclined to vary. Some will be more compact than others. The branches of one will grow upright, of another quite drooping, or perhaps somewhat in a spiral form. There will also be variations in the length and color of the leaves. All these varieties can be readily assorted by a practiced eye, and most of such departures from normal types will remain permanent, giving the cultivator an opportunity of securing a diversity of form without being obliged to plant a great number of kinds. One of the most serious errors committed by those who have not studied ornamental gardening is the planting of rows or groups of trees all just alike, or as near alike as "two peas." Now, just the opposite of this would, in nine cases out of ten, produce far the best effect and be more satisfactory to all concerned, and this is one reason why we seek for the oddities or freaks among seedlings of all kinds.

SPECIMEN TREE OF PICEA PARSONSIANI.

Pomological.

WHETHER IT WERE BETTER TO PRUNE.

Here is a subject upon which many words have been expended and will be, possibly, till the end of time, or at least as long as horticultural journals exist and horticultural writers are put to it for something to write about!

It is an ill wind that blows no good, and these worthy upholders of a noble art are fortunate in having to deal with questions so irrepressible—so diffusive and gushing that though corked up to-day securely in one part, they break loose to-morrow in another.

It seems to us that pruning is a question that every person, guided by soil, climate, situation, as well as by the habit and constitution of the plant, must decide for himself; and that no rule for, against or intermediate can be written which the practitioner may wisely follow without corresponding alterations ofttimes so sweeping that the rule has no application whatever. The theory of following nature is an easy theory of immense apriori force—but it is one frequently, if not always, departed from when we come to adapt Nature's ways and productions to the needs of men. Their habitations, their clothing, occupations, food, drink, associations all prove this. Our very methods of sowing seeds, of propagation, of grafting are unknown to nature and these methods have been devised by the necessities of ingenious man to provide for himself those conveniences and luxuries of life of which in detail nature is profoundly ignorant. In her unlimited bounty, she spreads over all soils her vegetable productions adapted thereto. She has made no provisions for high civilizations. She has provided the raw material in rich abundance and bade man utilize it to his increasing, more refined and exacting needs or fancied needs. Thus, man clears the field of its native wood—and concentrated food, as we may term it, is cultivated instead. As populations become more numerous, local tracts of land in a state of nature can no longer supply them with the means of supporting life. As land becomes impoverished, manures are collected—are manufactured and thus the farmer upon a few acres may supply himself with all that is necessary, instead of traveling over extensive areas, as he would be obliged to do, for a scanty subsistence if things were left in a state of nature.

This localization of the products of the earth necessitates changes corresponding to the extent to which nature has been departed from. The little garden by such deviations is provided with its dwarf pears and peaches—its Paradise apples Myrobolan plumbs, Mahaleb cherries—its grape vines etc. and is thus made to produce in considerable quantities what, in a state of nature, it never could have produced at all. It would seem that nature in its superabundance and distribution of every thing had in this way, by its very subserviency to art, provided for the increase of man, for his segregation in villages, towns and cities, and spreading settlements over the face of the earth. Here, says the farmer or suburban proprietor, I have an acre which I propose to turn into an orchard, and in which I propose to plant all fruits which are suited to this climate and to this locality, with which to supply my family. Every step is an utter departure from nature. The ground is heavily manured—20 apple trees—20 standard, 20 dwarf pears—20 peach trees—half-a-dozen cherries and plums—berries of all kinds are here planted. The highly enriched soil induces a correspondingly luxuriant growth, and this growth is restrained by pruning to any desired form and within any desired limit. These fruit trees, rendered prematurely prolific by artificial means, come into bearing in half-a-dozen years instead of 15 or 20, as would have proved the case had they been natural seedlings. Are these art methods promotive of early decay? Doubtless some are, as when we join one species to another by grafting. Perhaps some

are not. Let us take the grape vine concerning which the prunists and non-prunists are very decidedly, if not equally divided—the wild vine of the woods. It is fair to presume that the greater the extent of branches, the greater nutriment is required for support, and that as the root-growth is limited and the branch-growth is not—there will come a time when the branches and leaves will demand more sap than the roots can supply, and the inevitable result is that portions must perish. And this death of what nature reared in her own way is by nature killed. Had the knife been used by the pruner's hands before this inequality between root and branch existed, would the life of the vine have been shortened? We believe there are few advocates, however, of not pruning the vine at all. They oppose *excessive* pruning. They oppose "cutting vines all to pieces." But this is vague, since a vine in a soil capable of supplying all it needs, will make a ten-fold greater growth than one planted in a soil that is nearly destitute of vine food. That vines can be injured—indeed killed—by excessive pruning, there can be no doubt, since the vilest weeds may be exterminated by persistently depriving them of every leaf or bud as soon as it appears. It would seem, therefore, that the degree of pruning in the instance of the vine should be determined by the richness of the soil, the cultivation it receives and the vigor of the variety. For the rest, it is evident that if pruning be carried to an extent to interfere with the reciprocally-full action of root, stem and leaf, the vine must be weakened sooner or later and its life be shortened accordingly. What we have said of the grape applies as well to the orchard. Our orchard is an artificial one. We induce premature fruit; we induce a far greater quantity of fruit in a far less space; we induce by artificial means a quicker, more luxuriant growth. And to confine the results of all these artificialities within the meager space devoted to them—*pruning* is our first, our chief resort.

Pruning may be defined as one of those methods by which man is enabled to adapt the fruits of the earth to a limited space and to his short life-time. He cannot afford to wait half his life for an apple to bear so he embraces art and turns a cold shoulder upon nature who, perfect as are her ways in all other aspects, is yet disdainfully regardless of the value of man's time!

If we could know just exactly the food and the quantity of it a given tree requires, and the situation and climate best adapted to it—doubtless, if we observed these conditions, we should raise a tree that would live and thrive to witness several returns of our great Centennial. But in this we derive no instructions from nature. She scatters her seeds indiscriminately as if all land were alike fertile—and an apple seedling is as likely to appear between two rocks as in the middle of a fertile wood or field.

Take us back years and years, oh! Nature—place us in the midst of virgin soils and bestow upon every man a thousand acres, a hundred laborers, a perfect climate and a life-time of not less than two hundred years—and then we promise our non-prunists to follow nature to the letter as nearly as our intelligence can interpret her.

"A LITTLE LEARNING" NOT ALWAYS "A DANGEROUS THING."

The gentleman who tells the following prefers that his name should not be given.

The Major, as we may call him, began the cultivation of fruit trees three years ago, and, being then as he is now an advocate of doing well whatever he undertakes, planted them in large holes filled in with earth—cut them back, as books instruct, so that the tops should be proportionate to the roots and, knowing well the havoc of the borer in his section, washed them then and afterwards periodically with material that, after much reading, he concluded would prove most offensive or poisonous to this destructive insect. About a month ago, while going over them as usual, he discovered a round hole in one of his apple trees, as round as a bullet and of the size of a pea, about three inches above the ground. It was the first he had ever seen.

As from season to season his fruit trees were unmolested, he had grown to feel confidence in the virtue of his wash and, indeed "master of the situation," so far as it was likely to be contested by the apple borer. Now he recalled with what pride he had pointed out to neighbors and friends the clean, unsheathed bark of his trees, and, condemning his wash and lamenting the hours of labor in its application as utterly worthless, it was with feelings of shame, resentment and anger that he hastened for a wire with which to punch that borer to death. "There is but one remedy" he remembered to have read; "punch them to death with a strong, flexible wire."

The Major was astounded at the dimensions of the cavity. It extended downwards six inches—upwards one inch, with a varying diameter. He punched away with the vehemence of an injured, exasperated person.—He punched himself out of breath and into a perspiration. Then, rather as an act of sweet revenge than one which was necessary to doubly insure the borer's destruction, he mixed carbolic acid, sulphur, tobacco and water, forming a dose as strong as he dared to use, and, with a syringe, squirted the cavity full to overflowing.

Whatever he may have read respecting the ways of the borer was somewhat vague in his mind, so that in the evening of that day, he seated himself, with a pomological work in hand, to add to his entomological lore in general, as it relates to pomology, and to refresh his memory as to *saperda bivittata* in particular. Thus he read in an extract from Dr. Fitch: "The beetle comes abroad in June, and drops its eggs under the loose scales of the bark, low down, near the surface of the earth. The worm which hatches therefrom, eats inward through the bark till it comes to the wood. It continues to feed and enlarge its cell under the bark for about twelve months. Its jaws have now acquired sufficient strength for it to attack the solid heart wood of the tree, and it accordingly bores a cylindrical hole from the upper part of its cell, upward in the solid wood to a length of three or four inches or more. . . . These operations being completed, it throws off its larva skin and becomes a pupa, usually at the close of the second summer, or about fifteen months after it hatched from the egg. In this state it lies through the winter, and changes to its perfect form the following spring, but often continues to lie dormant several weeks after its final change, until the season becomes sufficiently warm for it to come abroad. Awakening then into life and activity, it crawls upwards, loosening and pulling down the chips and dust that close the upper end of its burrow, till it reaches the bark. Through this it cuts with its jaws a remarkably *smooth round* hole, of the exact size requisite to enable it to crawl out of the tree."

"The hole, then," reasoned the Major, "through which I punched for fifteen minutes and then squirted full of the carbolic mixture, was that through which my borer had escaped! Well, a little learning, I conclude, would not have proved, in this instance at least, a very dangerous thing. The eggs, too, may have been deposited before the tree was removed from the nursery—so that though my wash could not have prevented the hatching of the eggs, nor the worm from penetrating the bark in this instance, it yet, perhaps, has prevented the deposition of eggs upon the other trees." The Major's faith in the virtue of his wash is fully restored, and he now calls the attention of his friends to this hole as a warning to examine all fruit trees as soon as they are received from the nursery.

APPLES IN WISCONSIN.

Editors Rural:—In traveling through several counties of Southeastern Wisconsin during the month of June, I was surprised at the general failure of the Apple trees. Out of several hundred orchards that I passed, only one seemed thrifty. This was located on the northern incline of a gravelly bluff and appeared to be in good condition; but even this one lacked the look of vigor and strength one beholds in our Eastern trees.

In most cases, from one-third to two-thirds of the trees were entirely dead. It is probably safe to predict that for apple-growing Wisconsin is a failure.

Another noticeable feature was the fact that in nearly every instance the trees were in grass and the trimming had been entirely neglected. Whether the failure of the trees was the result of improper care, or whether this neglect was caused by the owners' getting discouraged, was, of course, impossible for me to decide. At all events, I would just like either to trim and cultivate these trees, or else cut them down and rid the country of their unsightly appearance. They appeared in sad contrast to the fine fields of corn and wheat that could be seen on every hand.

Nelson Ritter.

Syracuse, N. Y.

Farm Economy.

CROPS IN ARKANSAS VALLEY.

The people of this part of Kansas have been very highly blessed this season by abundant and timely rains, and crops of all descriptions have been a success as far as they have matured. Our wheat crop has been secured in excellent condition and will average about with last year's crop. Oats, barley, rye and all the small grains are out of all danger from drouth or insects. Rye has long been harvested of which we can show some tall specimens measuring in many instances from six to seven feet, corn is looking splendid many pieces being tasseled and silked out and standing higher than a man's head. The prospect never looked better for a large yield of that cereal. Irish potatoes are ripe and turn out well, and in fact vegetables of all kinds are yielding abundantly.

We have not been irritated with any destructive storm, as has been the case in may parts of the West, but have been highly favored in that respect. In fact I have not known since my residence here any very great destruction of property by wind or storm in this section. Our farmers are looking cheerful and I can notice a marked improvement on their faces as compared with the "hopper year" when many of them were losing their all by that destructive insect. They have learned an important lesson which they are not slow to improve—that is, to diversify their crops and to put them in early thus giving them a chance to mature long before the drouth or insects appear.

Our people are making extensive preparations for putting in a large quantity of winter wheat this season, which they have learned by experience can be raised with success throughout the whole of Southwestern Kansas. Our winters are mild and well adapted to growth of winter wheat, as it never winter-kills or heaves out, we having no frosts in the ground, as is the case further north. It matures early, and is harvested long before the possibility of injury from insects.

We have many extensive wheat raisers in the Arkansas Valley, but none of whom have succeeded better than our friend, Hon. Joseph Ross, who came from Pittsburgh, Pa., and purchased a section of land from the A. T. & S. T. R. R. Co. for $7.75 per acre on eleven years' time and seven per cent. interest. In 1874, had 50 acres broken and sown to wheat, with the following results:

Breaking	$3.00	per acre	$150.00
Stirring	1.50	" "	75.00
Harrowing	25	" "	12.50
Seed, 75 bush	1.25	" bush	93.75
Drilling	25	" acre	12.50
Harvesting and stacking	2.00	" "	100.00
Threshing 1,250 bush	05	" bush	62.50
			$506.25
Cost of land, 50 acres, at $7.75 per acre			387.50
			$893.75
1,250 bush. of wheat at $1.15 per bush			$1,437.50
Net profit			$543.75

Judge Ross has just harvested a field of 600 acres, and will seed 1,000 acres to wheat this fall. The Judge is only one of the many of monied men who are improving the country and making the prairie to blossom like a rose, and getting good returns for the money invested.

Arkansas Valley, Kansas. B. M. House.

CHEMICAL AFFINITIES—SUPERPHOSPHATE.

We take the following from a sensible paper by Mr. H. F. French read before the Massachusetts Horticultural Society.

What we call chemical affinities and chemical combinations, are mere names for what we do not comprehend. Phosphoric acid and lime will combine in two proportions only. Two atoms of each form phosphate of lime. Three atoms of phosphoric acid and one of lime from superphosphate. Nobody can tell why they may not as well combine in other proportions. To change phosphate of lime, which is said not to be readily soluble, into superphosphate, we make use of the chemical affinities of the substances. We have seen that in phosphate of lime, the phosphoric acid and lime are chemically combined in the proportion of two and two. They form a sort of equal union or marriage—one bone if not one flesh. Now to break up this union and entice away from the phosphoric acid the lime, which may be regarded as the weaker vessel, we bring into her neighborhood an object of stronger affection or affinity. Sulphuric acid and lime are found to have a stronger affinity for each other than phosphoric acid and lime, and by adding sulphuric acid, we entice away a portion of the lime, forming the new combinations, sulphate of lime and superphosphate. Why these affinities exist, and why these new combinations are formed, it is as difficult to explain, as why one young gentleman and lady have a stronger affection for each other than for all the world beside.

What new combinations take place in the soil after our fertilizers are applied, we can only guess, and many substances produce effects entirely beyond our comprehension. Two hundred pounds of gypsum applied to an acre, have on some soils produced an almost magical effect; yet I suppose chemistry has thus far failed to solve the mystery. It is thought that the elements that compose gypsum do not enter into the composition of the plants, but its effect is due to its chemical action upon other nutritive elements, probably potash and magnesia, rendering them available to the growing crop. Liebig says that he found by experiment that a solution of gypsum in contact with arable soils underwent decomposition, and formed combinations quite contrary to the ordinary affinities as observed in the laboratory.

Lime for Potato Beetles.—Farmers who object to using Paris green on their potatoes for the purpose of killing the potato beetles, can in a great measure keep this pest in check by the free use of lime. If a little carbolic acid is added it will be still more efficient in destroying the larvæ.

Field Crops.

KENTUCKY BLUE GRASS.

There are doubtless many farmers who think what is termed Kentucky Blue grass thrives only in the State from whence it receives one of its common names. But the facts are, that it thrives in all of the Northern and Middle States, and we have no doubt as the following would seem to show, that ere long some of our Western prairies may be transformed into grand Blue grass pasture.

The best farmers in the Blue grass region of Kentucky, generally regard an acre of this grass, equal in value to an acre of corn.

When we take into consideration the cost or value of the labor in raising an acre of corn, the value of the Blue grass will be more fully appreciated.

The intelligent farmer will make his Blue grass pasture sustain a larger number of stock the year round in better order than the same number of acres of corn.

There is no crop which requires more intelligent management for profit than this grass. As it remains green and nutritious during the winter, there is no necessity for cutting and curing, and it is almost valueless for hay. To insure a good sward, it should never be mown, and as it heads several times during the year, one acre well set and allowed to seed will be sufficent to set a large pasture in a single season by allowing stock to graze upon it when the seed is ripe, and have access to shade woodland and water adjoining.

The writer of this lived in the Blue grass region of Kentucky from 1837 to 1849, and during that time, carefully observed the management of those pastures which gave to Kentucky a world-renowned reputation.

The success of the Alexanders, Van Meters, Vileys, Williams, and other renowned stock raisers of Kentucky, depended largely upon this important grass.

One of the Van Meters of Bourbon County purchased a farm at a $100 per acre. There was not quite one-fourth of the farm in Blue grass. The balance had been cultivated in hemp and corn. The wood land as is usual there, was well set in Blue grass, and afforded the winter food for the stock usually kept on the farm.

Van Meter raised no grain upon this farm, and by allowing his Durham cattle to graze upon the seeded Blue grass and roam at will over the adjoining fields, the whole place was in an incredible short time well set in grass by confining the cattle to one pasture at a time, leaving the others to seed and form a mass of succulent, juicy, rich food, a foot deep, literally a mass, a mat for fall and winter use, a larger number of cattle were kept fat the year round, than was formerly kept by the old process of raising corn on a part.

Moving to Western Missouri in 1849, I found many of these Blue grass farmers and their sons in Ray, Clay, Lafayette and Jackson counties, Clinton County, north of Clay, was a prairie sparsely settled, and little if any Blue grass in the county.

The farmers of Clay and Ray, where Blue grass abounded, made frequent visits to Clinton Co. and in a short time Blue grass was seen growing in patches on the roadside, and years after spreading over thousands of acres of unimproved prairie land, that was supposed to be unsuited to the growth of this most valuable of all grasses.

Ten years after I visited Topeka and other portions of Kansas, where repeated efforts were being made to start Blue grass and all seemed discouraged and disappointed.

Now, June 1876, this grass is found in nearly all the lawns about the residence and unfortunately before it is sufficiently set to form a heavy and rich sward, is being mown and the seed carried off in indifferent hay.

From the foregoing it will be readily seen, that I regard as the most successful and about the only successful way to seed Blue grass pastures, is to start a patch with care, then by grazing stock upon it and allowing them to roam over the pasture, scatter the seed and thicken up the sward.

Blue grass is especially valuable for winter grazing, and where the prairie is fenced up, it is important to have two Blue grass pastures; keeping one exclusively for winter use, alternating each year. By industriously and persistently pursuing this plan, a few years, Kansas will become celebrated as the great Blue grass region of the *West*.

Ed. D. P.

Dairy Husbandry.

AVOIDING THE WASTE OF BUTTER IN CHEESE MAKING.

A CORRESPONDENT writes us that he has difficulty in cheese making. "The top layer of milk in the vat after coagulation is, at times, very soft and tender, and in cutting and working the curds the oil or butter passes off in the whey." The chief reason for this, we presume, is that the milk is not well stirred at the time of adding the rennet, or perhaps the temperature of the milk is too high and too little rennet is used, and thus the cream accumulates to excess in the top layer of milk. After the rennet is added to the milk and up to the time coagulation begins, the buttery part, or the cream of the milk, is obeying the law of gravity and is gradually making its way toward the surface—some even, if the coagulation be delayed, collecting so as to form a stratum of cream. The curd of "whole-milk" consists of all the caseine or cheese proper of milk, as well as of most of the butter. Now, it is the caseine which imparts to curd its consistence and firmness. In the upper strata of milk, the coagulation of which has been retarded, the proportion of butter far exceeds that of the caseine, and the consequence of this is that such curd is soft, easily broken, fatty, and is difficult of being made into cheese. Rennet acts exclusively upon the caseine of the milk and not upon the butter, the globules of which become imbedded in the caseine in the act of solidification, and in this mechanical way are made to form part of the curd.

Now, from this explanation some useful, practical suggestions may be drawn. Thus, since warmth hastens the ascent of the butter, the temperature of the milk should never be raised above that necessary for the formation of the curd. Further, every precaution should be taken to insure the speedy coagulation of the curd, not only by the due regulation of the temperature, but also by the use of rennet of sufficient strength and quantity, so as not to prolong coagulation an unreasonable length of time. Lastly, before the addition of the rennet, the milk should be well stirred, so as to mix as far as possible with it any butter which may have risen to the surface, for when the cream has once risen and formed on the surface of the milk it is difficult to diffuse it by agitation through the fluid in the same uniform manner in which it was originally suspended. In spite of all our endeavors, much of it will soon rise again to the surface; and hence we see how, with improper or rough manipulation, the waste of oily particles is liable to occur in passing off with the whey.

The difficulty of returning to the milk all the cream that has once risen and incorporating it with cheese in the process of cheese making is well demonstrated in the lately-invented method for improving skimmed milk for cheese making. In the process referred to, about 30 lbs. of butter are taken from the milk and the skimmed milk is treated with a cheaper fat. Now, in this process a larger quantity of rennet than for ordinary full milk cheese is used, in order that the coagulation may be perfected in the shortest space of time and thus catch the oily particles in the caseine and hold them in the cheese. The oil is thoroughly mingled with the milk by stirring the mass, and then the rennet is added; but although the coagulation is rapid, it is found that the skimmed milk will not absorb, or take up, much more than 12 lbs. of fat in the 1,000 lbs. of milk which originally contained 30 lbs. And the reason for this doubtless is because in returning the fat to the milk it cannot be distributed through the particles of caseine in the minute form that the butter globules obtain originally in the milk In cutting and working the curd the larger fat particles are laid bare of their covering of caseine, and thus mingle with the whey and pass off during the manipulation of the mass. It will be seen, therefore, in full-milk cheese making, a point of great importance is to keep, as far as possible, the cream from rising.

It will be observed, also, that where there is an excess of fat that has accumulated in the upper layer of milk with a corresponding loss of fat in the lower layers, the curds will not be of uniform consistency. And even though they be afterward mingled together in the stirring and salting, yet we shall find there will be lumps of quite fat curd distributed unequally through the curds deficient in fat, and this will have a tendency to affect the cheese unfavorably while curing. One of the arts of making fine cheese is to have every portion of the curd of the same texture and consistency when it goes to press. The fermentation or curing process is then carried on alike, and we have uniformity in texture and flavor. But if soft particles of curd be mixed up with those of firmer texture, it will be seen there will be a lack of uniformity in the fermentation, while excessive portions of fat in separate lumps will have a tendency to become rancid, and thus the cheese must soon get "off flavor." We are convinced that much of the "off-flavored" cheese comes from this source.

The temperature of the milk when ready to set with rennet should not be above 85°, and it should be thoroughly stirred at the time of adding the rennet, so that all parts of the milk be uniform in consistency. Then if coagulation is perfected before the cream has a chance to rise and accumulate in the top layer, and if the cutting and working of the curds be carefully conducted, the trouble complained of by our correspondent will be avoided. The use of an agitator in the milk during the night is to be recommended, as it prevents the cream from rising and at the same time keeps the milk in good order.

The points we have named are important ones to be considered in the manufacture of cheese, and by attention to them, we are persuaded, serious troubles will not unfrequently be avoided.

INFORMATION FOR THE JUDGES UPON BUTTER AND CHEESE.

CENTENNIAL EXHIBITION,
PHILADELPHIA, Pa., July —, 1876.

A SPECIAL exhibition of Autumn Butter and Cheese will be held from Oct. 17 to Nov. 1. The Dairy Building will be ready for the reception of exhibits at any time prior to the latter date.

Butter will be judged as to the make, color, flavor, texture, solidity and keeping quality. Cheese will be judged as to quality, make, texture, keeping, flavor and color.

Each exhibitor is requested to supply answers to the questions upon the accompanying blank form, and to transmit the form, when filled out, to the Bureau of Awards.

If the space left opposite the several questions is found to be insufficient for a satisfactory statement in reply, the answers may be written on separate sheets of paper, numbered to correspond with the questions. A. T. GOSHORN,
FRANCIS A. WALKER, Director-General.
Chief Bureau of Awards.

BUTTER QUESTIONS.

1. What breed of cows produced the milk? 2. What was their winter food? 3. What their summer food? 4. How deep was the milk set? 5. Were large or small pans used? 6. At what condition was the milk and cream when the milk was skimmed? 7. Was the cream churned when sweet or sour? 8. If sour, was it slightly acid or very sour? 9. Was the butter gathered in the churn, or was it left in a granulated condition? 10. How often was the churning done? 11. Was the buttermilk washed out or worked out? 12. How much salt and what kind was used? 13. Was the butter worked more than once? 14. How soon was the butter worked and packed after churning? 15. Was the butter colored, and if so, with what? 16. How was the package prepared? 17. With hot or cold brine? 18. Is the butter creamery or dairy butter?

CHEESE QUESTIONS.

1. Was the cheese made from one milking or two? 2. Has any cream been added to or taken from the milk, and if so, to what extent? 3. At what temperature was the milk set? 4. How soon did coagulation take place? 5. How soon was the curd cut? 6. How were the curds cut, if with knives horizontally or perpendicularly, or both? 7. How fine was the curd cut?—Do you depend upon breaking and cutting, or on cutting only? 8. Was all the cutting done at one time? 9. How high did you heat, and what time did you take to raise it to that temperature? 10. Was the curd raised to the highest temperature by one continuous heat or by several applications? 11. Was the whey drawn as soon as raised to the highest temperature, or left on until the curd was ready to go to press? 12. Was the curd allowed to pack, or was it kept stirred and in granular form? 13. Do you use a curd mill? 14. By what rule do you decide when the curd is ready to go to press? 15. How much salt was used to the 100 lbs. cheese or curd, and what kind of salt? 16. At what temperature was the curd put to press? 17. Was the milk colored, and if so, with what? 18. How much milk was required to make first cheese? 19. At what temperature was the cheese cured? 20. At what date was it manufactured? 21. From what breed of cows?

THE MILKING BARN IN HOT WEATHER.

A LARGE number of dairymen need to make improvements in their milking barns. The milking barns which are thought to be most convenient by dairymen of long experience are arranged with doors opening at the end of the stable, the cows taking their place on either side, their heads turned outward, and with a wide, open space between the two rows of animals. The herd enters the stable at the wide doors in the center of the end part of the building and the animals take positions on either side, and thus one man is enabled to make secure in the stanchions a large herd in a very short space of time. If wide doors are arranged on both ends of the building, and if it stands so as to get the sweep of prevailing winds through the center of the stable, the animals and milkers may have a tolerably cool place in hot weather during the time of milking. But in many cases the barn is so located and the ventilation so imperfect that the heat and animal odors are almost intolerable through the hot months. Such a state of things causes great discomfort to both milkers and animals, besides doing great injury to the milk.

We have referred heretofore in these columns to the bad character of milk from overheated cows. Fast driving from pasture to a hot, stifling stable—there to swelter and breathe over and over the air vitiated by the odors and emanations of a large herd—is not likely to be a favorable condition for nice, sweet, healthy milk. Now, in order to remedy the bad construction of such stables, long, horizontal openings are made in the sides of the building directly in front of the cows' heads. These are hung with doors which are raised in hot weather, thus giving ample ventilation immediately in front of the cows. We have seen milking barns so arranged that almost the entire side of the stable could be thrown open or closed at pleasure, and such stables are a great relief during hot weather, affording comfort to man and beast and amply paying the cost of the improvement by the better quality and quantity of the milk yielded. A cool, clean, well-ventilated milking barn is one of the luxuries connected with dairy farming during our intensely hot summers, and no progressive farmer can well afford to be without one.

SUBSTITUTE FOR RENNET.

LINNÆUS says that the solid milk of the Laplanders is prepared by pouring it warm and fresh from the cow over a strainer on which fresh leaves of the Pinguicula vulgaris, or Gouk's hose, have been laid. The milk, after passing among them, is left for a day or two to stand, until it begins to turn sour. It throws up no cream, but becomes compact and tenacious and most delicious in taste.

It is not necessary that fresh leaves should be used, and even a small portion of the solid milk will act upon that which is fresh after the manner of yeast. The Pinguicula belongs to the family of Butternuts.

There are a number of other substitutes for rennet; but we do not hear of any of our dairymen making experiments to discover whether any one of them can be used with better results in cheese making than the dried stomach of the calf.

The Herdsman.

DIGESTION IN RUMINANTS.

OF late there has been so much discussion in regard to Mr. MILLER'S proposed system of "meal feeding alone," for cows that it may be well to keep in mind the structure of the digestive organs of ruminants in general. We have no doubt of the fact that Mr. MILLER has kept his cows alive for months on corn meal and water alone, and he and the advocates of his system may do so again, still it is a species of cruelty which few men would tolerate even though they would make a little by the operation. At a meeting of the Eastern Pennsylvania Experimental Farm Club, Dr. C. B. MICHENER in reply to questions relating to the effects of exclusive meal feeding according to the MILLER system said:

The cow has not the power to direct food to the first or third stomach at pleasure, but its destiny depends almost entirely on its bulk. Again, when cows eat rapidly and with their heads held low, most, if not all of the food then eaten goes to the paunch or first stomach. Of course from the vermicular motion of the stomach some of the food finds its way into the third, through the second stomach, in a very short time. Now one reason why food that has been remasticated passes directly into the third stomach is this, if thee has not noticed, and undoubtedly thee has, the cow, when about to swallow her cud extends her nose and head, seemingly on purpose, though manifestly by instinct, to straighten the direction of the esophagus. This traction of the stomach, through the tension of the esophagus, brings the esophagal groove more directly in contact with the opening of the esophagus into the rumen. From this connection a continuous passage is made to the third stomach, and it is through this passage that the food reaches the third stomach after having been rechewed. Do not think that those who advocate meal feeding exclusively have any very good reasons to offer on their side of the question. They admit that a cow thus fed does not chew her cud.

As I showed in the article I sent thee, this act of rumination is positively essential to healthy digestion. Again, to have rumination you must have bulk and quantity of food. This you cannot get unless your meal is mixed with some coarse, bulky substance. As to throwing out of use entirely the paunch, I think it would be well for us, with our finite minds, to recognize the wisdom of the Infinite One, by carefully studying the functions of these different compartments and not pretend to more knowledge than our Maker, and discard entirely one or more of these stomachs. In the manifold the food does not pass from one compartment to another directly but is taken up between these leaves; is triturated, drops back into the channel and may again be hooked up by the next compartment, and so on. Some of these compartments have at their base little sub-compartments, made by a very narrow leaf or fold.

Where we have "Impaction of the third stomach" as a disease, *per se*, then this condition of impaction is due to the cause thee mentions. This stomach very frequently becomes impacted during acute febrile attacks, and is at times a very serious complication. The tendency to impaction of the many plies during any febrile disease, has led me to adopt the practice of administering a full dose of cathartic medicine—1½ to 2 pounds of Epsom salts—at the very commencement of the attack, whether the condition of the bowels calls for it or not, and thus far I have had only favorable results from this plan of treatment. During fever, all the secretions of the body are checked, hence this tendency to "impaction." To recapitulate:—1st, coarse, bulky food chewed for the first time, passes into the first stomach; 2d, fine moist food passes, some into the first and a greater portion directly into the third stomach. 3d, remasticated food (from this mechanical condition, aided by the position relative to the mouth of esophagus and commencement of esophagal groove, produced by the extension of head and neck) passes directly through the esophagal groove into the third stomach.

SHORT-HORNS FOR MILK.

THE breeders of fancy stock sometimes get some good hard blows dealt them by the good old practical farmers who fail to see why they should pay a large price for a cow's grandfather's reputation, but we have not seen a more sensible thrust at the "fancy" for a long time than the following by J. S. LATIMER, in a late number of the National Live Stock Journal:

The very sensible inquiry of John Cook, with your remarks thereon, in the last number of The Journal, and his and your suggestions in regard to what the farmers want in the way of cattle, brings to my mind the many letters and inquiries I have received:—*e. g.*, "Have you any Short-Horn cows that are good for milk?" "Have you any cow for sale that a farmer could buy at a fair price, that will give milk enough to raise her calf, and furnish some for family use?" "Have you any cows that will raise their own calves?" Dozens of such inquiries as the above are made, especially at the fairs (as any one knows who has attended them and shown cattle). I was not a little amused at a veteran pair of well-to-do persons, that had raised a large family, and accumulated a goodly share of this world's goods, at a fair in Henry county, Ills., where a grand display of several leading herds of this part of the State were on exhibition. After looking with much interest over the many very fine animals, and asking many questions as to their merits, they seated themselves near, in the shade, the old lady remarking (to her better half), with a significant look and gesture, "Them cattle are purty to look at, but they're no 'count for *milk*—won't *raise* their own calves—have to have some old *scrubs* to suckle their calves. They'd be purty cows for a young pair, like we was 40 years ago, to start with. How would we have raised all the boys and girls that we have, without *milk?* You've *got* to have *milk* to raise calves and pigs, and *children, too*, old man!" *That's so.* There is no use of dodging the question, and the true answer.

What do we want cattle for? Rich men and lords can afford to have them for pedigrees and playthings, but the toiling masses of farmers will not and dare not, overlook the useful, practical and essential qualities of the Short-Horn cow. And if the breeders of America would comprehend the real wants and wishes of the American farmer, and quit breeding for pedigree alone, and breed for the true merits of cattle—beef and milk—instead, as is now the disposition, of breeding for pedigree, without any of the above qualifications, then, and not until then, shall we see the farmers enlisting *en masse* in the enterprise. I will say, for the benefit of Mr. Cook and others, that I have always found the Short-Horn cow equal, if not superior, to any other for milk and butter; and I believe that amongst the old and reliable families of cattle, where they have been bred for the useful qualities (as they should be), you may yet find cows that have no superiors at the pail. I have at least three families in my herd, and all the fault I find with them is, they give too much milk. I have had no other than thoroughbred cows on the farm for three years past, and have only milked what I had to—that is, what the calves would not take—and, at this time, from 8 cows (4 of them heifers), raising 9 calves, we are getting four pailfuls per day; and I have never sat down to my table without having an abundance of nice butter, and plenty of milk and rich cream, which I think a good thing for *children*, as well as *calves* and *pigs*, all three of which are strictly essential on a well-regulated farm.

The Centennial.

CENTENNIAL CORRESPONDENCE.

CENTENNIAL FIELD EXHIBITION, }
SCHENCK'S STATION, Pa., July 19, 1876. }

THE inhabitants of Bucks County must by this time have become accustomed to warm weather, as they have had nothiog else for a number of weeks past. Another "scorcher" opened this day. The Jurors on Agricultural Machinery arrived upon the ground at 10:30 this morning, finding everything in order for a start at the the tests to which they intended to submit the implements. The first thing in order was to set the Dynamometer, and while this was being done I took the opportunity to look about me. The scene was no common one. At one end of a 46-acre square field were ranged at convenient distances apart a dozen or so threshing machines, with four or five small portable steam engines. Beside several of the threshers were large stacks of grain awaiting its time to be passed through the quickly-revolving teeth. Here and there a train of horses could be seen attached to large hay wagons, and numerous attendants upon the implements, teams and engines were running hither and thither making preparations for the trial. One of the most attractive and interesting features of the whole affair, however, was the two Road and Farm Locomotives, manufactured by Aveling & Porter of Rochester, England, sent here in charge of their General Agent for the United States, Mr. W. C. Oastler, No. 43 Exchange Place, New York City. Superintendent Geddes, in one of his moments of leisure (I think he had about four such moments each day), remarked to me that he had no idea what he should have done without those locomotives. They seemed to be capable of going anywhere that a horse and wagon could and of doing twenty times the work. One of these locomotives was started off toward the middle of the field, placed in position and used to supply power for testing the threshers. The other was coupled to the threshers and brought them to the spot for testing. They turned in almost their own length, and were capable of putting the heaviest machine in position with the greatest ease. The engineer of the locomotive which was used for this purpose made no mistakes and never got confused. He made his steam horse do its work every time.

Since I first saw these engines, I have been astonished that so few of them have been utilized in America. Mr. Oastler informs me that he has but fifty-five in use in this country, and I am quite positive that one could be used on all our large Western farms profitably. But we shall come to them in time.

The testing apparatus being set, the Westinghouse Ten-Horse Power Thresher was started off on its 2,000 lbs. of grain, which it finished in 16½ minutes. This was followed by the Farquhar Thresher, which finished the same task in 18 minutes and 10 seconds. Then the Geiser Thresher passed through its 2,000 lbs. in 22 minutes. Of course it took much more time to set the machines and get them to work than it does to tell of it, so that the day was mostly consumed with these three tests. The Jurors returned to Philadelphia, leaving a crowd of tired exhibitors and employes, together with a few lazy newspaper reporters.

July 20.

AT 6 o'clock A. M. every indication gave excellent promiso of a "piping-hot" day, and I assure you we were not disappointed. The rays of the sun were simply scorching, and shade was a thing entirely unknown in the field. I could have gone to a neighboring orchard, but should then have missed my pleasant task of following the Jurors about, and should also have lost all the witticisms of friend Coleman, the British representative.

The Jurors had this morning dwindled in numbers to three, of whom that untiring Britisher was, of course, one. If he labors as industriously in his position of Agricultural Editor of the London Field as he has done at these trials or exhibitions, he must make one interesting department at least. SHORT-HORN.

LIST OF SPECIAL PRIZES.

By the Jersey Cattle Breeders' Association, for the best Jersey herd, $1,000.

By the Pennsylvania Ag'l. Society, $1,000, to be given in prizes as follows:—For the best exhibition of Cereals, $100; do. Forage Plants, $100; do. Feeding Roots, $100; do. Herd of Short-Horn Cattle, $100; do. Jersey Cattle, $100; do. Swine, $100; do. fleece of Long-Wool Sheep, $100; do. Short do., $100; do. Middle do., $100; do. display of Poultry, $100.

By Memphis Cotton Exchange, for the best bale of cotton from the States of Mississippi, Alabama, Arkansas and Tennessee, $1,000.

The N. Y. Agricultural Society offers free transportation on all of their prize animals.

By B. K. Bliss & Sons, for the best display of potatoes in pecks, $200.

By D. Landreth & Sons, for the best display of vegetables at stated periods, $100.

By Mr. Landreth, for the best essay on Forestry, $75.

By Peter Henderson & Son, for the best essay on the Cultivation of the Cauliflower, $50.

By Peter Henderson & Son, for the best essay on the Cultivation of Celery, $50.

By the Produce Exchange of Philadelphia, for the best cheese, $150.

Four $50 prizes for Horses, Cattle, Sheep and Swine that have used the American Cattle Food—$200 in all. By the Proprietor.

By the Pennsylvania Poultry Society, for——, $150.

Cup by Forest and Stream, for ——, $100.

Cup by Detroit Gun Club for best Setter from State of Michigan, $100.

By Philadelphia Sportsmen's Club, in two prizes—one for best Setter of any breed one year and over, and the other for best Pointer of any weight one year and over, $200.

Cup by Chicago Field for ——, $50.

Cup by C. S. Wescott for second best Setter bitch of any breed over one year, $50.

By Frank Roan, for the best imported English Setter, $50.

Cup by Charles E. Tucker for the best Cocker Spaniel, $20.

Silver Mounted Field Whip by Jno. Krider, for the best bred American Setter of——.

Silver Dog Whistle, by Capt. A. H. Clay, for second best American Setter of——.

Silver Collar by Frank Roan for the best *Dachsund* (German Beagle).

By N. E. Bee-Keepers' Ass'n for the best and most meritorious display of Comb and Extracted Honey and Wax, $35.

By the N. E. Bee-Keepers' Ass'n for the best essay on How to Keep Bees Successfully during the Winter and Spring, $25.

By the Dealers of New York City, for the best sample of hops, $50 and $25; second best sample, $30 in gold; third do., $20 in gold.

These prizes amount to over $5,000. Further particulars hereafter.

WISNER'S TIGER RAKE.

AT the great Centennial Exhibition of Hay Rakes at Eddington, last month, the first rake sent in was "*Wisner's Tiger*," made by J. W. STODDARD & Co. of Dayton, Ohio, and exhibited by WISNER himself. To show the ease of handling this implement, WISNER had a boy, nine years' old, to operate the rake. The Jurors gave it a thorough examination and were well pleased with its work. The boy, at short notice, easily adjusted the rake to suit the different wants of the Committee.

At the trial of reapers, held later at Schenk's Station, the enterprising inventor of this rake, after the trial was over, with one machine and a change of horses, raked the 46½ acres of stubble in 11 hours. The gleanings were held separate and threshed in the barn by Heebner's Giant Thresher. Mr. STREETER, the owner of the crop, reported as the result about 56 bushels of good wheat, equal to any in the stack. It was in good condition and clear from dirt, which was more than could be expected when consideration is given to the very dry condition of the ground and the trampling which it received from the crowd of visitors to the exhibition. Mr. STREETER expressed himself much pleased with the result.

HEEBNER'S THRESHER AND HORSE POWER.

THE *Giant* Thresher, run by the *Superior* Two-Horse Level Tread Power, (HEEBNER & SONS, Lansdale, Pa.,) was tried in Mr. STREETER'S barn. Their first work was on the gleanings raked by *Wisner's Tiger*. In this they showed well. They were then given the full test by the Committee, and threshed their 1,000 lbs. of straw in 15¼ minutes, (this straw was heavy, but not well filled). The work was well done, the wheat being cleaned with very little cutting and only a slight waste, thus making an excellent show among the numerous machines exhibited. The Committee appeared to be satisfied with the work. The cheapness of this implement and its good work, specially recommend it to the farmers generally.

CENTENNIAL NOTES.

Dairy Products.—Mr. LANDRETH, Chief of the Bureau of Agriculture, announces that special displays of dairy products will be held during the first week, respectively, of August and September. The August exhibition will comprise only Cheese; the September exhibition, Butter, as well as Cheese, the cooler weather then permitting a display. The exhibition of the present month having been such a full success, it is anticipated that equal energy will be diplayed to assure the exhibitions of the two next months. Awards will be made at these times in accordance with the rules of the Commission.

Bench Show of Dogs.—The Commissioners have decided to hold this show on the 4th of September, instead of the 1st, and close on the 8th. This is decidedly a wise course to pursue, as many owners of valuable dogs would not have sent their animals had they to remain for the long period of eight days. Medals and Illuminated Diplomas, certifying the points of all meritorious dogs, will be given. Entries close on Aug. 1. A very large show is expected.

Industrial Topics.

REPLY TO POLITICAL DUTIES.

MR. EDITOR:—If you wanted a pair of boots, would you employ a tailor to make them? Would you send for your minister to draw a legal document, or to your lawyer when wanting advice about any of the ills that flesh is heir to? Or would you not, rather, if you wanted the best service, employ, in hope of obtaining it, such persons as have made a life-long study of the particular trade or calling. How could you expect the best farmer in the country to be able to make the calculations necessary for the proper erection of a woolen mill, or the most distinguished physician to superintend a cheese factory. An engineer can run a locomotive; but a farmer's boy could beat him in running a furrow. Jack at all trades and good at none is usually correct. To know his business, trade or profession as he should, as he must, to be of real service to himself and to community, one must give to it his best thought and his best work. His highest endeavor must be to stand at the head of his class, and with all his exertion, he will be fortunate if he does not find himself far below the place where he knows he ought to be.

But, do you ask, what is all this about? Please to read your leading Editorial in RURAL of July 22d, and see what you say about Professional Politicians, and admit to begin with that what you meant was political quacks. What is politics but the science of government; and what study opens a wider field in which a man can use all the brains he is favored with for the good of the commonwealth. A good government is the great desire of all good people, and how to obtain and secure it, should be among the first thoughts of the American citizen. A government "for the people, of the people, and by the people;" a government that will require every citizen to do his duty, while it sees that he is protected in his rights; a government that shall stand erect before all other governments and compel respect.

In order to make hats, coats or boots, one must devote a considerable time in learning the art. An understanding of the science of medicine requires many years of study and experimental practice. A young lawyer is looked upon with distrust. Experience and judgment, which are the results of years' of hard study, are demanded, before we commit a cause to the hands of an attorney. The science of Government, politics is beyond and above all these, and would you expect it to be understood by those who have given no thought to it? Would you call the architect, the farmer, or the machinist, however skillful they may be in their own departments, to adjudicate a question of international law?

No, Mr. Editor, the great want of this country is politicians, statesmen—men educated for the business, from their youth up.

We have many celebrated physicians in the country; but there are more quacks. We have lawyers equal in talent and acquirements to those of any other country, and pettifoggers in great abundance. We have but few politicians; but we have many who take for themselves the name—many asses who robe themselves in lion's skins and succeed in deceiving the public—only because the public are easily deceived. The science of politics should be so disseminated that such deceptions would be impossible—that the citizen shall demand from the politician as good and honest service as he does from any other person, and be able to judge intelligently, whether it be or not rendered. A great trouble is, what goes current by that name is not politics, any more than a greenback is money. "Let names go for what they are worth," said ASTOR. People go down in Wall Street and cheat one another, and they call that business. Office seekers, thieves, leaders of rings, gamblers, men wanting in the first principles of moral honesty, write Politician on their foreheads, and the unwashed, uneducated bow down and worship.

What we want, what we must have, is sufficient information and intelligence among the people to distinguish the true from the false, and, as the servants of this people, men who shall give the honest labor of their lives to the service of their constituents, after having fully prepared themselves to be Professional Politicians. L. A. R.

Scientific and Useful.

PETROLEUM AS A PROTECTION AGAINST INSECTS.

A CORRESPONDENT of an English paper writes that he "has tried a number of experiments, extending over a course of years, which satisfy him that paraffine oil is something more than a substitute for the best guano. His garden having been overrun with rats and mice, he had to sow double quantity of peas and beans, and sometimes to sow these twice over. Last year he sowed 22 pounds of beans and 6 pounds of peas without any manure, but he previously soaked the seeds for a short time in paraffine oil. None were touched; every pea and bean germinated and the crop was enormous. Formerly his onions were attacked by maggots, and his turnips by fly; but during the last eight years he watered between the rows with a mixture of 2 ounces of paraffine oil with 6 gallons of water. Both maggots and fly immediately disappeared, and the crops became extremely large and fine. He recommends that seeds of all kinds should be sprinkled with the oil before sowing, or that a certain portion of paraffine oil should be poured over dry earth or sand, and this prepared earth should be sown as guano. He believes that such earth is a powerful manure as well as a remedy for wire-worm, grub and all garden, field and vinery pests. He states that grain sprinkled with the oil is quite safe from all birds as well as insect vermin. For watering green vegetables, he recommends a mixture of two wine glassfuls of paraffine oil and six gallons of rainwater, and states that this will do no injury to the plants, but that the growth succeeding its application is something wonderful, and that onions and carrots should be watered with this when one inch long."

The American Manufacturer, in commentary upon the above, says:—The idea that any form of petroleum is of any value as a fertilizer is entirely erroneous. Petroleum contains nothing that can be of use as plant food, unless all heretofore accepted theories upon this subject are rejected.

But there is much in favor of the idea that its use as a protection against insects, will prove beneficial. It is a fact that its touch causes almost instantaneous death to any of the smaller insects, and it is quite reasonable to suppose that a field over which it had been sprinkled would be abandoned by them. Great care should however be exercised in its use. All the lighter, more volatile products, such as gasoline, benzine, or common kerosene should be rejected, for the reason that any of these will kill a plant as quickly as a bug. We should advise any who feel disposed to test the value of petroleum for this purpose to use some of the heavy lubricating oils, and instead of applying it in a liquid form, to saturate some earth with it, and when quite dry sprinkle it over the ground around the plants, but not on them. Used in this way it may be of value, and it is not too late to test its merits fully the present season.

Sheep Husbandry.

HEAVY FLEECES.

SEEING an article in your issue of June 24th, signed a Subscriber, and giving the weight of some sheep belonging to Messrs. SWEET & BROWN of Jeddo, Orleans Co., N. Y., and wishing to know if any of the subscribers of the RURAL can beat them, I send the following:

Mr. JAMES OSMOND, residing three miles north of Suspension Bridge, Niagara Co., N. Y., has a flock of Leicester sheep, and I will give you the weight of a few of them. No 1 is a two-year old buck, weight 310 lbs.; No. 2 is a three-year old ewe, having two lambs, weight of ewe 310 lbs. Her lambs weigh, one, 105 lbs., the other, 105 lbs., and were 3 months 24 days old when weighed; the ewe shearing 15 lbs. No. 3 lamb, 3 months 4 days old, weight 110 lbs.; No. 4 yearling ewe, 142 lbs., sheared 16⅓ lbs.; No. 5 yearling ewe, 150 lbs., sheared 16 lbs. The yearlings were one year old, May 1st., 1876.

If any of the readers of the RURAL, or Messrs. SWEET & BROWN, can beat them I would be pleased to hear from them through the RURAL. Inclosed please find specimens of wool.

A SUBSCRIBER.

[Samples of wool received. Were extra choice in quality and length.—ED. RURAL.]

ADMINISTERING MEDICINE TO SHEEP.—Place a piece of wood in the mouth so as to hold it fully distended, and confine it there by tying the straps over the back of the head. By holding up the head of the sheep and inserting a horn or tube through a hole in the wood, fluid can be poured into the throat without difficulty.

The Horseman.

TO CURE RINGBONE.

THE Veterinary Editor of the Prairie Farmer in answering a correspondent as to how to cure a ringbone says:

Procure an ointment composed of one drachm of bimodide of mercury, mixed with six drachms of simple cerate. Shorten the hairs which cover the enlargement, and apply little by little, one half of this ointment, by smart friction. This had better be done in the morning, and the horse kept tied short until evening, that he may not interfere with it. Next morning, by aid of a soft sponge and lukewarm soap suds, wash all off gently, and when dry, anoint the place with a little sweet oil, once a day for two days, then wipe clean with a soft dry rag, and apply the balance of the blister. Proceed as after the first blistering, and thus repeat the blistering four or five times. The horse may then be turned out to grass for a month or six weeks. If after that time, lameness still remains, the blistering may be repeated as before. In recent cases, this treatment will most generally prove sufficient. However, obstinate cases will certainly occur, where it may become necessary to use the firing iron, as a last resort. It should be remembered, that no mode of treatment will ever remove the bony enlargement. All that can be accomplished by treatment is, to allay the existing irritation, and stay the progress of the disease.

CAUSE OF MEGRIMS IN HORSES.

A CORRESPONDENT of the Vetorinarian says that he has been in practice as a veterinary surgeon for thirty years, and he has taken pains to astertain the cause of megrims. On examining the horse's eye immediately after or during the attack, he has found it exceedingly convulsed and acted upon by spasmodic affection of the muscles, a symptom that could not be present if the disease arose from distension of the arterial vessels of the brain. He has never seen a saddle horse affected with this complaint, and all the cases he has seen occurred when the sun was shining brightly, or by moonlight when snow was on the ground.

He had a favorite pony which was subject to megrims. He removed the winkers from the bridle and the pony never showed any symptoms of them afterward. It occured to him then that the reflecting of the sun upon the winkers falling directly on the optic nerve, was the cause of this extraordinary complaint. Since that he has had many patients affected with megrims, and in every case he has ordered the winkers to be removed, or if they were not to have the horse's eyes shaded with a piece of leather three or four inches wide, extending in front from one winker to the other. In every case this treatment proved successful. He feels satisfied, from the symptoms he has always observed in megrims, that the brain is not the seat of difficulty.

GALLED SHOULDERS AND BACKS.

DURING the hard work of seed time, farm horses are, in some seasons more than in others—in wet and warm seasons—subject to galled shoulders and backs, which when not attended to, are apt to produce troublesome sores. The skin is not only abraded by the collar and saddle, but irritated and inflamed; and if the irritation is kept up, an ichorous discharge takes place, which is difficult to heal without giving the horse rest. When a saddle-gall is observed, the harness should be looked to, and the pressing points which have caused the sore should be relieved. A lotion should then be used to anoint the bruised parts every night, after they have been washed with warm soap-suds, and dried with a soft cloth. The following is a useful application:—Take hot lime shells of the bulk of two quarts, and pour upon them two quarts of cold water; and after they have intimately combined, pour off the liquid into a dish. Add to this liquid five wineglassfuls of linseed oil and two ounces of fine powdered sugar of lead, dissolved in a little water. Stir them together, and then bottle and cork up for use. After the bruises have been washed in the evening, anoint them with this liquid with a feather until the wounds heal.

LINIMENT FOR HORSES.

R. S. STEELE writes to the American Farmer's Club:—"Some time ago I was a good deal worried with a couple of horses which had sore backs. I tried various remedies without success, and was beginning to despair when the following receipt came to my notice:—'The inner bark of white oak bark boiled down in an iron kettle (never use a brass one) until it is as black as ink; while boiling drop in a piece of alum about the size of a hen's egg.' This liniment is to be applied with a sponge, and is good for any sore or bruise; in fact it is a safe thing to keep in one's barn ready to use when occasion requires. As I found this so useful, I venture to send it for the benefit of others who may not be in the possession of anything as good. I think it is also an excellent plan in warm weather to clean the collars often with castile soap."

TO KILL BOTS IN HORSES.—A teaspoonful each of alum and copperas, pulverized fine and then put into one pint of cider vinegar, it is said, is a sure remedy for bots, giving relief to the animal in less than ten minutes.

The Vineyard.

THE GRAPE PHYLLOXERA.

THE *Phylloxera*, or grape louse as it is generally called, seldom attacks the leaves of our ordinary varieties especially those belonging to the

Vitis Cabrusca species, such as Isabella, Concord and Catawba, but its favorite for leaf-gall work is the Clintons, upon which it is frequently found. The galls produced are very minute and scattered irregularly over the surface as shown in the accompanying illustration. These galls contain the larvæ or full-grown lice, which are supposed to pass from the leaves to the ground and there attack the roots. We make this brief note of the *Phylloxera* for the purpose of calling the attention of our readers to the gall-producing form of this pest, the present season, noting upon what particular variety of grape it appears. If galls are found upon other sorts than the Clinton, we should be pleased to receive specimens of the same, as in our own grounds no other varieties are attacked, or at least have ever shown galls upon the leaves.

THE GRAPE, AGAIN.

THERE are so many ways of cultivating the grape, published in different periodicals, that one gets perfectly bewildered.

Having just read an article in the RURAL, copied from an English paper, and indorsed as your sentiments, I am constrained to enter my protest against such a barbarous treatment of summer pruning.

I tried the plan for several years, and, as a result, had a great crop of half ripened, imperfect fruit—whole bunches of which entirely decayed during the process. As an experiment, I adopted the reverse plan of leaving the entire growth of the summer, after having, when the buds started in spring, rubbed off the smallest twin bud, also any other buds less than 6 or 8 inches apart. This does not allow an over-abundance of vine, or any matting of the leaves to hinder the circulation of air and light. The finest ripened fruit is always partially excluded from the rays of the sun.

I am well satisfied, from the fully-matured and perfect bunches and the delicious sweetness compared with close pruned vines—that every leaf and branch is needed and I carefully save every shoot that has grapes upon it. If any shoots are weak and unfruitful I remove them.

My practice is to trim in autumn after the first hard frost. I remove the old wood much as possible leaving 6 canes of present summer's growth which are the largest and most thrifty, and as near the base of the vine as can be found. These canes are shortened to a distance of 8 or 10 feet and tied to the wire trellis, right and left. All of the other wood is cut out, being probably fully nine-tenths of that which is on the vine.

This comprises all of the triming needed for the whole year, with the exception of removing the extra buds in spring. Of course we go through the vineyard often to see if any thing is amiss, and to admire the magnificent bunches of fruit as they are growing, but we scrupulously avoid handling them, as Dame Nature has provided a delicate bloom for a covering, which if rubbed off destroys the luscious ripening process.

We have tried this way of pruning for 5 years and never yet failed to have an abundant, well-ripened crop. A fruitful vineyard of choice grapes is one of the superlative comforts of home life. A SUBSCRIBER.

Chappaqua, July 13, 1876.

Around the Republic.

THE OTHER SIDE OF KANSAS.

THE legends of chivalry furnish the tale of two knights, who quarreled and fought because they could not agree about the color of a shield which (after they had well pommeled each other) they found had its two sides of different colors. Your correspondent from Kansas sees life in the Arkansas Valley on one side only. This side he holds up to public gaze to the exclusion of much that he can not help but know, if he has lived here three years. He and I are neighbors.

I have been here over five years, and if my powers of observation are only half as good as his, I should know nearly as much about this country as he does. It is not because he does not tell the truth that I accuse him, but because he does not tell the whole truth.

He says "Nature has done all that man could wish, etc." and "That we are equally distant from the Atlantic and Pacific." That this country is beautiful has never been denied by any who have seen it. It is reasonably fertile; but 35 bushels of corn or oats per acre is an average crop. Twenty of wheat is considered very fair. We raise fine Irish potatoes; but 100 bushels is the most an acre will yield in its natural state. Garden vegetables come early; but very few grow as abundantly in the most of the Eastern States. For instance, in the East string beans will yield a succession of crops from the same stalk; here, as soon as they come into bearing, they begin to dwindle, turn yellow and die. I have not found an individual, thus far, who has succeeded in raising celery worthy the name. Anything that constant high winds and hot, dry weather will injure will not grow here without extra care. Our great distance from the leading markets in the East and West, prevents us from realizing paying prices for our produce.

Of all those whom I know as citizens here five years ago, probably less than two-thirds remain, and many remain from compulsion rather than choice.

More farming implements are sold than are really needed. Agents are selling on time, and when pay-day comes and the innocent-looking papers which those thrifty farmers signed are enforced to the extent of taking the team or, maybe, the roof that covers his family, then will there be much distress. Money is worth from 15 to 24 per cent. per annum, secured by unencumbered real estate.

His estimate of wages is too high. I have a neighbor who hired himself and two spans of mules at $3 per diem, to travel with a thresher. There is scarcely a family in the East anywhere who work as hard as people do here, that live on fare as scanty and coarse as do the farmers in this valley. PHILO.

WE fear that an earthly Paradise is not to be found even in the far West, however much it may be sought by Eastern people. It is always well to get a glimpse of the shady side of a picture as well as the sunny, and we thank "PHILO." for affording our readers this opportunity.—ED. RURAL.

NOTES FROM ONONDAGA CO.

EDS. RURAL:—The season has been quite wet so far. Grass is a good crop. Potatoes are doing well, but the "beetle" is very troublesome. Apples set full, but are dropping off more than is desirable. In addition the "twig blight" is upon us to quite an extent. Who will give us the cause and cure for this malady? Pears will give a very poor yield. Many pear trees were killed last year by blight, and those left do not seem inclined to bear fruit. There are plenty of cherries for the birds and some left for those who can afford the time to pick them.

Strawberries have been very plenty and cheap; the main crop selling for 7 cents. Those who expected to get rich in one year raising strawberries, will feel somewhat disappointed. The Wilson still stands at the head of the list for productiveness.

Raspberries are looking finely and at this date (July 3d), just beginning to ripen. They promise to be cheap also.

Grapes have set more heavily than usual and are ten days ahead of last year. So much rain causes a rank growth of vines and will (in my opinion) retard the time of ripening. I prefer hot, dry, weather for grapes, especially in the latter part of the season.

Currants are not raised to a very great extent, and those who do grow them must deal heavily in White Hellebore.

Looking over crops as a whole, the year promises to be a very fruitful one and farmers have much to rejoice over. NELSON RITTER.

Syracuse, N. Y.

The Garden.

CABBAGES THAT DO NOT HEAD.

IN your issue of the 15th inst. you have an extract from a contemporary on the subject of the proper treatment of non-heading cabbages; my advice is, Do not have any such.

I have made some experiments on the cabbage crop by the application of a small quantity of sulphate of soda (Glauber's salts) at the rate of 200 lbs. to the acre, sometimes putting it in with the other manure used in preparing the land, and sometimes sprinkling it around the plant before hoeing, applying one-half to three-quarters of a teaspoonful to the hill. The result has always been an increase of more than twenty-five per cent. in weight in good hard heads over and above the portions of the field not so treated. The sulphate of soda is a cheap material even when purchased in small quantity from the local apothecary for experiment—the wholesale price being only 2½c. per lb.; the retail price should not be over 5c. per lb.

The dealers in chemicals and fertilizers sell it in its crude condition at $25 per ton, or 1¼c. per lb. when one barrel or more is purchased. This is as valuable for agricultural purposes as the crystalized article.

The use of this chemical on the cabbage was suggested by observing that the ashes of that plant showed by analysis a large percentage of sulphuric acid and of soda. The acid and the base combine in sulphate of soda in proportion as follows:—Nineteen parts soda and twenty-four parts sulphuric acid. This is without fractions. G. E. W.

CAUSE OF INJURY TO PLANTS FROM FREEZING.

DURING our late visit to his grounds (a report of which was given in the RURAL) Mr. HENDERSON gave the following item of experience:—In October a number of cabbage-plants—lot us say 1,000—had been planted in cold frames—to be kept over winter. About the time that they recovered from the effects of transplantation, another thousand plants were set in an adjoining frame. Before these latter had time to recover, a severe frost occurred. Now it would be supposed that the first thousand—which were erect and vigorous, having started to grow—would suffer less than the second thousand which were still drooping and wilted. Not so—the established plants suffered most. So marked, indeed, was this difference in the effects of the frost upon the two lots of plants, that the first or vigorous lot, were mostly killed, while the wilted lot were unhurt. Hence, Mr. HENDERSON reasons, as the injury wrought to plants by freezing is caused by the distension and disruption of the tissues, the less sap, the less injury.

Industrial Implements,

MACHINERY FOR FARMERS.

THE last twenty or thirty years have wrought a great change in the outfit of a farm. Then the plow, the hoe, scythe and sickle were the leading and most important implements used. Now the outfit of machinery for a successful farmer presents a list of machines that, in the olden time, would have been considered visionary. The mower, reaper, seed-planter, sulky rake, feed cutter, threshing machine, grinding mill, steam cooking apparatus and steam engine are only a part of the modern appliances required. The steam engine is rapidly becoming one of the necessary attachments, and no machine used by farmers is by them so little understood. To buy a poor engine is greater folly than to buy poor horses for the plow, and as we cannot expect that every farmer can be a judge of the steam engine, we would advise him to buy only of manufacturers of known reliability for good work, experience and honest dealing.

State to the manufacturer the duty you will require of it, and let him select the size best adapted to that duty; by so doing, you will avail yourself of the experience and judgment of the manufacturer and make him responsible for the fitness of the machine to the duty required. The engines and machinery made by LANE & BODLEY, Cincinnati, Ohio, are reliable in every particular, and their farm machinery among the best in the market. Their works are large, and completely equipped to turn out any of the class of work made there in the best and most economical manner.

They will send, on application, their illustrated catalogue of steam engines and the report of the Board of Experts of the Cincinnati Industrial Exposition of 1875, showing the comparative merits of different engines tested at that time. Messrs. LANE & BODLEY were awarded Gold Premium, $200, and Gold Medal on their stationary steam engine and $100. gold, on their portable farm engine.

Floricultural.

THE WILD GARDEN IN AMERICA.

By William Robinson, Founder and Editor of the London Garden.

[Concluded from page 58, last No.]

THERE are many phases of wild gardening which I would like to speak of as suitable for America, particularly that on rocks in New England, where they abound, and on river banks, which I noticed so very fine on the Hudson and other rivers; but perhaps the following description of what has been done here in one case will suggest what is attainable with you. It may be as well to explain that OXON is a cavalry officer who hardly knew a plant five years ago. He is heir to a property in Oxfordshire, and happening to meet with my "Wild Garden," then just published, he fancied he could carry out some of the ideas in it, and did so with the result which I will try to describe below. It is scarcely necessary to add that a person really acquainted with hardy plants and their various habitats would possess an enormous advantage over one like OXON. I noticed some parts of his wild garden—the very best parts—shady hollows, with rich leaf soil, entirely unplanted because they could not be seen from the grass drive. They were the very spots where the Trilliums, Blood-root, Maiden-hair Fern and other beautiful American wood plants would have been at home. I saw the garden for the first time on the 27th of May.

OXON had no favorable or inviting site with which to deal; no great variety of surface, which makes attempts in this direction so much easier and happier; little variety of soil, which might enable plants of widely different natural habitats to be grown; only a neglected plantation with rather a poor gravelly soil and a gentle slope in one part, and little variety of surface beyond a few gravel banks thrown up long before. The garden is, for the most part, arranged on each side of a Grass walk among rather open ground between trees on the one hand and rather shady ground on the other. The most beautiful aspect at the end of May of this singularly ungenial spring, which has not allowed the Peonies to unfold here yet, is that of the German Irises, with their great Orchid-like blossoms seen everywhere through the wood, clear above the grass and other herbage, stately and noble flowers that, like the Daffodils, fear no weather, yet with rich and delicate hues that could not be surpassed by tropical birds or flowers. If this wild garden only teaches this effective way of using the various beautiful and vigorous kinds of Iris now included in our garden flora, it would do good service. The Irises are perfectly at home in the wood and among the Grass and wild flowers; I have never before seen them to such advantage. By-and-by, when they go out of flower, they will not be in the way as in a "mixed border," tempting one to remove them, but grow and rest quietly among the Grass until the varied blossoms of another year well repay the trouble of substituting these noble hardy flowers for some of the familiar weeds that inhabit our plantations. In the wild garden the fairest of our own wild flowers may be happily associated with their relatives from other countries. Here the sturdy bell-flowered Scilla (S. campanulata) grows wild with our own Bluebell (S. nutans); the white and pink forms also of the last-named look beautiful here associated with the common well-known form. The earlier Scillas are of course past; they are admirably suited for the wild garden, especially S. bifolia, which thrives freely in woods. The Lily of the Valley did not inhabit the wood before; therefore it was pleasant to thin out some of its over-matted tufts in the borders and carry them to the wild garden, where they are now in fullest beauty. It is associated with its tall and stately relation, the Solomon's Seal, which I never saw to such perfection as in this wild garden, the partial shade suiting it. The Solomon's Seal, which is usually effective when issuing forth from fringes of shrubberies, is here best arching high over the Woodruff and other sweet woodland flowers, among which it seems a giant, with every leaf and stem and blossom full of lines of beauty. The additional vigor and beauty shown by this plant when in rich soil well repays one for selecting suitable spots for it. The greater Celandine (Chelidonium majus) and its double form are very pretty here with their tufts of golden flowers; they grow freely and take all needful care of themselves. The same may be said of the Honesty, the common forms of Columbine, and Allium Moly, an old-fashioned plant, and one of the many subjects at home in the wild garden, and which are better left out of the garden properly so called.

The myriads of Crocus leaves dying off without the indignity of being tied into bundles, as is common in gardens, the dense growth of Aconite and Snowdrop leaves, of colored and common Primroses and Cowslips, suggest the beauty of this wild garden during the past spring. The yet unfolded buds on the many tufts and groups of the numerous herbaceous Peonies promise noble effects in June; so do the tufts of the splendid Eastern Poppy (Papaver orientale), and the Lilies and Sweet Williams, and Adam's Needles, and many other subjects that will show their blossoms above or among the summer grass in due time. One of the most beautiful and free-growing order of plants among those most suitable for the wild garden is the Borago or Forget-me-not Order; among the best of these here at present are the Caucasian Comfrey (Symphytum caucasicum) and red-purple or Bohemian Comfrey (S. bohemicum), which is very handsome here. And what lovely effects from the Forget-me-nots—the Wood Forget-me-not and the Early Forget-me-not (M. dissitiflora)—are here! where their soft little clouds of blue in the Grass are much prettier than tufts of the same kind surrounded by the brown earth in a prim border. Here the pushing of the delicate Grass blades through the blue mass and the indefinite way in which the fringes of the tufts mingle with the surrounding vegetation are very beautiful. The only noticeable variation of surface is that of some gravel banks, which are properly covered with Stonecrops, Saxifrages, and the like, which would, as a rule, have a poor chance in the Grass. Surfaces that naturally support a very sparse and dwarf vegetation are valuable in a garden, as they permit of the culture of a series of free-growing Alpine and rock plants that would not be able to hold their own among Grass and ordinary weeds and wild flowers. One of the happiest features of this wild garden results from the way in which dead trees have been adorned. Once dead, some of the smaller branches are lopped off and one or more climbers planted at the base of the tree. Here a Clematis, a climbing Rose, a new kind of Ivy, a wild Vine, or a Virginian Creeper, have all they require—a firm support on which they may arrange themselves after their own natural habit without being mutilated or without trouble to the planter, and fresh ground free to themselves. In this way the more vigorous of the new Clematises may be grown to perfection. What an admirable way, too, of growing the many and varied species of Clematis: as beautiful as those with flowers as large as saucers. Even when an old tree falls and tosses up a mass of soil and roots the wild gardener is ready with some subject from his mixed border to adorn the projection, and he may allow some choice Bramble or wild Vine to scramble over the prostrate stem. A collection of Ivies grown on old tree-stems would be much more satisfactory than on a wall, and not liable to rob each other at the roots and interfere with each other in the air. Ferns are at home in the wild garden; all the strong hardy kinds may be grown in it and look better in it among the flowers than in the "hardy Fernery" properly so called. Even more graceful than the Ferns, and in some cases more useful because they send up their plume-like leaves very early in the year, are the giant Fennels (Ferula), which grow well here and hold their own easily among the strongest plants. The common Fennel is also here, but it seeds so freely that it becomes a troublesome weed and shows a tendency to overrun plants of greater value. This reminds us of certain subjects that should be introduced with caution into all but the remotest parts of the wild garden. Such plants as Heracleum, Willow Herb, and many others that overcome all obstacles, and not only win but destroy all their fellows in the struggle for life, should only be planted in outlying positions, islands, hedges, small bits of isolated wood or copse, where their effects might be visible for a season, and where they might ramble without destroying. In short, they never should be planted where it is desired to encourage a variety of beautiful subjects. Rabbits—dreaded vermin to the wild gardener—are kept out here effectually by means of wire fencing. The presence of these pests prevents all success in the wild garden. It would be well if one could keep out slugs by the same simple means.

To succeed well with the wild garden, one should have a good collection of hardy flowers from which it can be supplied. OXON has formed an excellent one, consisting of about eleven hundred species, mostly arranged in borders. From these, from time to time, over-vigorous and over-abundant kinds may be taken to the wilderness. In a large collection one frequently finds species best suited for the enjoyment of full liberty in the woods.

I need hardly point out, in conclusion, how agreeable the work of the wild-gardener is, or what a pleasant source of interest and amusement it is to a lover of flowers.

The Garden Office, London, June 4, 1876.

EXCHANGE.

SARAH BARBER, Castalia, Erie County, Ohio, writes:—I was sick when you put your Flower Exchange in the RURAL this spring, and did not know whether I should be able to see to my flowers or not. I will save White Candytuft—Double Rocket Dwarf Larkspur (two colors, pink and purple)—German Pinks (Heddewiggi and laciniatus)—Snapdragon. These I would like to exchange (in the fall) for Double Portulaca—Oriental Poppy—Campanula—Perennial Alyssum—Myosotis—Perennial Linum. We have as nice a bunch of Carnation Pinks as I ever saw; I this morning counted 110 perfect blossoms on it. There are more buds; some have withered and some have been picked; they are a bright scarlet and as double as can be.

FLORICULTURAL NOTES.

Walks, says the Gardeners' Chronicle, should not be hoed. Hand-weeding and rolling in showery weather is the best method and by far the most economical—the process of hand-weeding being formidable in name only.

The following, from the same journal, we have already noted in our Centennial floriculture:

The fine collection of Hollies, Rhododendrons, Conifers and other evergreens exhibited by the Messrs. VEITCH at the Centennial Exhibition has been presented by the firm to the Fairmount Park Commission. The donors gave the British Centennial Commissioners authority to select an institution on which to bestow the gift, and Col. SANDFORD and Prof. ARCHER, with excellent judgment, as the Philadelphia Ledger says, selected Fairmount Park. We trust that the shrubs may long remain as a memento of British horticulture and international good feeling.

Weigelas as Biennials.—M. LEBAS, in the Revue Horticole, advocates a new method of cultivating Weigelas. Observing that the flowers are produced on last year's wood and that the plants have a tendency to produce numerous shoots from the base, he recommends that the shrubs be considered as biennial and that they be cut down after flowering, so as to favor the development of the shoots at the base.

The Naturalist.

CARRIER PIGEONS.

AN interesting lecture on the utilization of the homing or carrier-pigeon was given at the Zoological Gardens, Regent's Park, recently, by Mr. Tegetmeier. After describing the origin of the pigeon *voyageurs*, the methods of training for the long *concours*, or races, the powers of flight, extending to upwards of 500 miles a day, the lecturer described the details of the pigeon post used during the siege of Paris, and stated that at the present time every fortress and fortified town in Germany was provided with flights of trained pigeons by which communications could be sent into a town if invested by a hostile force. He then proceeded to describe the latest application of the homing faculty of these birds—namely, the establishment of communications from light ships to the shore, so that by the use of the maritime code of signals, two or three letters stamped on the wing would convey the intelligence that assistance of any kind was desired, and would provide a means of communication when no other method was available. The experiment is being tried, in the first instance, at Harwich, and as soon as a sufficient stock of birds has been reared, it is proposed to keep relays on board the adjacent lightships, so that in case of a second wreck like that of the Deutschland, requests for assistance could be immediately conveyed to the authorities at Harwich.

BATS AND INSECTS.

WE make the following extract from a recent number of the London Farmer:—In the winter of 1875-76, a large number of dead, and, for the most part, hollow trees in the Thier-garten of Berlin, were felled and cut up for firewood. As a consequence of this measure, many thousands of bats, hybernating in these natural retreats, and awaiting the return of spring to renew their energetic campaign against insect vermin, were necessarily destroyed. It is needless to point out here the great utility of these harmless little creatures; any one possessed of the slightest smattering of natural history must be well acquainted with the fact. The question to be considered is how such a needless destruction of useful animal life may be best avoided. Numerous observations have fully shown that bats in a state of hybernation can endure any degree of cold without injury; but that if once disturbed while in this state they are extremely susceptible to change of temperate, and but rarely survive the disturbing intrusion on their sleep.

Baron Nolde writes to a German contemporary, suggesting that such trees as form the resting place of bats should be felled only in the warm months of the year, while their inhabitants are in a state of activity, and able to seek fresh shelter for themselves. The only objection in this place he can anticipate is, that labor is more easily and cheaply procured in the winter than in the summer months. But granting this, it by no means follows that felling such trees in winter is in the long run the cheaper plan. The importance of the bat in the economy of nature has not been properly recognized. He cites the case of a forest belonging to the Crown in illustration of this point. Well-grown oak trees being required for naval purposes, a notice was issued that none should be felled until the receipt of special orders. Long after the trees had arrived at maturity, the notice remained unrevoked, and they were suffered to run on to a state of decay. This being reported to the higher authorities, orders came to cut down the trees for firewood. The work was undertaken in the depth of winter; thousands upon thousands of hybernating bats died from disturbance and exposure, and the ultimate result was the total destruction of the whole forest, for in the second year after their extermination the damage done by caterpillars—which up to this time had never been specially remarkable—attained such an enormous development as to render the felling of the whole plantation the only practicable course to be pursued.

PINE TREE PRODUCTS.

THE pine forests of Europe are utilized to a considerable extent. There are two establishments near Breslau, in Silesia, one a factory where the pine leaves are converted into what is called "forest wool" or wadding; the other an establishment for invalids, where the waters used in the manufacture of this pine wool are employed as curative agents. Two cases of these products were shown at the last Paris and Havre Exhibitions, which contained various illustrations in the shape of wool for stuffing mattresses and other articles of furniture (instead of horse hair), vegetable wadding and hygienic flannel for medical application, essential oil for rheumatism and skin diseases; cloth made from the fiber; articles of dress, such as vests, drawers, hose, shirts, coverlets, chest preservers, etc., and other useful applications.

For the preparation of the textile material, an ethereal oil is produced, which is employed as a curative agent and as a useful solvent. The membranous substance and refuse are impressed into blocks and used as fuel; from the resinous matter they contain, they produce sufficient gas for illuminating the factory in which the manufacture is carried on. We have seen garments for sale in this city said to be made from the spines of the pine, and recommended for the cure of rheumatism.

STRANGE INSTANCE OF FELINE AFFECTION.

A LIVERPOOL gentleman, who visits Oldham occasionally, states that a curious incident occurred the other day at a gentleman's house in that town. A cat belonging to the house had recently given birth to three kittens, two of which it was found necessary to drown, and the mother was left with only one. About the same time two chickens, just hatched, were placed in a basket on a table and covered with a piece of flannel. Shortly after they were put there one of the chickens was missed and for a long time could not be found, but ultimately, to the surprise of every one, it was discovered snugly nestled with the remaining kitten in the soft fur of the cat, and chirping with evident satisfaction. It was removed to its basket and a watch set upon the cat, which, after a while, was seen to go to the basket, gently lift out the chicken by the down and feathers at the back of the neck, jump off the table, and carry it away to where the kitten was, without hurting it in the least. This instance of ultra-natural affection is the more remarkable because on ordinary occasions the cat is a savage one, and has a bad reputation for destroying chickens, pigeons and other birds, in the neighborhood.

THE ORANGE INSECT.

ORANGE eaters may be glad to know that the insect found beneath the small brown scales on the rind of the orange is a species of coccus—a tribe of insects allied to the well-known cochineal, and the scale is the cast skin of the larvæ. Underneath this shelter the insect may be found in various stages of growth, its different metamorphoses being gone through without any change of position. Sometimes the scale conceals a group of eggs in the process of hatching, sometimes larvæ more or less developed; in other cases it covers the perfect insect, in which the sexes are widely different, the male being furnished with ample wings, while his less favored spouse is evidently destined for a sedentary life at home. The insect was noticed and described by the late Mr. Richard Beck, in 1861, in the "Transactions of the Royal Microscopical Society," and the description, with a plate of the metamorphoses given in The Quarterly Journal of Microscopical Science, Vol. I., new series. These insects are easily obtained, though not on every orange.

Domestic Economy.

CANNING AND PRESERVING IN OUR GRANDMOTHER'S TIME.

Doubtless many of the readers of the Rural New-Yorker have an idea that the preserving of fruits, meats and similar articles, in what is termed a natural condition, is something new, or belonging entirely to the present generation. It is certainly true that such things have come into more general use within the past fifteen or twenty years than ever before, besides, much has been learned in regard to the manipulation of the same, in order to be perfectly successful, still there were no secrets connected with the various processes, even in the beginning of the present century, as we will endeavor to show from an old work on the subject published at the period named. For instance, much has been said about the great discovery of Gail Borden in condensing and preserving cream and milk. But let us see what the author of our old book says about it:

Preserving Cream.—I took five *litres* of cream, taken with care from milk of the preceding evening. I condensed it in the water-bath to four *litres*, without skimming it. I took off the skim which was formed above, in order to strain it through a boulting cloth afterwards, and let it cool. After having taken off the skim which had risen while cooling, I put it in half bottles, observing the usual process, and let the water-bath boil for one hour.

At the end of two years this cream was found as fresh as if prepared the same day. I made some good fresh butter with it; making from four to five ounces of butter from half a *litre* of cream.

Green Peas.—The *clamart* and the *crochu* are the two kinds of peas which I prefer, especially the latter, which is the most juicy and sweet of all, as well as the earliest, except the *michaux* (Hastings), which is the first pea, but this kind is not fit to be preserved. I gather the peas when they are not too young and tender, for they are apt to dissolve in water during the operation. I take them when they are of a middling size. They are then in a more perfect state, and have an infinitely finer taste and flavor. I shell them as soon as they are gathered. I separate the large ones, and they are then put in bottles, the bottles being for that purpose placed on the stool before mentioned, in order that as many peas as possible may, by shaking the bottle, be made to go into them; I then cork the bottles, etc., and put them in a water-bath, which is made to boil for an hour and a half, if the season be cool and moist; and two hours in a dry and hot season; and I terminate the operation as before.

I also put in bottles the larger peas which I had separated from those which were more delicate. These, also, I put into the water-bath, which I let boil according to the season, two hours, or two hours and a half.

Pears.—When the pears are peeled and cut into quarters, and the pips with their husks are taken out, I put them into bottles, etc., in order to place them in the water-bath. I carefully attend to the degree of heat they have to receive, which, if they are of a kind usually eaten raw, should not be more than sufficient to make the water-bath boil. When the preserve consists of pears usually stewed or bolted, then I let them remain boiling in the water-bath five or six minutes. Pears which have fallen from the tree require a quarter of an hour's boiling, etc.

Chestnuts, Truffles and Mushrooms.—I pierce chestnuts at the point with the point of a knife, as if I meant to roast them. I put them in bottles, and give them one boiling in the water-bath.

Having well washed and brushed the truffles, in order to take away all the soil, I cut off the upper part gently with a knife. Then I put them into bottles, either whole or in pieces, according to the diameter of the neck. The remainder I put in bottles apart. The whole being well corked, etc., I put them in the water-bath to receive an hour's boiling, etc. It is not necessary to recommend that the truffles should be sound and recently gathered.

I take Mushrooms fresh from the bed, well formed and firm. Having peeled and washed them, I put them in a saucepan on the fire, with a piece of butter or some good olive oil, in order to make them eject their liquor. I leave them on the fire till this liquor is reduced one half. I withdraw them in order to let them grow cool in a pan; after which, I bottle them and give them one good boiling in the water-bath.

Broth, or Jelly.—I composed this jelly according to the prescription of a physician, of calves' feet and lights, red cabbage, carrots, turnips, onions and leeks, taking a sufficient quantity of each. A quarter of an hour before I took this jelly from the fire, I added some sugar-candy with some Senegal gum. I strained it as soon as it was made. After it was cold it was put in bottles, which were corked, tied, wrapped up in bags and put in the water-bath, which was kept boiling one quarter of an hour, and this jelly was preserved and remained as good as it was the day on which it was made.

HOW TO COOK SPRING CHICKENS.

It is generally conceded that chickens merely split open and broiled, are dry and unsavory eating. I, therefore, give to the housekeepers of the Rural my recipe, which has been pronounced good by many. Clean the chickens nicely; cut them down the back; break the breast bone; wash, and wipe them dry; season them, both in and outside, with salt and pepper; place them in a dripping-pan with a little water; put it in a quick oven until they are a delicate brown on both sides; baste them frequently with butter; renew the water as it evaporates. When the chickens are done, remove to a hot dish; add a little more water and a teaspoonful of flour to form the gravy. Serve the gravy in a sauce-tureen, or in the dish with the chickens.

Mrs. Rustic.

SELECTED RECIPES.

Fish Fritters.—Take the remains of any cold fish; remove all the bones; add bread crumbs and mashed potatoes in equal quantities. Mix half a teacup of cream with two well-beaten eggs, a pinch of salt and pepper; beat all together; cut into small cakes and fry in boiling lard. Serve hot.

Corn Fritters.—Take half a dozen ears of sweet corn, grate it from the cob as fine as possible; three well-beaten eggs; a tablespoonful and a half of flour; season with pepper and salt; melt equal portions of lard and butter in a frying pan; when boiling hot, drop in the mixture, a spoonful at a time. Fry brown, and send to the table hot.

Squash Fritters.—One pint of cooked squash; one pint of sweet milk; two eggs well beaten; a little salt, and sufficient flour to form a stiff batter; fry in boiling lard. Work a teaspoonful of baking powder thoroughly through the flour.

Knuckle of Veal with Green Peas.—Three pounds of veal; one quart of water; bring it slowly to a boil; take off all the scum with great care. When it has simmered for an hour, add a quart of green peas, and season to taste.

Hygienic Information.

REPLY TO "DIETETIC HERESIES No. 2."

The time is past when one can convince by bare assertion, however frequently repeated, and the race of men who can prove a theory without giving reasons, has become extinct. The idea of injury from sleeping on a full stomach, or during digestion, is, I think, of modern origin. I certainly never heard of such a thing in my youth; the whole family of nine, of which I was one, ate supper and went to bed, the women frequently, if not generally, left the dishwashing till morning. In my former article I mentioned that many changes of opinion on the subject of hygiene, and in the treatment of disease, had taken place within the past fifty years, some of which I will now mention, and as I cannot do better, will quote from an article written six years ago by one who has made the laws of health a life study.

"I know it is claimed by the most orthodox physicians that diseases change with time, with latitude and with age. I know that certain diseases are peculiar to certain climates, districts and temperaments, but I am convinced that diseases do not change half as much as the fashions of their treatment—I say fashion, for what else can I call it? Fifty years ago, physicians prohibited cold water in fevers. Whoever of the faculty prohibits it now would be amenable to malpractice. Forty years ago, bleeding was the first and most reliable remedy for interual inflamation: now for the same diseases, by the same orthodox physicians, the same treatment would be sapping the foundations of life. Forty years ago we were told that we ate too much: now the same faculty claim that many of our diseases are the result of insufficient food. Forty years ago we slept too much: now we are cautioned against insufficient sleep. In our childhood we were encouraged, for the benefit of our health, to rise early: now we are advised not to rise before the sun, not because it bespeaks ill manners, but because that when he rises he dissipates the germs of agues, chills and cholera. Fifty years ago, where fruit was plenty, one-half of juvenile ills were the effects of eating fruit: now, where fruit is scarce, three fourths of the same ills are for the want of it. I set down naught in malice. I am convinced that the science of medical treatment is progressing, and that these changes are mainly for the better, and I honor the medical faculty for inaugurating them, but I warn them that there are other changes to be made, and other teachings to prevail, before medical science becomes perfect, or the Goddess Hygia shall rule supreme."

I make these quotations not by the way of proof of the correctness of my position, but to show that however popular an opinion may be, it is liable, in the course of time, to turn out an error. What are the reasons given against sleeping during digestion? Surely the charges of "error, bad advice, untruth, subterfuge and nonsense" are not reasons, nor did I ever see or hear a reason that had the influence of a feather's weight, to hinder me from taking my best-relished meal, or lunch, at 9 to 10 P. M. and going at once to bed and to sleep. The charge of heresy I admit. Why not? Galileo was a heretic of the rankest kind. Columbus was a heretic. The whole list of Protestant churches was a string of heretics.

Friend Barker, you are right in not being convinced by the citation of individual cases. They do not prove a generality. By them we can only prove that there may be exceptions to sweeping rules. Statistics gotten up with care and precision, are good proof in drawing conclusions of health and longevity as affected by occupations and habits. But in the statistics you mention, I think you are wrong in classing farmers as laborers, as they are in the census classed separate. I quote from the Genesee Farmer of 1858, which I think is good authority:

"That the life of the farmer is healthful, has frequently been shown by tables of comparative longevity, and one of these for Massachusetts shows that their lives exceed the general average by twelve years, and go nearly nineteen years above that of the common laborer, and eighteen above the average of those engaged in mechanical pursuits.

A most appropriate question to raise in our own minds in settling for ourselves this matter is, what are the natural instincts of man in relation to the times of eating and sleeping. As to the first, there can scarcely be a doubt that it is when nature calls, neither can the fact be questioned that man feels less inclined to action after eating a full meal.

Heat is to the animal the great source and pabulum of life and action. When the stomach has work to do, it calls away from the brain, muscles and lungs a portion of their heat, and the consequence is less inclination to voluntary action and increased inclination to sleep. Then the brain and voluntary muscles rest, the lungs and heat slack up, the inspirations and pulsations are less frequent.

In reply to "Dietetic Heresies No. 3," which has just reached me, I will add that I am well aware that quotations favoring friend B.'s position might be added to infinity, and that his is the popular side of the question at this time. Nevertheless there are strong indications of a change in popular sentiment on this and some other matters relating to health.

If friend B.'s own case is in his favor as he reports it in one of his articles, mine is also in mine. Laboring with both brain and muscle for fifteen years, I ate very little meat in the morning, none afterwards till 9 P. M., just before going to bed. Since then, with less effort of brain, I have eaten meat at noon, but often more at 9 P. M. This was not an experiment with me. I had, since my boyhood, boarded in a fashionable manner for years; but when I became a householder, the change was made from a deep conviction of its propriety, deduced from a study of animal physiology and an observation of the instincts of nature, and its correctness has, in my own mind, become proved and substantiated by practice. I have been out in the open air every day for the past fifty-six years, never had a symptom of dyspepsia, and now challenge any man of my age, 71, to run a race with me.

Muskegon, Mich. S. B. Peck.

CARE OF THE HAIR.

A writer in Harper's Bazar says: To get and retain beautiful hair you must attend to daily brushing it, occasionally washing it, and periodically trimming it, and striving at all times to keep the general health up to the average.

Now as to brushing. The skin of the head, like that of every other part of the body, is constantly being renewed internally, and these are removed by means of the body brush. But it is not so easy to brush the hair as one might imagine. Few hair dressers, indeed, know very much about it. The proper time for the operation then, is in the morning, just after you have come out of your bath, provided you have not wetted your hair. Two kinds of brushes ought to be found on every lady's toilet table, a hard and a soft. The former is first to be used, and used well, but not too roughly; it removes all dust, and acts like a tonic on the roots of the hair, stimulating the whole capillary system to healthy action. Afterward use the soft brush—to give the gloss, from which the morning sunshine will presently glint and gleam with a glory that no Macassar oil in the world could imitate. Whence this gloss? you ask. Why, from the sebaceous glands at the root of the hair, nature's own patent pomade, which the hard brush does not spread.

Secondly, one word on washing the hair. This is necessary occasionally, to thoroughly cleanse both head and hair. One or two precautions must be taken, however. Never use soap if you can avoid it; if you do, let it be the very mildest and unperfumed. Avoid so-called hair-cleansing fluids, and use rain water filtered.

The yolks of two new-laid eggs are much to be preferred to soap; they make a beautiful lather, and when the washing is finished, and the hair thoroughly rinsed in the purest rain water, you will find when dry that the gloss will not be destroyed, which an alkali never fails to do. The first water must not be very hot, only just warm, and the last perfectly cold. Dry with soft towels—but do not rub till the skin is tender—and afterward brush. Be always careful to have your brushes and combs perfectly clean and free from grease, and place other brushes on the table for friends of yours who happen to be Macassarites.

Pointing the hair regularly not only prevents it from splitting at the ends, but renders each individual hair more healthy and less attenuated—if I may apply the term to hair—and moreover, keeps up the growing process, which otherwise might be blunted or checked. Singeing the tips of the hair has also a beneficial effect.

It will be seen that I am no advocate for oils and pomades. My advice in all cases is to do without them if you possibly can, for by their clogging nature and overstimulating properties they often cause the hair to grow thin and fall off sooner than it otherwise would. Let well alone.

One word in conclusion, about dyes. Avoid them if you be your own friend. Hair dyeing is very satisfactory, as far as dead hair is concerned, but on the living head its perfect success is a chemical impossibility. As to hair restorers, those are not simply stainers, but depend upon the action of the light, chemically altering and oxidizing the application after it has been used—their incautious use, I must add, is fraught with great danger.

NEURALGIA AMONG WOMEN.

A physician of a London hospital writes to the British Medical Journal:—"There is no recognized reason why of late years neuralgia of the face and scalp should have increased so much in the female sex, as compared with our own. There is no doubt that it is one of the most common of female maladies, one of the most painful and difficult of treatment. It is also a cause of much mental depression, and leads more often to habits of intemperance than any other. This growing prevalence to neuralgia may to some extent be referred to the effects of cold upon the terminal branches of the nerves distributed to the skin; and the reason why men are less subject to it than women may to a great extent be explained by the much greater protection afforded by the mode in which the former cover their heads when they are in the open air. It may be observed that the surface of the head which is actually covered in man is at least three times that which fashion allows to women; indeed, the points of contact between the hat or bonnet and the head in the latter are so irregular as practically to destroy any protection which might otherwise be afforded.

CURE FOR EPILEPSY.

A writer in the Cincinnati Gazette recommends a cure for epileptic fits which he has proved himself, after suffering more than twenty years. The following is the remedy:—Take of bromide of potassa two and one half ounces, dissolved in one pint of rain water. Dose, a teaspoonful three times a day, before eating. Should your throat become sore, weaken it. If it should make you dizzy-headed, reduce the dose. Some constitutions will not bear it as strong as others. There is no danger in the above remedy if you are careful.

Infected Clothes.—A correspondent of the Manchester Guardian warns readers of the danger of ordering clothes from tailors whose workmen work at their homes, where contagious disease may be raging. Recently a friend ordered a suit of clothes from a Manchester tailor, and soon after he had begun to wear them symptoms of scarlet fever appeared. He found that the journeyman who had made up his clothes had scarlet fever in his house at the time.

Treatment of Burns.—In the treatment of burns in the Charity Hospital, New York, when of a superficial character, a preparation consisting of two parts of collodion and one of olive oil has been found to be very efficacious. When the burn is of an extensive character, gasoline proves of decided benefit. The advantage of gasoline is that it is of the right consistence, and does not become rancid.

A NEGLECTED SOURCE OF WEALTH.

WITH all our boasted progress in the various industrial pursuits, succeeding generations will doubtless marvel at lack of industry and gross stupidity. This may not be a pleasant view to take of our situation or be very complimentary to the general intelligence of those upon whose inventive genius and labors the nation depends for its stable wealth. Still, while we may not be able to discover our own shortcomings, those who come after us surely will, however much we try to avoid leaving what are termed the great works of the age incomplete.

If there is any one industry in which, as a nation, we take more pride in than another, it is in the development of our natural resources; and while we have good reasons to be proud of what has been done in this direction, there is still room for regret that some have nearly or quite escaped notice or serious attention. One of the most prominent of these is the almost total neglect of employing the water in our thousands of brooks, ponds and rivers for irrigating purposes. Here is a source of wealth which might be made to yield greater returns than all the gold and silver mines of the Continent, but for the lack of proper appreciation or skill to employ it, this incalculable source of wealth is permitted to pass by our very doors in its idle meanderings from mountain tops to the sea. There is scarcely a season passes at some period of which a severe drouth does not occur, when an abundance or even a small supply of water applied artificially to the land would not insure a bountiful crop; and while every farmer and gardener will admit this to be true, there seems to be a general apathy among this very class of our people in regard to this subject of irrigation.

It is true that we do occasionally hear of an instance of low meadows being flooded and the enormous yield of hay gathered therefrom in consequence; but their numbers are so few as to be scarcely worthy of record. We are reminded at this time of an extensive region of country adjacent to this great city of New York and extending to the northwest fifty or more miles, which is now suffering from one of the severest drouths ever known. Crops of all kinds have been cut short, gardens and lawns burned up, and ornamental trees and shrubs dying by the thousands—all for the want of a little moisture; and still there is not naturally a better watered region in the country than this one to which we refer. A man can scarcely travel a mile in any direction without crossing small and large never-failing streams; but we doubt if a single attempt has ever been made to utilize the water in these brooks for irrigating purposes.

The land lying contiguous to these streams could, in many instances, be irrigated by taking the water directly therefrom and distributing it in ditches; but where it is needed most is upon the high ground, where it cannot be taken without more or less expense in the way of pipes and power for elevating it; but the cost of these is really of but little moment when compared with the benefits derived therefrom.

A wind-mill is probably the cheapest power known for this purpose, costing scarcely anything for attendance when once put in position and, if properly constructed, very little for repairs. There are few localities where there is not wind enough to pump all the water required for ordinary purposes, provided a good, capacious reservoir is furnished to hold the surplus raised at times when artificial applications of this element were not required.

More than one farmer and gardener have said to us during the drouths of the past half dozen years, that their losses in a single season would more than pay for the cost of the necessary apparatus to irrigate their entire land; but they continue to defer the preparations for preventing such losses in the future, vainly hoping for more favorable seasons.

There is more gold in the little streams which are found in such abundance throughout the Eastern States than in the gravelly beds underlying those of the Rocky Mountain regions; and what is more, it will cost a far less sacrifice of health and capital to obtain it; but we can do little more than to tell where it is to be found, leaving the collecting to those who possess the requisite skill and facilities for drawing upon this inexhaustible source of wealth.

FOLLOWING A LEAD.

A CORRESPONDENT of the N. Y. Times, writing from Philadelphia about the opening of the Centennial Exhibition, reports the remarks of one of the German officials who expressed surprise at the appearance of the crowd:—"Mein Gott! One hundred thousand people and no peasantry!"

He is not an exception. The difference in appearance between an American and a European gathering is apparent to all. When JENNY LIND rode from the steamer to her hotel that bright Sunday morning of her arrival in America, the throngs that crowded around the carriage attracted her attention. "Mr. BARNUM," said she, "I see no poor people."

A German friend of ours, who came some years since, said that which struck him as most singular when he passed across the Battery was, that the drivers of the carriages in waiting, almost without exception, wore white shirts and were reading newspapers. It is certainly a thing of which, as a people, we may be proud, that there are no classes and but few individuals, who are so far down in poverty as to be unable to dress decently.

But among the crowd in Philadelphia there were peasants—farmers, mechanics, day laborers—all honorable men and respectable citizens, neither better nor worse on account of their avocations. For the day they laid aside the hoe, the hammer and the hod, and donned their best apparel, all of which, we venture to say, was paid for. These are not the classes that make tailors' bills.

But he who in an American crowd or in any American society undertakes to judge of a man's position from his dress, makes a mistake. Our people do not take the advice given by one of SHAKSPEARE'S characters, "Costly thy raiment as thy purse *affords*," but make their dress rich and expensive without regard to the purse and whether they can afford it or not. At church, in society, on the street, the millionaire and the man not worth a penny in the world are dressed alike. The wives and daughters of men who are living on their incomes wear no finer silks and no more expensive jewels than do those of men of moderate means, much of whose earnings and profits are all spent for useless extravagance.

It is fact so patent, it requires no argument; we all see it every day. And the corollary—the direct inference is that too much money is spent in this country on dress. But who shall say what one may or may not wear? Shall the miller always wear white and the farmer gray, and the gardener blue clothes? We are not advocates for uniforms for the different professions, trades or classes; nor would we limit the price that should be paid for dress. The advice in the quotation given above is sound; let every man dress as he chooses if his purse affords it. There are, however, only a few who dress in accordance with their own ideas of the fitness of things; fashions must be followed as nearly as may be, and what another wears is an example for us. We imitate when it is both useless and foolish and strive to do as others do when we need the money we might save for other purposes.

These remarks we make about dress may, with propriety, be applied to almost every department of living—houses, furniture, ornament, food. There is too much striving to ape the habits of those who have more money than we have, and it is this aping—spending money for things not necessary because somebody else has them—that keeps so many in comparative poverty. There is no country in the world where the common people can obtain a good living for so little labor as in this; and when we begin to spend our money for what we need only, instead of for what we want, from that moment we shall begin to accumulate what will feed and clothe us and ours when we have arrived at an age that we should be excused from further labor.

To secure this end, a good supply of will power is necessary. It is not an easy thing for a man—and it is a harder one for a woman—to declare independence and not be governed by what *they* wear, or have, or do, or say. But such declaration is necessary in many cases. And there are but few, and that few not worthy of notice, who will not at heart commend the action of those who endeavor to regulate their expenses with due regard to their income. If there is one class of our readers to whom more than to another, we would impress these ideas, it is the young—those whose habits are yet to be formed and the formation of which is of the utmost importance to them. Their motto should be, "Economy and Frugality," and they should ever bear in mind the remark of Mr. MICAWBER:—"An income, twenty pounds, an expenditure, nineteen, nineteen, six, result happiness; an income twenty pounds, an expenditure twenty nought six, result, misery."

RURAL NOTES AND QUERIES.

The Thirty-Sixth Annual Fair of the N. Y. State Agricultural Society will take place at Albany, Sept. 11–15, this year. Some have expressed the opinion that the Centennial Exhibition will largely contribute to the scarcity of exhibitors for 1876; but we are satisfied, from conversations with many of the regular and new exhibitors, that this Fair would not be missed by them on any account. Its popularity, which is increasing every year, is probably due largely to the liberal treatment to be relied upon from the heads of the various departments as well as the certainty of a crowd of visitors during the time the Fair is open. Copies of the Premium List and blanks for entries, can be had by addressing "State Agricultural Society, Albany, N. Y." Early entries are safest and best.

Depreciating Value of Silver.—Not long since everybody seemed to be anxious to have silver circulate as of old, most persons having become tired of the far too often filthy paper fractional currency. But now that silver has become abundant it depreciates in value, and for aught we know it may soon not be worth as much as old iron. It is a clean and good-looking circulating medium however and not likely to burn up or blow away, and for our part we like the change, having had enough of rags and nickel. But if silver is to be thrown out of use because of its abundance, why may not gold meet the same fate at some future day. It is difficult to say what may happen, still we hope even our financial Gods will not deprive us of a good hard currency that can be made to jingle when one needs such music.

Protect the Purchaser.—Of late there has been some discussion in the Rural Press in regard to the subject of patenting new fruits and plants in order that the originator may derive more benefit from his production. This may be quite correct from the producers standpoint, but it seems to us that the purchaser very frequently needs more protection in order to prevent being swindled, when buying new and untried sorts. Perhaps the two might be combined, and the originator be compelled to submit his productions to rigid trial before disposing of any stock and the public warned against purchasing new plants until they had received the endorsements of commissioners appointed to investigate and report upon the same.

Small Fruits at the Centennial.—From what we can gather out of the reports made by the committee appointed to examine the fruits shown at the Centennial, the exhibit is very mean indeed and would not be creditable to a country town. The show of small fruits, such as strawberries and raspberries, seems to have been confined to a few new seedlings, of no especial merit, in fact a greater variety and a better show can be seen almost any day in the market stalls of our larger cities and villages. Why this neglect of the Great Centennial by our fruit growers is something we do not pretend to understand, but the fact is painfully apparent.

"Political Duties."—An esteemed correspondent takes exception to our leader of last week on the above named subject, and as we believe in giving both sides of all questions of importance, his very able reply will be found on page 72. It is however, but fair to state there is really no difference of opinion between ourselves and L. A. R., the point taken is mainly in the manner of expressing it.

RURAL BREVITIES.

THE spicy letter of our Centennial correspondent "SHORTHORN," came too late to appear in full this week but the remainder will be given next week, with some additional interesting matter on the same subject.

A NEW and heretofore unknown pest is reported to have appeared among the orange groves of Southern California. It is supposed to be a species of plant lice, and attacks the roots, causing the death of the tree.

THE "Wheat-head Army Worm" *Leucania albilinea* is said to be quite plentiful in some parts of Kansas and doing considerable injury to wheat. It attacks the heads of wheat and rye, eating out the soft kernels leaving the chaff empty.

THE physiologists have at last come to the conclusion that long life in man is not the result of any particular care which persons take of themselves but it is hereditary, the decendents of METHUSELAH standing far the best chance for a long time.

COLTON & Co., 172 William St., New York, have just issued a fine Map of Turkey, which will be of great service to those desiring to read understandingly the accounts of the war now going on. They will send copies by mail on receipt of twenty-five cents.

NOTHING gives us greater pleasure than to chronicle the enterprise and good judgement of a contemporary. The Illustrated Weekly, July 15, gives a taste of this quality that should be a cause of just pride to proof reader and publisher, not to mention the artist who *composes* the pictures. For instance on the first page is a portrait of "The late Brigadeir General G. A. CUSTER," while the biographical notice tells about the achievements of "Major General CUSTER." On the last page is a spirited picture of "Yachts off the Long Island Coast in a Squall." The yachts are *all* of the English Cutter model, of which we have but *one* example in our whole fleet, and in transferring and adapting the picture from an English periodical, the artist has omitted to haul down the English flag and substitute American colors in their stead. With these trifling exceptions the picture is as perfect as if drawn by a special artist on the spot. Again we say such intelligent enterprise is beyond the power of words to praise.

BUSINESS NOTICES.

HUNDREDS of testimonials, from all sections where the **"Phœnix" brand Pure White Lead** has been sold, certify to its great superiority over all other paints.

THE HEN AND THE HONEY BEE.

A LAZY hen—the story goes—
  Loquatious, pert, and self-conceited,
Espied a bee upon a rose,
  And thus the busy insect greeted:

"Say, what's the use of such as you,
  (Excuse the freedom of a neighbor,)
Who gad about and never do
  A single act of useful labor?

"I've marked you well for many a day
  In garden blooms and meadow clover;
Now here, now there, in wanton play,
  From morn to night an idle rover.

"While I discretely bide at home
  A faithful wife—the best of mothers,
About the fields you idly roam
  Without the least regard for others.

"While I lay eggs, or hatch them out,
  You seek the flowers most sweet and fragrant,
And, sipping honey, stroll about,
  At best a good-for-nothing vagrant!"

"Nay," said the bee, "you do me wrong;
  I'm useful too; perhaps you doubt it,
Because—though toiling all day long—
  I scorn to make a fuss about it!

"While you, with every egg that cheers
  Your daily task, must stop and hammer
The news in other people's ears
  Till they are deafened with the clamor!

"Come now with me and see my hive,
  And note how folks may work in quiet;
To useful arts much more alive
  Than you with all your cackling riot!"

[From the German, by John G. Saxe.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

BEFORE the discovery of America by COLUMBUS in 1492, all the undiscovered world—from Cape Bojador, on the western coast of Africa, easterly to the Indies—had, by successive Popes, been conceded to Portugal; but in 1493 Pope ALEXANDER the VI., fearing the discovery of COLUMBUS under the patronage and in the interest of Spain, would lead to a conflict of authority and desiring to prevent all difficulty between the nations, decreed that all the world west of a line drawn from the North Pole, passing through a point 100 leagues west of the Azores, should belong to Spain; while Portugal should hold all east of that line, which was not at that time known and in possession of other powers. Other nations soon became dissatisfied with that allotment, questioning the right of the Pope to act in the matter. Then, as now, it was national as well as individual practice

"For those to *get* who have the power,
And those to *keep* who can."

The doctrine of right by discovery was soon admitted and other nations became eager to join in the search for new possessions, in the hope of obtaining treasures of gold, silver and precious stones, in which all unexplored countries are supposed to abound.

We will not stop to discuss if MADOC, son of OWEN GWYNETH, Prince of North Wales, did in 1170 visit North America; or if in the Tenth Century the Northmen landed on the New England coast, as believed by many, but of which BANCROFT says there is no clear historic evidence to establish the probability. Historians agree that JOHN CABOT or CABOTA, an Italian sailing under British authority, found the North American Continent in or about the latitude of Labrador in 1497. The next year his son SEBASTIAN made an examination of the coast so far south as Chesapeake Bay, thus giving the right of prior discovery to that portion of the Continent to Great Britain.

Portugal, although then ranking first among maratime nations, sent but one expedition to the New World. In 1501 CORTEREAL coasted about 600 miles below latitude 50°. He enticed some Indians on board his ships whom, on his return to Portugal, he sold for slaves.

The French caught fish off Newfoundland in 1504, but VARRAZZANI was the first explorer sent out by that nation. He, in 1524, coasted from North Carolina to Nova Scotia. In 1534 JAMES CARTIER entered the Bay of Chaleurs, New Brunswick. He afterward landed at Gaspe, where he raised a cross and took possession in the name of the French King. The next year he sailed up the River St. Lawrence so far as the Isle of Orleans. Here he left his ships and proceeded up the river with boats to another island on which was a high hill. This he climbed, and finding the view from its summit extended and beautiful, he named it Mont Real—now Montreal—Royal Mountain.

Domestic difficulties—of both religious and political nature—prevented France from engaging in discovery, exploration or colonization for many years, and it was not until 1603 that an attempt to colonize Canada was made. Then SAM'L CHAMPLAIN made his first expedition and selected Quebec as the site for a fortification. On his return to France the same year he found the Sovereignty of Acadia had been conferred on a Calvinist named DE MONTS, whose patent covered all territory in America between latitudes 40° and 46°, which included both Philadelphia and Montreal. An expedition was fitted out and the first permanent French settlement in America was made at Port Royal—now Annapolis—in Nova Scotia, in 1604 two years before the English arrived at James River, Va. DE MONTS examined the New England coast as far southward as Boston. Jesuit priests arrived in 1612 and enlisted the Indians between the Penobscot and Kennebec rivers as allies of France and a settlement was made on Mt. Desert Island.

Meantime CHAMPLAIN had returned to Quebec, ascended the Sorrel River, discovered the lake that bears his name and succeeded in establishing French supremacy in Canada which was retained for more than a century.

While the French were thus establishing themselves in Canada, the Spanish were advancing their explorations in the south. PONCE DE LEON, a companion of COLUMBUS on his second voyage, who had accumulated riches while Governor of Porto Rico in ways not entirely consistent with the rules of honesty, was ever ambitious and energetic. Tales of a fountain, the use of whose waters would bestow perpetual youth, he had heard and believed. Gold and precious stones were said to abound in its vicinity. Here, he thought, was an opportunity to drink of the elixir of life, to amass immense riches and attain an empire in a new country. He sailed from Porto Rico in 1513 and on Easter Sunday (Pascua Florida) saw the land and named it in honor of the day. A landing was made a few miles above St. Augustine. Supposing it to be an island, search was made for a passage westward. He doubled Cape Florida, named the Tortugas (Turtle) Islands and returned to Porto Rico. He again visited Florida in 1521, to take possession of the country, but was killed in a conflict with natives.

Spanish ships in 1519 visited the Gulf of Mexico and examined its coast, mapped the position of the outlets of the Mississippi and reached Vera Cruz, where CORTEZ had been some years before. Two ships from St. Domingo in quest of slaves, touched the shores of South Carolina in 1520.

In 1525 an expedition in search of a northwest passage, under command of STEPHEN GOMEZ, entered the bay of New York and examined the coast of New England. This section on old Spanish maps is designated as Gomez Land.

In 1528 NAVARREZ entered Tampa Bay, and directing his ships to meet him, went overland to St. Marks. Failing to find his ships there he constructed rude boats and in them proceeded westward. After passing one of the mouths of the Mississippi the boats were separated by a storm. One, commanded by CABEZA DE VACA, was thrown ashore near Galveston, and one by CASTILLO a little further east. Of the fate of the others nothing definite is known. CABEZA made friends with the Indians and learned their language; and in 1534, with three others—all that remained alive—escaped from the natives and started inland. They went through Texas north to the Canadian River, then westwardly to the valley of the Rio Grande del Norte; thence still westward until in 1536 they reached the Pacific in the vicinity of San Miguel. Here other Spaniards had settled, having come by way of Mexico, then called New Spain.

Reports had reached the Governor of New Spain of seven cities of Cibola lying northward beyond the desert that were very rich in silver and gold. To find these, exploring parties were sent out, one of which in 1540 ascended the Colorado River to a point 100 miles above the present boundary of the United States, about the same time another party struck the same river still further north, and still another discovered a canon of the Colorado. Others went further east and the country was searched from Kansas to the Pacific but none of the seven cities of Cibola were found. Disappointed in their search for this northern Peru, they all returned to New Spain (Mexico) in 1542.

In 1537 FERDINAND DE SOTO was appointed Governor of Cuba, with power over all the Floridas. This comprised all the territory of the eastern United States of which the Spaniards had knowledge. Selecting 600 applicants for fame and fortune from the many who applied, he sailed for Cuba. On his arrival two Indians gave him glowing descriptions of the wealth of the mainland and DE SOTO, leaving his wife to govern in his stead, sailed for Florida. Confident of success he sent his ships back to Cuba and took up his march inland. He had a regular army of horsemen and infantry fully equipped, accompanied with extensive baggage trains. They left the bay of Spirito Santo in June, 1539, and reached the Flint River, not far from the bay of Apalachicola, in October of the same year. Turning northward they probably visited Upper Georgia and possibly North Carolina, in search of gold, of the abundance of which they were continually told; but their efforts to find it were fruitless. Leaving the head waters of the Savannah—or its branch, the Chattooga—they went westward and after many delays struck the Mississippi River in April, 1541, at about latitude 35°. They crossed the river and ascended the western shores to near New Madrid, from whence a party was sent to explore further north. They reported having found a barren country. DE SOTO then went west and northwest to the highlands of the White River in Arkansas, 200 miles west of the Missouri. Thence they went south to the Tunicas, near the hot springs and saline tributaries of the Washita. The next spring (1542) they followed the Washita to its junction with the Red River and thence to the Mississippi. Here DE SOTO died. His body was wrapped in his mantle and at midnight buried in the middle of the river. His followers fearing to embark on the river, thought to reach Mexico by land and traveling thenceward, in July found themselves in the neighborhood of Natchitoches. The Red River was so swollen as to render it impassable. They followed down its stream, again reaching the Mississippi, where they built boats in which they descended the river, reaching the gulf in July, 1543.

In 1547 LOUIS CANCELLO, a Dominican, received permission to undertake the Christianization of the natives of Florida. The attempt was unsuccessful and civilization was, for a time, abandoned. Spain nevertheless, by virtue of the various expeditions beforementioned, claimed title to all of North America so far as Canada and Newfoundland. The Chesapeake Bay was named on Spanish maps in 1549 as the Bay of St. Mary; but there is no record of its discoverer nor of any Spanish exploration of the vicinity.

So late as 1560 no permanent settlement had been made on the Atlantic Coast of North America. In 1562 COLIGNY, desirous of establishing a refuge for the Huguenots (or Protestants) of France, obtained from CHARLES IX. permission to send out a company that landed near Port Royal, S. C. There they built a fort and gave to it and the surrounding country the name of their sovereign CHARLES—or CAROLUS—whence Carolina. The enterprise was a failure and the fort was soon abandoned.

In 1564 COLIGNY sent another colony, who selected the St. Johns River for their place of debarkation. Here also they built a fort named, as the other, Fort Charles. But dissensions soon arose. The colonists were wanting in moral principle; mutinies were frequent. Some of the most turbulent demanded and received permission to return to France. But no sooner were they at sea than they commenced acts of piracy against the Spaniards. The remainder of the colonists were about to abandon the enterprise when RIBAULT arrived from France with more emigrants and full supplies. Success then seemed certain.

But the Spaniards were jealous. They claimed the country not only by right of discovery, but also by concession of the Pope, and would not think of relinquishing it with its supposed immense wealth to the French, and especially to French Protestants. So MELANDEZ was sent in 1565 with a large force to break up the colony. On the day consecrated in the Romish calendar to St. AUGUSTINE, he sighted the coast and entering a harbor he gave it the name of that saint. Sailing thence northward he soon found the French ships at anchor, which, not being prepared for battle, escaped by cutting their cables and putting out to sea. The Spaniards returned to St. Augustine where they landed, proclaimed PHILIP II. King of all North America, and laid the foundation for the town of St. Augustine Sept. 8, 1565, 40 years before an English colony was established at Jamestown. Houses are still standing in St. Augustine that were built long before the first settlement in Virginia.

The French now determined to make an attack on the Spanish, hoping to surprise them before they had made ready for defense; but a fearful storm arose which dispersed the fleet and wrecked every ship, from which most of the crews were so fortunate as to escape. Learning this, the Spanish made an immediate attack on the French fortifications which were easily taken. Most of the colonists as well as the captured sailors were murdered, "Not as Frenchmen, but as heretics."

The French Government, occupied with its difficulties at home, paid no attention to this outrage on its subjects; but retribution soon followed. Two years after, in 1567, DOMINIC DE GOURGES at his own expense fitted out three ships, with which and 150 men he surprised the Spanish at the mouth of the St. Johns River and gained possession of the place formerly occupied by the French colony. Being too weak to maintain their position he returned to France after hanging all the prisoners and placing over them an inscription, "I do not this as unto Spaniards, but as unto traitors and murderers." France disclaimed any connection with this transaction and relinquished all claim to Florida.

The first English colonial charters in 1606 gave to two companies all the land from Cape Fear to Halifax, except a small territory in Acadia (Nova Scotia) then in possession of the French. By this time, not only had the concessions of the Popes become null in public opinion, but the right by discovery was exceedingly weak. Actual possession was nine points in the game, and no nation then, any more than at present, had scruples about claiming and taking all they could hold. To one of these, known as the London Company, was given the exclusive right to the country between latitudes 34-38°, from Cape Fear to the mouth of the Potomac. To the other, known as the Plymouth Company, territory between latitudes 41-45°—from the southern extremity of Connecticut to the northern line of New York. The country between these grants from 38° to 41°—being left for settlement by both Companies, provided they came no nearer to each other than 50 miles.

In all the early charters the western limits, if any were fixed, were the Pacific Ocean—sometimes called the great South Sea—which was then supposed to be but a short distance from the Atlantic. Under the charter of the London Company Virginia was settled and was governed well and liberally until 1624, when the Company was arbitrarily dissolved by King JAMES, through actions of judges who were his creatures and ready to do his will. Virginia then became a royal colony.

In 1632 CHARLES I., then King, granted to Lord BALTIMORE a charter for the country bounded by the Atlantic Ocean, the 40° parallel, the Potomac River from its mouth to its source and a line drawn due east from Watkin's Point to the Atlantic. This territory was made a royal province and named in honor of HENRIETTA MARIA, wife of King CHARLES I. Thus were the limits of Virginia circumscribed on the north.—To be continued.

IF we look upon life as a gift of days, one at a time, all its duties can be done, all its burdens borne.

The Story-Teller.

ONCE A COWARD.

CHAPTER I.

IT was one evening after we had come in from shooting that she said it. I remember that. I remember, also, how cheerily the library window at the old hall gleamed out to welcome us, making a ruddy stain on the wet gravel. Didn't it look cosy, too, after a long, tiring day spent in tramping through heavy turnip fields and stiff wet stubble! And yet there was a cosier thing than that before us soon.

My cousin Helen's face! It beamed out on us, a lovely picture framed in the dark, heavily-carved doorway, a bright, glowing face set against a bright, glowing background like the portraits of some mediæval saint; a glorious face always, but when, as now, bringing the full light of its moist blue eyes and flushed sweet smiles to bear on its fellow-creatures, utterly irresistible.

One of our party—Ducie of Enderbeau—did not attempt to resist it. So completely, indeed, had that gentleman fallen under my cousin's yoke that I daily expected to hear that, out of sheer gratitude for his worship, the young lady had promised to return him that "love, honor and obedience" which we find mentioned in the common prayer-book; nor would the tidings have displeased me. I don't know how it would have been if I had wished to marry Helen myself; but when a fellow has got a dear little girl of his own waiting for him he can afford to be magnanimous about his cousins. He turned into the library at once, saying something to Helen as he passed her which made the flush deepen pinkly in her fair cheeks, and Tom Jackson and I followed.

I fancy it was Devereaux's absence which turned the conversation on him. Jackson never could bear him and said so, adding, like the broad, outspoken Yorkshireman he was, that the fellow had no more courage than a rabbit; "actually winced every time a gun went off near him." One of the girls rather objected to this; but Mary Jackson took her brother's part and gave us an amusing instance of Devereaux's want of courage in some mountain adventure they had enjoyed together. She made us all laugh by the way she told it, and it was then Helen exclaimed, with a scornful curl of her pretty lips.

"I am sorry you told us. I never liked Captain Dovereaux, but I detest a coward."

Girls, when of impetuous dispositions, sometimes use stronger expressions than they have any idea of. The bitter word *coward*, flung like a shot into the middle of our little group by a girl, produced a momentary silence; and I began to feel annoyed with our fair cousin for forgetting that Devereaux was our guest and to meditate giving her a private lecture.

To my unutterable surprise Ducie saved me the trouble by taking the reins into his own hands and bringing up the spirited offender with a jerk. He had been leaning against the mantelpiece, gazing down at her with a sort of dreamy admiration in his dark eyes; but now he straightened himself as suddenly as if the shot had struck him and spoke in a dry, hard tone, which must have been quite new to his beautiful young hostess.

"Do you think that is a fair term to apply to the gentleman in question, Miss Curtis?"

Helen stared. She was not used to rebukes from her lover and instantly resented this one by as dry and hard an answer.

"After what Miss Jackson has just told us? Yes, Mr. Ducie, I do."

"Then I think you are very wrong, if you will allow me to say so."

"You do not want to be allowed——" Helen began haughtily; then flushed up and softened, like a regular woman, into a personal appeal. "But I could hardly make allowance even for you, Mr. Ducie, whom we know to be a brave man, if you did not hate cowardice at least as much as I do."

"I do—*hate* cowardice," he answered, with an unwonted emphasis which struck us all. "So much so, that I do not even like to hear the word applied to a man who probably does not deserve it."

"But if he does?"

"You have no proof that Captain Devereaux does."

"Not Mary's story? Oh, Mr. Ducie," (getting angry again and her blue eyes flashing impatiently,) "you cannot bring me to look at bad things with simple indifference. The word may be ugly, the thing is much uglier; and not even your eloquence (very scornfully) could make me regard a coward with any feelings but pity and contempt."

Mary Jackson, whose tongue had provoked the quarrel, rose uncomfortably, saying it must be time to dress, and fluttered away, Tom Jackson and his pretty wife following. Then, to my great joy, Helen, seeing herself left alone, rose to depart likewise, and was turning to the door when Ducie stopped her.

"One word," he said, speaking with a sort of forced calmness. "Putting this nonsensical story of Miss Jackson's on one side, would you call a man a coward because his courage has failed him signally in one solitary instance?"

I bit my lip. I saw Helen was on her mettle; and, indeed, her answer proved me right.

"Decidedly I should. I judge a man's heart by what he does, not by what he says; and the more sudden the call the more surely he acts according to his natural instincts. One greater than you or I said of His disciples, 'By their fruits ye shall know them;' and I—when I see a man do a cowardly act, I know he must be a coward at heart.

You are making yourself special pleader in a very bad cause, Mr. Ducie. Pray let us drop the subject. You forget" (drawing up her head like an offended queen) "that my father died before Lucknow and therefore it is not likely that his daughter should have any sympathy for a coward."

"I am sorry for it," he said, gravely. "I should have thought the fact carried its own punishment heavily enough without. Miss Curtis, it wants ten minutes yet to the dressing-bell. May I tax your patience for half that time while I tell you a story?"

"Certainly," she said, and sat down again with a little air of offended surprise.

"Two years ago," Ducie said, "a friend of mine and his servant were traveling in South America. The former went abroad for his health—not that he was ill when the anecdote I am going to tell you took place. You will please not make that excuse for him—he was perfectly well and he took his servant with him because the lad was so attached to him, such a faithful, true-hearted fellow, that he could not make up his mind to leave him behind. It was scorching hot weather; such heat as you may expect in a country which lies on the southern border of Brazil; and my friend used to go every morning to bathe at the Plaza Ramirez, a large, unsheltered bay about a mile and a half from the town. A beautiful stretch of sand it was; the best bathing place in the neighborhood, and yet a very dangerous one, for if you went outside a certain number of yards you were liable to get entangled in one of two or three conflicting currents which, in a dead calm, you could see curling about within each other like harmless sea serpents but which, if they caught you in their strong embrace, would assuredly carry you out into the Atlantic unless you happened to be a strong and clever swimmer.

"Well, one morning my friend and John Barton, his servant, went to bathe as usual about seven o'clock—a late hour in those climates, Miss Curtis, where most people start at five and where the sun is almost strong enough to roast the brains in your head by eight. As a natural consequence, they found themselves alone at the plaza, having met most of the Montevideans returning.

"My friend went in first, leaving Barton to watch his clothes, lest any of the small fry from the negro hamlet of washerwomen above the bay should come down and appropriate the articles; and when he had sufficiently refreshed himself and emerged on to the sands again, Barton went in for a similar enjoyment. It could not possibly have been five minutes later. He had barely got into his clothes when he heard a piercing shriek from the water and turning, saw that Barton had disappeared. The next moment, however, the lad's head rose to the surface about a dozen yards from the shore and he cried out, 'Master, help! The cramp! Help!' before going down again like a stone.

"Of course you think the master dashed in and dragged him out. It was not much to do for this faithful fellow who served him so well and left his home and friends rather than leave him. He did no such thing. He hesitated and his limbs turned to ice and every drop of blood in his body to water. Like a wave there rushed over him the thought that he could not swim a stroke—that he was encumbered with his clothes—that Barton was a stronger man than himself—that once in the current, with a drowning man's clutch at his neck, they must both inevitably be swept out to sea and perish. It was only a moment; then the lad's head rose again. For one second his eyes caught his master's face in a look of wild, despairing appeal, and maddened by the situation my friend rushed—not into the water, but up the bank, shrieking for help to the men who drive the sand carts along the brow of the bay. Before he had gone two yards—before they even heard him—Barton sank for the third time and—all was over.

"Sheer physical fear, a spasm of unconquerable cowardice which he had never felt before in his whole life and which, finding him utterly unprepared for it, completely overmastered the man's entire nature, had in that one miserable minute cost the life of his faithful servant and darkened his own forever.

"There's not much more to tell you. It was just the turn of the tide. Within twenty minutes of the affair the waves flung poor Barton's dead body within reach of the man who might have tried to save his life and did not. The 'peons' helped him to carry it up the bank and lay it on the sand cart to bring it into town. I believe it was buried decently next day. They told me so; but before then I was ill, raving with a sun-stroke which——"

"You!" The word leaped from my lips in a cry of horror. "Ducie! You don't mean that you have told us of—that you were that——"

He turned and looked me in the face.

"Yes, Fred, I was that man; I, whose 'pluck' people are so fond of praising."

There was a dead silence.

CHAPTER II.

"That is all. I never told any one before. I don't think I could act in the same way again; but God knows. Only you see I cannot bear other men condemned when I remember——" He broke off with a sort of gasp and added, hurriedly, "I wish to heaven I had never needed to tell you, for of course I know what you think of me now."

He looked at Helen; but she never raised her eyes, and I answered quickly:—"I wish you had not, Ducie. There was no occasion for it. But I am very sorry for you—from my soul I am, old fellow."

I would have given him my hand; but though he said, "Thank you, Fred," as if he meant it, his eyes never left Helen's face. She had never moved or looked up once, since he began. I feel sure now, that she knew, from the commencement, that he was speaking of himself; but it was only when he said "I was the man," that her face, which had been white to the lips, flushed scarlet, as though the threatened blow had fallen; and such a look came over it—a look of pain unutterable, of bitter shame, of unconquerable disgust—a look which, but to see once in the face of the woman we love, might well make the voice break and the heart sink, as Ducie's did then.

We all met at dinner as if nothing was amiss. Mary Jackson and I were, I think, rather more lively than usual; and even Tom made himself so pleasant to Cis Devereaux that my dear old father said it did him good to hear such a clatter of voices. Ducie was very silent, it is true, and Helen's face was colorless as a Guernsey daisy; but she spoke and even smiled whenever appealed to and none but myself remarked that when Ducie held the door open for the ladies after dinner, she drew the silken folds of her dress together and passed him without a glance, as something too foul for notice. His face was whiter than hers when he sat down again.

Next day we parted. I was busy all the morning over farming accounts and did not know Ducie was going till the dog-cart was at the door and he came in to bid me good-by. Then I saw he was much agitated and urged him to stay, using Helen's name.

His lips quivered, but he only said:—"I have already seen your cousin. Good-by, Fred, and thank you for all your kindness."

Five minutes later he was gone. I said nothing but I went to look for Helen, and found her moping in the library, with a face like a ghost and red rims to her eyes. She mumbled something about a headache. I waived the remark loftily and taxed her with having refused my friend. She reddened like a rose and said, haughtily, that she had done no such thing. He had not had the presumption to ask her.

"Presumption!" quoth I; "and to ask a little vixen! Ah, well, you have sent him away; and, what's more, will never see him again!"

At this she paled and panted a little. Then flushed up again and answered:

"Oh yes, we shall, and quite as soon as we want him, I dare say. Oh! how can you care for him, the cruel, dastardly— Oh!"

This made me angry, for I don't like hitting a man when he's down; and the vision of poor Ducie's handsome face, with the haggard, beaten look on it, as he shook his head to all my hospitable hopes of soon seeing him again, rather haunted me. So I set myself to bully Helen by way of retaliation; told her she was a proud, self-righteous girl, who didn't deserve to be loved at all; that she had, probably, sent a fine young fellow to the bad; that she had no right to judge anybody; that if Ducie had acted a coward's part two years ago he had taken a hero's last night; that I doubted very much whether she would have the courage to stand up and blacken herself forever in the eyes of any one she loved; that I couldn't, and that it was a braver and nobler deed than saving ten men's lives.

Would you believe it? In the middle of my abuse she suddenly burst into tears and, instead of quarreling with me, throws herself into my arms and sobs out:

"Oh, Fred! so it was. Oh! I never thought of that; and I told him—I told him—— Oh, dear! oh, dear!"

"What did you tell him?"

"I told him I never wished to see him again, because he could never do anything brave enough to blot out the memory of that dreadful, dreadful day."

"And what did he say?"

"He said, 'You never shall.' Oh, Fred, Fred, what shall I do?"

"Do? Write and tell him you are very sorry and ask him to come back again;" a piece of sensible advice at which Helen springs up, dashes away her tears and says, indignantly:—"Thank you, Fred, I have not quite lost my self respect yet, even if your friend has lost his," and marches off to her own room.

Was it the day before Christmas Eve that the Governor told me Lord de Laine had proposed to Helen and been refused? I think so—I'm not sure. Anyway, it was that day that I first noticed the girl's white face and spoke to her of Ducie. Her sweet eyes flashed up instantly and she answered:

"Would you like to have him here this Christmas?"

"My dear, you told him never to come again."

"Then I was wrong, for it is not my house" (hypocritically).

"You are mistress of it and I'll have no friends here whom the mistress cannot welcome."

She blushed up high, put her hand on my arm and said enthusiastically:

"All your friends are welcome to me, Fred. Please write and ask him at once."

I did so. Shall I ever forget her face when the answer came? Mr. Ducie had sailed for the Cape three days before in the royal mail steamship Tamar.

We all know the end of that good vessel; how she encountered hard weather off the Azores; how she sprung a leak, which no pumping day and night could bring under; how the boats were hoisted out with just enough seamen to work the oars; the passengers lowered into them one by one, women and children first, men afterward, in perfect discipline and order; and how, when all were full, the captain, standing on the poop-deck, gave the last command to pull away out of the vortex of the sinking ship; and the men in the boats, obeying, saw the gallant vessel, with captain, crew and officers standing hand in hand, brave and resolute to the last, settle heavily down in the deep trough of the waves and disappear forever from mortal ken.

Ah, me! all English hearts were thrilling with the story in those days. It makes mine ache now to recall it.

The boats reached the Azores in safety two days later, without having lost a soul but it was not for months, not till every inquiry had been made, not till I had gone down to Southampton myself and interrogated the rescued passengers one by one that we heard how, when the boats were all but full and there was only one passenger to descend, one of the crew cried out in despair, "Oh, my little wife and child!" and the passenger, a tall, dark-eyed young man, turned to him and said, "Take my place; there is no one belonging to me at home," and had stood by the captain's side at the last moment and waved his hat to his friends in the boats in a cheery good-by.

I found out that sailor and he gave me a scrap of paper which he said the gentleman had torn from his pocket-book and given him as he went over the side. It was to Helen and contained these words:

"God bless you! I have earned my right to meet you again—in heaven at least.

"A. P. DUCIE."

Two years later Helen left us to keep that meeting; and when she was dead I saw the first smile on her pale lips which had ever shown there since she sent her lover away to prove that a man may die a hero's death, though in life he has once been a coward.

DIFFERENT KINDS OF ENGRAVING.

"LINE" engraving is of the highest order. All great engravings are done in "line"—simply straight lines. Next comes "line and stipple." "Stipple" means dots—small dots, like this ..... These small dots are used to lighten up the high parts of the face or drapery. It is very hard to engrave a face in lines simply, and only master engravers have ever undertaken it. The masters understand and practice both "line and stipple."

Claude Mellan engraved, in 1700, a full head of Christ with one unbroken line. This line commenced at the apex of the nose and wound out-and-out, like a watch-spring, until it ended in the border of the picture. Mezzotint engravings are produced thus:—The steel or copper is made rough, like fine sand-paper. To produce soft effects, this rough surface is scraped off. If you want a white place or "high light," in your engraving, scrape the surface smooth and then the ink will not touch it. If you want faint color, scrape off a little. Such engravings look like lithographs.

Etching is adapted to homely and familiar sketches. Almost all the great painters were etchers. Etching is done thus.—The copper or steel plate is heated and covered with black varnish. The engraver scratches off this varnish with sharp needles, working on the surface as he would on paper with a pencil. Nitric acid is then poured over the plate and it eats away at the steel and copper wherever the needle has scraped off the varnish. Whenever the varnish is removed with spirits of turpentine the engraving is seen in sunken lines on the plate.

DANGER OF STIMULANTS.

THAT man is nothing less than a deliberate suicide who drinks tea, coffee or ardent spirits of any kind, to induce him to perform a work in hand when he feels too weak to go through with it without such aid. This is the reason that the majority of great orators and public favorites die drunkards. The pulpit, the bench, the bar, the forum, have contributed their legions to drunken habits. The beautiful woman, the sweet singer, the conversationalist, the periodical writer, has filled but too often a drunkard's grave. The best possible thing for a man to do when he feels too tired to perform a task or too weak to carry it through, is to go to bed and sleep a week if he can; this is the only true recuperation of brain power; the only actual renewal of brain forces, because during sleep the brain is, in a sense, at rest—in a condition to receive and appropriate particles of nutriment from the blood which take the place of those which have been consumed in previous labor. Mere stimulants supply nothing; they only goad the brain, force it to a greater consumption of its substance, until that substance has been so fully exhausted that there is not enough left to receive a supply; just as men are sometimes so near death by thirst and starvation, that there is not strength enough left to swallow anything, and all is over. The capacity of the brain for receiving recuperative particles sometimes comes on with the rapidity of lightning and the man becomes mad in an instant; in an instant falls into convulsions; in an instant loses all sense and he is an idiot. We repeat, that there is renewed force for the brain only in early and abundant sleep.

Sabbath Reading.

YOU AND I.

SWIFTLY o'er life's troubled current
We will fly,
Bearing all its toils and dangers,
You and I.

Storms may gather, tempests lower
O'er our sky;
Steady, firm, we'll guide our life-barque,
You and I.

Heaven's broad bay we'll safely enter,
By-and-by;
In its port we'll cast our anchor,
You and I.

And within that Golden City,
Built on high,
Hand in hand we'll walk together,
You and I.

SOMETHING ABOUT THE GENUINENESS OF THE BIBLE.

WE find the Bible as the inspired writers left it—as much so as any ancient writings that have come down to us from the distant past. The present Bible is the same as the Bible of the primitive church. This is an interesting subject and ought to gain the attention of all. In the words of a great author, "The integrity of the records of the Christian faith is substantiated by evidence in a tenfold proportion more various, copious and conclusive than that which can be adduced in support of any other ancient writings."

There are more printed copies, and a greater number of manuscripts that have come down the stream of time, and there are more versions of the Scriptures than any book in the world.

It was a noble omen for the future progress of printing that the first book ever issued from the press was the Bible. The Vulgate Latin Bible was published in 1455, and (if I mistake not) it stands unsurpassed by the latest efforts of typography. The wonderful, useful and honorable art of printing effectually prevents the corruption of the text. And the MSS. of all ancient writings, sacred and profane, are now in the safe custody of the press. Since the invention of printing about one hundred different editions of the Hebrew Bible and three hundred and fifty of the Greek Testament have been published, and millions of copies in all languages multiplied.

When the Bible was first printed there were manuscript copies in most of the public libraries of Europe. Nearly 2,000 of these MSS. have been collated in forming the text of the Bible. In the case of the Greek and Latin classics ten or twenty MSS. are deemed sufficient to form an accurate text. The most ancient MS. of "The Father of History," as Herodotus is called, dates back only to the tenth century, and only fifteen MSS. of this ancient author have been collated, and yet the genuineness of the writings of Herodotus is established. Some MSS. of the Hebrew Bible date back to the eighth century. The Alexandrian MS. of the Old and New Testaments dates back to the eighth century, and the Vatican MS. to the fourth century; also the Sianiticus to the fourth century. The Codex Regius belongs to the fifth century. One MS. of Virgil dates back to the fourth century. But the MSS. of the ancient classics date from the fifteenth to the tenth century, so that in antiquity as well as numbers they are greatly inferior to the MSS. of the Bible.

When we reach the time of the earliest MSS. we come up with the quotations from the Bible by different writers, some friendly to and some opposed to it. The quotations are made in the very words of the Scripture. And in one hundred and eighty writers (whose works are still extant) we have quotations from the New Testament so numerous that Dr. Bently has collected nearly all the New Testament from authors who flourished before the seventh century. The Old Testament text in like manner can be gathered out of the Targums (ten in number), running back to the first century. These Targums are translations of ancient Hebrew into Chaldee-Hebrew, the original Hebrew having ceased to be the spoken language of the Jews after the Captivity of Babylon.

The ancient versions also establish the genuineness of the Bible. A version of the Bible was made into Slavonic or old Russian in the ninth century. In the fourth century into Gothic, Ethiopic and Egyptian. Also the Vulgate by Jerome between 382 and 405. The Perlicto Syriac version was made early in the second century. Still more ancient are the versions of the Old Testament made by Aquila, Symmachus and Theodotian, and the version of the Seventy or Septuagint made in Egypt under the Ptolomies, begun 282 and ended 150 B. C.

THOUGHTS FOR THINKERS.

A FIRM religious belief creates new hopes when all earthly ones have vanished.

WHAT God effects through the powers with which he has endowed man is no less his work than the heavens and earth are.

A HOUSE uninhabited soon comes to ruin, and a soul uninhabited by the Holy Spirit of God verges faster and faster to destruction.

IF thy conscience blame, though ever so little, despise it not, nor neglect the secret check; 'tis a messenger from heaven sent to summon thee to thy duty.

PRIDE is an extravagant opinion of our own worthiness; vanity is an inordinate desire that others should share that opinion.

Ladies' Portfolio.

SCANDAL.

When the cannibal savages after a fight
Make a feast on the bodies of those they have beaten,
The grisly repast yields a keener delight
From the knowledge that every unfortunate wight
Would have deemed it the deepest disgrace to be eaten.

Though the custom is fast dying out in Fiji,
As the influence of Western example increases,
In civilized countries you often may see
A circle of friends in the highest of glee,
All lustily picking a neighbor to pieces.

And the best of it is that the neighbor is not,
As in islands barbaric, a person deceased;
His flesh has been baked in no caldron or pot;
They don't even trouble to serve them up hot;
For the victim still lives in the midst of the feast.

Some good-natured friend, p'r'aps, may make him aware
Of the nature of these hungry monsters' employment;
And though in reply he may stoutly declare
That such vivisection won't hurt him a hair,
Yet he writhes at the thought of their fiendish enjoyment.

Still one comfort remains. In the isles of Fiji
No possible vengeance is left for the victim;
He is cooked and defunct. But in Europe he's free
To seek satisfaction; and sometimes we see
That he wounds in exchange for the wounds which have pricked him.

Then beware, Mrs. Smith; beware, lovely Miss Brown;
Young Jones, whisper nothing that isn't quite true;
Be a little more careful of others' renown,
For Thompson in yonder recess has set down
With Miss Green, and is quietly cutting up you.

[*Belgravia.*

HOW TO PRESERVE THE TEETH.

BY A FAMILY DOCTOR.

Personally I have always had the greatest aversion to medicine—that is, to taking it. Oh! prescribing it to others is quite another thing.

A tooth is composed of three different structures, or tissues—viz., the main portion, which is called the ivory or tooth-bone; the enamel, which forms a crust, as it were, over the whole exposed portion of the tooth. This enamel it is which gives to the teeth their chief beauty, or pearly appearance; it is most beautifully seen in the teeth of young dogs. The third structure is the cementum; this covers the roots, fangs or unexposed portions of the teeth. Every tooth is hollow in the center, being filled with what is called the pulp—a collection of cells, blood-vessels and nerves, which are conducted to this hollow or central portion by a minute canal, which runs up through the roots of the teeth. This is all you need bear in mind, for our present purpose, about the structure of the teeth.

It may seem very hard, but it is none the less true, that we are only allowed two sets of teeth to last us a whole lifetime, and if we need any more we are to apply to the dentist for them. It is the object of this paper to show you how you can preserve your own natural teeth, and thus be independent of any dentist.

I have heard of babies being born with a fully-developed set of teeth; I have heard a great many things which I do not believe. Before telling you the time at which you are to expect the appearance of the milk teeth or the permanent teeth, let me try to explain to you the names they generally go by in medical phrascology. The incisors are what are commonly called the front, or cutting, teeth; behind them are the canine teeth—the pointed ones—we all know those; behind the canines are the first and second bicuspids, or anterior grinders—very handy teeth indeed; pity it is they should usually be the very first to decay. Behind these again come the first and second molars—back teeth, or big grinders; and last of all, and furthest back, come the third molars—the *dentes sapientæ*, or wisdom teeth, so called because they seldom appear before we are twenty-one, and either married quite, or thinking about getting married. The lower posterior molars have only two roots or fangs, and quite enough, too, you will be inclined to think when you are having one pulled; but the molars in the upper jaw have three fangs, and sometimes four—it is terrible to think of!—and you need twice as much nerve and courage to have one of them taken out. Now, an adult has, altogether, thirty-two teeth, and a child or young person has only twenty.

"Cleanliness is next to godliness," runs the proverb, and I've heard a man make this remark, who positively was rubbing his face with a wet towel, because he was too lazy to wash it. Will nothing ever convince men and women that, in order thoroughly to enjoy the *mens sana in corpore sano*, they *must* go in for thorough and complete ablution by bathing every morning of their lives? But if people are for the most part neglectful of their skin, tenfold more so are they of their teeth.

If you, young lady, are only careful of your teeth now, and cultivate habits of cleanliness as regards them in the way I shall point out, I can promise that you will have them still good, and nearly intact, when you are an old woman of ninety going on two sticks.

Not only is digestion interfered with, from improper mastication of the food, but cases of dyspepsia may often be traced to this cause, combined with carious or decaying teeth, which actually poison the food that was intended for the nutriment of the body.

The tooth-brush is as much an indispensable article of the healthy toilet as is the hair-brush itself. Tooth-brushes should not be too hard, as they injure and sometimes indurate the gums; neither should they be too soft, else they are useless. *In medio tutissimus ibis.*

There is one thing which a great many people seem to forget, and that is that the inside and the crowns of the teeth, too, want cleaning as much as the outsides, although the outsides only are seen. You ought, therefore, to provide yourself with both outside and inside tooth-brushes, which can be easily procured at any respectable druggist's. Never buy a cheap article; it is dear in the end. Avoid India-rubber tooth-brushes; and remember always to rinse the brushes in cold water after using. Perhaps it may be an additional inducement to the reader to be careful in cleaning the teeth, to inform him that parasites of a very ugly form indeed take up their abode in the human mouth where cleanliness has been neglected.

Brush the teeth at least twice a day, and after every meal it is a capital plan to rinse the mouth with pure cold water—no, not rose-water.

A tooth-brush crescentic in the formation of its surface is a handy one, so also are those right and left-handed ones with beveled edges, as they do not injure the gums.

What tooth-powder is best? Well, the simpler it is the better, and some people very wisely use nothing at all but pure bicarbonate of soda. This is excellent, although the taste is objectionable. Avoid tooth-pastes as a rule, and all powders the composition of which you are not acquainted with; they often put a beautiful pearly surface on the teeth at the expense of the enamel. Here is a simple powder and a good one:—Prepared chalk, half an ounce; orris root and magnesia, of each one-quarter of an ounce—mix. If the teeth be much discolored, get your druggist to add a little powdered cuttle-fish. Camphorated chalk is also very simple, and as good as simple. Rinsing the mouth occasionally with a wash of half an ounce of tincture of myrrh to six ounces of pure water, is a good preservative for the gums.

Neglected teeth, especially in some delicate states of health, are said to secrete "tartar." This is no secretion, but a deposit of the salts of the saliva. If there is much of it, the teeth must be scaled by a proper dentist; if not, brushing the teeth with a soft brush, dipped in weak acetic acid, will have the desired effect.

Some people are afflicted—for it is an affliction, and a very great affliction too—with a foul breath. This may arise either from the lungs, a disordered stomach, or from ulcerated throat or gums, or from decayed teeth. Be the cause what it may, no time should be lost in applying to a properly qualified medical man, to have that cause removed, or something much worse may follow. A solution of chlorinated soda, used as a gargle or wash, will sweeten the breath temporarily; but, depend upon it, this is merely trifling with what may turn out to be the symptoms of some severe disorder.

Be very careful in your choice of a dentist. There is no trade more overrun with quackery—dangerous quackery—than that of dentist.

Never attempt to crack nuts with your teeth. You may crack the teeth instead, and some day, when you have forgotten all about the nuts, you will probably be surprised to find the half of one of your best teeth drop off.

Avoid toothpicks as much as you can. Use a quill if anything. Never under any consideration use a pin. Do you know what may happen if you do? Why, *odontalgia, caries, gomphiasis, odontophlegmone* and *odont*— Oh, don't? well, I won't; but you mustn't use pins for toothpicks; you wouldn't like to have *rhizodontrypy* performed on you, would you?

Give you a cure for toothache? Well, I'm sure I wish I could. You see toothache is of various kinds, and arises from various causes. If the teeth are decayed, they had better be cleaned and stopped, and they will last you for life. If the toothache proceeds from inflammation, rinse the mouth frequently with a strong solution of bicarbonate of soda in hot water; take a strong aperient in the shape of Epsom salts; stop the tooth with cotton-wool steeped in chloroform, creosote, oil of cloves, cajeput oil or tannic acid in ether. If you think it proceeds from neuralgia, take an aperient and several large (3 or 4 grain) doses of quinine, and continue the quinine three times a day, in one-grain doses, for a fortnight after the toothache has gone. It ought to be comforting to know that if attention is paid to the state of the stomach and general health, if plenty of exercise is indulged in, if we are temperate in eating and drinking, and *take our morning bath* pleasantly, neither toothache, foul breath nor spongy gums will ever be our unhappy lot; and, as an Irishman would say, the only tooth-powder we'll want will be clear cold water.

One word in conclusion to so-called "martyrs with toothache." Get the tooth out. Don't hesitate a moment. Go to the most respectable dentist within a radius of ten miles and ask him to extract the offending molar.

FOR AND ABOUT WOMEN.

Anna Dickinson can do everything well in her play except the part where she throws her arm around the man and shouts, "I love you—*I* love you!" In this she shows a lack of experience.

All honor to woman: the sweetheart, the wife,
The delight of our firesides by night and by day;
Who never does anything wrong in her life,
Except when permitted to have her own way.

At a little gathering the other evening a young man asked a lady whether, if his small brother was a lad, he was not a ladder, and she kindly said she thought he must be, she could see through him so easily! It is pleasant to be a young man.

Reading for the Young.

SNOW-FLAKES.

Whenever a snow-flake leaves the sky
It turns and turns to say "Good-by!
Good-by, dear cloud, so cool and gray!"
Then lightly travels on its way.

And when a snow-flake finds a tree,
"Good-day!" it says, "Good-day to thee!
Thou art so bare and lonely, dear,
I'll rest and call my comrades here."

But when a snow-flake, brave and meek,
Lights on a rosy maiden's cheek,
It starts—How warm and soft the day!
'Tis summer!" and it melts away.

[*M. M. D., in St. Nicholas.*

THE WASP AND THE SPIDER.

A wasp entangled itself in the web of a spider and the spider attacked it. The fight lasted fifteen minutes when the wasp was conquered. "Ought we to have released the wasp?" This is the question (or as much of it as need be given) asked in the Rural of June 17. We promised to send a little present to the boy or girl under twelve years of age that should make the brightest answer.

Well, dear little boys and girls, it quite puzzles us, among many answers, to determine which *is* the brightest and although seemingly a little matter, we think it one that should be most carefully and fairly decided.

Some of the answers are very funny. For instance, A. Rouse replies:—"No. You ought to have killed them both."

Allie says:—"Yes. Why? Because it is wrong to let one insect hurt another."

Davie E. Pine replies:—I think you ought not to have taken the wasp away, for if you had done so, it might have stung *you*.

Mattie E. Saunders thinks "the wasp ought not to have been released because he went there of his own free will and accord; therefore let him get out the best way he could or take the consequences."

Anna McMillen is both funny and highly poetical. She says:

"I think you were right
Not to meddle with the fight;
For if you had entered the ring,
You'd got for your trouble a sting!"

Mamie McMillen's answer is thoughtful and excellent. Indeed, had a second prize been offered, we should have awarded it to her:—"You should have released the wasp, for 'blessed are the merciful—for they shall obtain mercy.'"

Nellie Wood of Fair Haven, Vt., replies as follows:—"Yes. 'Do unto others as you would that they should do to you.'"

We decide, upon our conscience, that we deem this answer the "brightest." And so little Nellie Wood, with many hopes that this may be the least of the many prizes that you may draw in the future, we send you by mail a plant of the new Pelargonium "Happy Thought."

A SUGGESTION WORTHY OF ATTENTION.

Dear Rural Girls and Boys:—Now I suppose you will wonder who I am and what I have to say. You may possibly think that I might just as well be silent, but I think you will be patient with me and read what I want to say to you; and if any of you act upon my suggestion, I shall feel amply repaid for my effort in your behalf.

Some of your letters are very interesting, and I always read them eagerly; but I will confess that I often put down the paper with feelings of disappointment, and for this reason: I am passionately fond of flowers, and have long been looking for a letter telling us something about them. I doubt not that many of you love flowers as well as I do, and know more about their cultivation, habits, etc. Don't you think you could write much about them that would be read with delight by some of your friends?

Doubtless many of you cultivate flowers—some of you, perhaps, quite extensively—and could tell us some things very useful to beginners. Then, too, if you are studying Botany, you can give us many good hints—telling all about the wild flowers that grow in the forests near your homes. I am not much of a botanist, but I like nothing better than going to the woods with my basket after plants and flowers, then analyzing them and studying their habits, peculiarities, etc. How eagerly I seek for new varieties—new to me, at least.

I have found several this spring that I never saw here before, though they are very common in some localities; the sweet little Trailing Arbutus I look for in vain. Year after year have I searched for it, but I have never found it here. Claytonia Caroliniana is indeed a Spring Beauty, and its rarity in this locality makes it doubly precious. It is a delicate little flower, requiring sharp eyes to discover, unless looking for "little things." The fragrant Hepaticas and large Bath Flowers you are all doubtless acquainted with. They are so conspicuous you cannot help seeing them, especially the latter. And now the Azalea or common Swamp Pink is delighting all lovers of wild flowers. Its bright, pink blossoms and delightful perfume make it a general favorite. There are many others equally worthy our attention, and time spent in acquiring a knowledge of flowers will never be misspent.

When we feel pretty well acquainted with them, they preach such graceful, truthful little sermons, that will almost unconsciously make us purer and better. Many lessons they teach us, if we are but willing to learn, and in their cheerful, unselfish lives set us good examples, and point us to the Land where flowers do not fade. Mab Morris.

MAXIMS FOR A YOUNG MAN.

Never be idle. If your hands cannot be usefully employed attend to the cultivation of your mind.

Always speak the truth.

Keep good company or none.

Make few promises.

Live up to your engagements.

Keep your own secrets if you have any.

When you speak to a person look him in the face.

Good company and good conversation are the very sinews of virtue.

Good character is above all things else.

Never listen to idle or loose conversation.

Your character cannot be essentially injured except by your own acts.

If any one speaks evil of you let your life be so virtuous that none will believe him.

Drink no intoxicating liquors.

Ever live, misfortunes excepted, within your income.

When you retire to bed think over what you have done during the day.

Never speak lightly of religion.

Make no haste to be rich if you would prosper.

Never play at any kind of game.

Never run in debt unless you see a way to get out again.

Never borrow if you can possibly avoid it.

Be just before you are generous.

Keep yourself innocent if you would be happy.

Save when you are young, to spend when you are old.

Never think that which you do for religion is time or money misspent.

Read some portions of the Bible every day.

The Puzzler.

ILLUSTRATED REBUS.

☞ Answer in two weeks.

HIDDEN TREES.

1. Ella, burn umber for the coloring.
2. Will Amelia be sociable?
3. A full arch was carried away by the storm.
4. Did he give you an opal, Minnie?
5. You will own your child.
6. Our Pal met Tony Graham yesterday.
7. I love ye with fervent devotion.
8. While in camp horrible sounds were heard.
9. Do not be echoing the distant sound.
10. The man with the mace dared not play.
11. "As pence make pounds," etc.
12. In yonder chest nuts you will find.
13. Otho rang every bell we passed.
14. You came up as I came down.
15. Did you ever drink spruce beer?

☞ Answer in two weeks. Little One.

SYNCOPATIONS.

1. Syncopate a bird, and leave a domestic animal.
2. An article of food, and leave an article of furniture.
3. A vehicle, and leave a domestic animal.
4. A coin, and leave a stamp.
5. Distress, and leave a household utensil.
6. A watercraft, and leave a small animal.
7. A burden, and leave a boy.
8. An article of food, and leave an ornament.
9. A machine for measuring time, and leave a fowl.
10. An article of clothing, and leave a dwelling.

☞ Answer in two weeks. Isola.

MISCELLANEOUS ENIGMA.

I am composed of 12 letters:

My 7, 10, 6, 12 a kind of earth.
My 4, 3, 8, 5 is a weight.
My 7, 11, 9, 1, is a small net.
My 1, 2, 11, 5 is a kind of earth.

My whole is the name of a noted historian.

☞ Answer in two weeks. Berbix.

PUZZLER ANSWERS.—July 15.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

THE latest advices from General Terry's command represent him as waiting for reinforcements and show the difficulty of communicating with General Crook. The report of Sitting Bull's death is not credited by Colonel Hughes, who brings this news from Terry's headquarters. Apparently the Indian campaign is at a standstill, and it is to be feared that the war will last many months unless the army is strengthened sufficiently to make the advance effective.

The Chief of the Bureau of Statistics furnishes the following statement of our imports and exports for the fiscal year ending June 30, 1876. The returns for June not being all in, the figures for that month are partly estimated:

Domestic exports of merchandise, specie value	$522,000,000
Foreign exports of merchandise, specie value	14,000,000
Total	$536,000,000
Imports of merchandise	460,000,000
Excess of exports over imports	$76,000,000
In the previous year the imports exceeded the exports by over	19,000,000
A favorable showing in 1876, as compared with 1875, of about	95,000,000
Our exports of specie and bullion in 1876 exceeded the imports by	53,000,000

The apple tree blight is unusually prevalent this season.

There are 250 sick children now in the Sanitarium at Sea View, on the Long Branch Railroad. They have been gathered from tenement houses by district visitors and the dispensary physicians. Most of them are sent there for a week, and it is wonderful to see the improvement made by generous diet, fresh air, sea-bathing and the abundant opportunity for rest and recreation. Life comes back where it seemed to be on the point of ebbing away, and strength is restored to pinched, weak limbs. The good work is under charge of the ladies of the West Side Relief Association, and they are untiring in their endeavors to so carry on the work as to decrease the infant mortality of our city. Just now they are specially desirous of enlarging their accommodations. By their present plans they are able to accommodate 400 children, and they are anxious (having the room there) to extend it till their colonies number 1,000. The expense of the present establishment is about $100 a day—a small amount in comparison with the good results achieved. Contributions for the Sanitarium may be sent to Henry King, Chairman, No. 403 West 29th St., or to Henry Bergh, Fourth Av. and 22d St.

Plowing in unbroken furrows six miles long can be seen in Fargo, California. The teams start in the morning and make one trip across an entire township and back before dinner, and the same in the afternoon, making twenty-four miles' travel every day.

The Boston City Directory, which has just been published, contains 129,308 names, a gain of 2,539 over last year. In preparing the volume 29,843 names were erased and 32,382 added.

The Buffalo Express predicts that the suspension bridge over the Niagara River is going to fall, one of these days, not from any defect in construction, but simply because iron suspended, either horizontally or vertically, ultimately becomes granulated and brittle, and in this state breaks easily by vibration, while to this change in structure is to be added the inevitable weakening of the iron by the alternate contraction by cold at a temperature of 22° below zero, and the expansion by a heat of 90° above zero.

Out of 244 business failures in Massachusetts during the first six months of the present year with an aggregate liability of $7,436,478, Boston contributed 164, the total liabilities of which were $7,426,200. This, so far as the State is concerned, is a gratifying decrease over the corresponding period of last year.

The difference in weight and cost of the rolling stock of the broad and narrow gauge railroads has been calculated as follows:—A locomotive, baggage car, Pullman palace car and four passenger cars on the Eastern Road give capacity for 230 passengers, weigh 138 tons and cost $63,000; one locomotive and six passenger cars on the Revere Beach & Lynn Road give capacity for 272 passengers, weigh fifty-eight tons and cost only $18,000. The difference in the cost of the roads is still more marked.

New Braunfels, the county seat of Comal Co., Texas, is a thrifty German settlement of about 5,000 population. With the industry and energy characteristic of that element, they have made that city so productive as to be almost independent of the outside world. Its woolen fabrics are of the finest quality. It has water-power adequate to almost any demand that may be made, and the vicinity will doubtless rival Lowell in a few years.

The Donaldson (La.) Chief says reports from the crops are of the most favorable and encouraging nature. The showers of the past fortnight have proved a great blessing, the more appreciated for having been so long delayed. The stand of plant cane has been and still is improving, while stubble is in a condition of advancement and luxuriance seldom attained. Corn, too, is doing well, and the general agricultural prospect is very fine indeed.

The first express train from Boston to Chicago passed through the Hoosac Tunnel July 17.

Crop Reports—Alabama: Cotton worms troublesome in Lowndes Co. Concerning the weather read as quoted:—"In this warm weather the country roads are of powdered dust; the bushes are as heavily white as if covered with hoar frost; the winking frog sits disconsolately where once was a puddle, but where is now a baked, cracked patch, and over it hangs a bouquet of motionless butterflies."

California: Wool clip disposed of with unusual rapidity. The grape crop is exceedingly promising. The vintage will, without doubt, exceed in quantity as well as quality any ever before gathered on the Pacific slope. The fruit supply is now very great, and the markets are glutted with apricots, peaches, berries, etc. The apricots are very fine and exceedingly plentiful, selling at about $1 per bushel, or 75 cents a basket. Canners are now actively engaged packing fruit in quantities.

Mississippi: For the first time in their history, red oats have the rust. It is confined to the low lands.

Crop reports are in many places less favorable. It is the same old story—drowned out in one place and parched up in another.

Dom Pedro, the Emperor of Brazil, has arrived at Queenstown, and, if he is true to his instincts, he is already examining the social and political condition of Ireland.

The Saratoga races were began July 25, much good sport was anticipated and realized. These races have a charm of their own, and Saratoga may be called the American Ascot.

Concerning the recent floods, we have the following from Shreveport, La. The weather is clear. The thermometer marks 97 degrees. Many plantations on the west side of the Old River are overflowed, and fears are entertained that all on that side will be submerged. The heavy rise here has alarmed the planters along the river immediately below here. The upper river at Fulton fell thirteen inches. The impression here is that every plantation between Fulton and the head of the raft is under water, though nothing has been heard from any of them since high water cut them off from the hills.

Wisner Murray, has died of pistol wounds received at the hands of R. H. Berdell. This is the sequel of the Goshen tradgedy in which three men assaulted their neighbor and kinsman with a view to punishing him severely for insulting his wife, and their relation.

A terrific gale passed over Lake Memphremagog on the afternoon of July 20th. The steamer Lady of the Lake, having 1,400 persons on board, narrowly escaped a serious disaster. The steeples of the Methodist Church, with its bell, was torn from the roof of the church and carried the whole length of the building. Trees were torn up by the roots, and great damage was done to crops.

The latest from Utah is that a choice party culled from Brigham Young's Danite Band of "Destroying Angels" waylaid and tried to murder Jno. C. Young a reporter on the Daily Tribune. The young man is a nephew of Brigham, and is extremely obnoxious to his uncle as the above would seem to indicate.

There has been an unusual immigration of California stock men to Arizona.

The Free Church Association of Philadelphia wishes to stop the sale of seats in churches.

A Methodist journal says that there are 4,173,047 members of the Methodist Church in the world.

The Committee of Conference on the Legislative, Executive and Judicial Appropriation bill have informally agreed upon a basis for settling their principal disagreements, as follows:—The reduction in the number of clerks to be about two-thirds of the number originally proposed by the House; the heads of the Executive departments to determine the classification of their respective clerical forces, and this conference committee to recommend that the salaries be fixed accordingly. The committee adjourned until Monday the 24th inst., and in the interval inquiries are to be made and information collected in the Executive departments, which it is hoped will lead to a final agreement on the basis above suggested.

Gen. Longstreet is to succeed Mr. Packard as U. S. Marshall for Louisiana.

Speaker Kerr is rapidly improving.

The largest single sale of blankets yet recorded were auctioned in New York city the 21st inst., 25,000 packages were sold realizing $400,000. The prices were lower than those obtained at similar sales last season.

The following telegram from President White explains itself:—Prof. Fiske, Cornell University. Fifty guns fired this afternoon. Give my congratulations to all and regrets that I cannot be with you.—A. D. WHITE, Syracuse, July 19th. The Cornell boys were again victorous at Saratoga this year, carrying off all the honors. It is unusual, in fact unprecedented for one college to win the University, Freshman and single-skull races at one and the same meeting. It is a glorious day for Cornell, and we congratulate Capt. Ostrom, the President, the faculty, everybody in fact. 'Rah for Cornell!

A liberty pole one hundred and seventy feet high made of jointed cylinders of Bessemer steel was erected a few days ago in Cleveland, O.

J. J. T., Atlanta, Ga., says:—Crop prospects are quite promising. Though the mercury ranges from 76 to 94° in the shade, corn, cotton, millet and other field and garden crops indicate good health and sturdy growth. Irish potatoes are matured and the yield abundant; they are selling in our market at 50c. ₩ bush. We are now putting in our second crop of potatoes on the same soil, which we find superior in quality to the first, and it keeps better in winter. During this and next week Rutabagas will be mainly planted, some persons preferring to sow seed in August. Never was our market more abundantly supplied with fresh vegetables, all of which sell at low prices. Rains are timely and ample for maturity and continued growth of early and late field and garden plants. Pear and apple culture has received an almost deadly blow this season. Blight set in early and held on long. Many of our finest trees are dead. But very few pear trees have escaped an attack.

A considerable portion of Shelburne Falls village, Mass., has been consumed by fire.

Congress still in session.

Work is to be resumed at once in the mines around Scranton, Pa.

To such straits have the poor been reduced in the neighborhood of Jersey City that the Mayor felt compelled in his Annual Message to warn the community of the imminence of bread riots.

About 5 o'clock on the evening of July 20 lightning struck and fired two receiving tanks at Dilke Station, on the West Philadelphia Railroad, containing 41,000 barrels of oil. The tanks are the property of Marcus Bronson of Titusville, Pa., and are used by and connected with the Union Pipe Company. The next morning another tank, containing about 20,000 barrels, situated about 200 feet from the burning tanks, was fired by an explosion which threw burning oil all over it. The loss of the tanks subjects the patrons of the line not having balance with the company to an assessment of about 10 per cent.

C. D. B., Port Ontario, N. Y., July 13, says: Haying has commenced, but the weather is uncertain,—has been very wet the past two weeks and some hay has been damaged, but little going into the barns without wetting. Crops of all kinds look well and the country beautiful. Potato beetles plenty and impertinent.

Prof. Marsh of Yale College has contracted with Dr. Field of Springfield, Mass., for the use of certain lands near that city, and has workmen engaged in quarrying out "bird tracks," some excellent specimens of which have been secured.

The Rev. John D. Blair, a leading member of the Newark Methodist Episcopal Conference, died July 18. He was one of the first Methodist ministers to California and established two churches in San Francisco.

A passenger train on the Denver and Rio Grande Railroad which left Pueblo for Denver encountered another of the many water spouts that have broken in Colorado Territory this season. When some ten miles out from Pueblo, Conductor Glascott noticed a a cloud of unusual appearance in the sky, seemingly hanging over the road and advancing in the direction of the train with great velocity. The next minute the entire train was enveloped in a deluge and the cars were flooded to a hight that covered the seats. The train was slacked, but the cloud had disappeared almost as suddenly as it had come, and it was then observed that portions of the track in front of the train had been swept away. In this emergency the train was backed to Pueblo.

On the afternoon of the 20th, a dreadful catastrophy sent a thrill of horror through this community. The details are so sad and peculiar that they possess more than a local interest. The yacht "Mohawk," owned by Mr. W. T. Garner, Vice-Commodore of the N. Y. Yacht Club, was preparing to leave her anchorage, off Staten Island, for a cruise down the bay. Mr. Garner, his wife, wife's brother, Miss Helen Hunt, Miss May and others formed the party. They left the Club House in the gayest spirits, and in less than five minutes after reaching the yacht, a squall arose, struck the vessel, and immediately twenty odd persons were precipitated into the seething waters, five of whom, including Mr. and Mrs. G., were drowned. The "Mohawk" was, in all respects, perhaps the most perfectly appointed, as she was undoubtedly the largest yacht in the world.

Divers subsequently went down into the vessel and succeeded in securing the bodies of the unfortunates, who were found, with two exceptions, buried under a pile of furniture and lead ballast. Mr. G. was about 40 years old, the senior partner of the firm of Garner & Co., one of the largest cotton and print mills firms in the country. His fortune is variously estimated to amount to from twenty to thirty millions of dollars.

At the inquest the two quartermasters of the yacht gave very decided testimony against the sailing master, Capt. Oliver P. Rowland, charging him with incompetency. They made no great impression on the jury, who exhonerated Rowland. Subsequently the yacht was raised and the position of her sails, which were fastened in the same position as when she went down, would seem to justify the criticism of the sailors, and things do not look so well for the captain as they might. Altogether it is a sad occurrence, and has deeply affected this community.

Senator Logan, who has charge of the bill for the equalization of bounties of those who served in the late war for the preservation of the Union, expects to have it considered by the Senate before the final adjournment. This bill passed at the last session of Congress an hour or two before the adjournment, the vote upon it in the Senate being a tie; but the late Vice-President Wilson gave the decisive vote in the affirmative. The President did not directly veto the bill, but simply allowed it to fall for want of his signature.

FOREIGN NOTES.

THE condition of the English and Scotch operatives in the mills is growing worse, and the reduction of wages is likely to become general. This will be followed by strikes and great suffering, and in the end the workmen will be worsted. The business depression is so severe it is to be feared that only starving labor will revive it.

The largest balloon ever dreamed of is the one that M. Godard purposes to make in Paris. It is to be over 100 feet in diameter, and will weigh 6,500 pounds. It will be held to the ground by a strong cable 2,000 feet long, and will take up fifty persons at one time. It is designed to contribute to the entertainment of the Exposition of 1878.

A Berlin mechanic has invented a steam velocipede which is said to answer admirably. The engine is heated with petroleum and, being placed on the two back wheels, does not interfere with the convenience of the driver.

They have got the mustang fever in England. A London paper advertises a "remarkable match against time," in which "Leon, a famous Mexican horseman, lasso thrower and ranger," would endeavor to ride ten mustangs one hundred miles in five hours.

The Bank of England clips every light sovereign that it receives. The weighing is done very quickly, 3,000 an hour being weighed by one machine. In 1875 the bank weighed £22,160,000 worth of coin, and rejected £840,000.

The London Farriers' Company offer a prize for the best essay on "The Veterinary Treatment and Practical Shoeing of Horses."

The Grecian Government is preparing a protest, should the Porte fulfill its intention of establishing a colony of 70,000 Circassians near the Greek frontier.

A special dispatch from Paris says the city of Paris loan has been covered seventy times over. Paris alone subscribed fifty times the required sum.

News from the seat of war in the East is of a very conflicting character, each side claiming victories.

Austria and Russia have addressed communications to the Powers respecting the recent meeting of the Czar and the Emperor Francis Joseph at Reichstadt and its results.

The following news is official:—"The Servian division which entered Turkey by way of Yenevaroch, was dispersed on the 12th inst. Seventy Christian families who fled from the neighborhood of Merrowitza with the Servian troops, surrendered after the defeat of the latter and were restored to their homes.

The latest telegrams from various sources are as follows:—A Berlin special says:—"At the Salzbury interview the Emperors William and Francis Joseph agreed that the maintenance of the policy of non-intervention was impossible in view of the massacres and bloodshed occurring."

All the powers except Russian have declared Roumania's demands unreasonable.

The Servian Minister, Milokovicz, has gone to Bucharest on a secet mission.

The Sclavistic committee in Moscow has issued an address solemnly promising a general uprising of Russians and armed intervention if the Servians are defeated.

A Belgrade mob has insulted the Austrian Consul-General.

The following news from Constantinople is official:—"A force of 5,000 Montenegrins attacked the Turkish post at Banzana. The Montenegrins, after a sanguinary engagement, fled to their intrenchments. They had 200 killed."

PARIS, July 23.—The rumor that the Emperor William had formed at Salzburg an unfavorable opinion relative to the maintenance to the peace of Europe, is denied. In well-informed circles it

is asserted that the Emperors exchanged the most pacific assurances at their conference.

The London Standard's correspondence at Osman Pasha's camp, twenty-five miles from Widdin, writing on Sunday, the 23d, says:—"All is quiet at present. The Servians remain on the Servian side of the Timok River. Cannon shots are occasionally exchanged, but the Turks will not probably attack until a general advance is made all along the line.

The Standard's Widdin telegram says the Turkish irregulars attacked the Servian camp at Bregova on Saturday morning. The fighting still continues.

The Standard's Vienna telegram says the persons who insulted the Austrian consul at Belgrade were employed by the Servian police.

Ten Turkish gunboats have been placed between Widdin and Floreutin on the Danube.

Intelligence from Sclavonic sources announces that the Servians were defeated near Beljina on Thursday. Mustapha Djelaldin Pasha and Sohlizeki Pasha, with seven battalions of infantry, four companies of cavalry and eight guns, attacked the Servians in their intrenchments at Raska, before Beljina, and after a four hours' sanguinary combat the Servians fled. The Turks captured four guns and four small forts.

The Paris *Journal des Debats* publishes a special dispatch from Semlin which affirms that the Servians were defeated before Beljina, and that Gen. Olimpic's line of retreat is cut off. The news of the Servian General Tchernaveff's defeat at Nissa and his withdrawal to Alexinatz is confirmed.

[Nissa (Nish, Naissus) has at all times been an important point of convergence. It is in the midst of a plain, evidently the basin of a large lake in remote ages. This plain forms a triangle, the point of which lies near the Servian frontier, where the Nishawa flows into the river Morava. The plain is fertile and well watered, but it is thinly inhabited, and contains more Arnaut and Circassion than Bulgarian settlements. The view of Nissa corresponds little to the ideas awakened by its military importance. The fortifications, partly erected by the Austrians during their occupation in 1737, are by no means imposing. The citadel lies on the right bank of the Nishawn, somewhat higher than the town on the left, and is connected with the latter by a fine bridge. A wall with six bastions connected by curtains surround the citadel, which is also provided with moats and ravines.]

SEMI-BUSINESS PARAGRAPHS.

The Centennial Trial of Mowers, Hay Rakes, Tedders and Loaders was held in our meadows, at Eddington Station, June 26th, 27th and 28th, 1876. Many Rakes were in competition. We examined their working closely, as we desired to buy. We decided to and did each buy a Wisner's Tiger as, in our judgment, its work was greatly superior to any other Rake on the field. Mr. WISNER received a large number of Rakes, all of which were sold at the close of the trial. Few if any Rakes of other styles can be sold in this locality another year.

GEO. W. EBERT,
PATRICK KILLIAN.

Eddington, Pa., July 11th, 1876.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 22, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	57,920	Molasses	—
Whisky	2,241	Rice, bbls	127
Corn meal, bbls	5,716	Cut meats, pkgs	8,662
Corn meal, bags	479	Lard, pkgs	2,151
Wheat, bush	368,630	Tobacco, hhds	3,873
Corn, bush	941,900	do. cases	6,981
Oats, bush	288,200	Butter, pkgs	15,853
Rye, bush	10,357	Cheese, bxs	93,614
Malt, bush	56,407	Cotton, bales	6,731
Barley, bush	9,013	Rosin	5,583
Beans, bbls	2,724	Spts. turp., bbls	962
Grass seed, bush	6	Dried Fruits, pkgs	5
Beef, pkgs	1,566	Eggs, bbls	6,653
Wool, bales	3,520	Peanuts, bags	733
Hops, bales	431	Leather, sides	73,230
Pork, bbls	643	Sugar, hhds	—
Tallow	1,193	Oil cake	8,284

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 1,527 bbls.; since Jan. 1st, 37,535 do.; same time last year, 18,138 do. Exports of peas past week, 40,077 bush.; since Jan. 1st, 467,026 do.; same time last year, 225,810.

Strictly speaking, there is no bean market. Now and then a round sale is reported, but it is induced by the very low prices that are ruling, even for prime, well kept stock. It is thought a good deal of stock will turn out moldy or otherwise unsalable, owing to the extreme heat. Mediums are quoted at 95c. as extreme. Pea beans and white kidneys are quiet; red kidneys have a fair trade; few are prime enough to bring more than $1.10. There has been quite a movement in Canadian peas, which has stiffened the price. Green peas very quiet.

Beans—Prime pea, $1.20@1.25; fair to good, $1.00@$1.10; prime mediums, 100@95c.; fair to good, 70@80c.; poor, 10@50c.; prime marrows, $1.33@1.37; fair to good, $1.10@1 20; prime white kid., $1.20@1.30; other, $1.00@1 10; prime red kidney, $1.30@1.40; other, $1.15@1.25; Lima (Cal.), $2.75@3. Black beans, $3.75@4. Peas—Canadian, in bulk and bond, 95@85c.; green, $1.00@1.10; Southern B. E., 2-bush. bag, $2.65@2.70; split, $ bbl., $6.

BUTTER.—Supplies are moderate as the hot weather has checked shipments, especially of State. There has been a fair volume of trade during the week, buyers having been out of market so long they have been forced to replenish stock. The scarcity of fine makes upper grades rather firm but there is no immediate prospect of high prices. The dry weather impoverishes the yield in the river and adjacent counties; besides the contracts and demand for pure cream for table use are very large this season. Some large creameries which formerly gave us a regular supply of fresh summer butter are relieved of the trouble of churning by the enlarged wants of this city and Philadelphia. Sales of Western have been quite liberal for European export. We would not advise heavy receipts from any point until butter can be at least carted from the stations with safety. The weather has been so hot that samples could be almost poured out. After butter has been in such soft condition it is difficult to harden it back to its full former good quality. At the close we may remark that the new prices for choice are firm.

We quote:—Choice pails, 26@27c.; prime, 24@25c.; poor to good, 18@23c.; creamery pails, choice, 27@28c.; good, 25@26c.; sweet cream pails, 25@26c. State firkins, choice, 26@27c.; fair to good, 22@23c.; do. half firkin tubs, choice, 25@26c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 23@24c.; other, 19@21c.; Western creamery, choice, 24@26c.; other, 21@23c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 18@19c.; other, 12@14c.; factory choice, 16@17c.; other, 12@13c.

CHEESE.—The market has been in very poor shape this week. With the very warm weather arrivals large and in good part out of condition, together with lower and weak English markets, and disinclination in consequence among exporters to operate unless at low figures much reduced prices have been made. The bulk of the business has been at 9@9¼c. for best factories chiefly at the lower figures, with anything off from the almost at once to 8c.

Now at 9@9¼c. for fine factory; 8@8½c. for good; 7½@7¾c. for fair; do., half skimmed, 5@7c.; do., skimmed, 3@5c. State farm dairy, 8@8¾c.; good to prime, 7@8c.; fair to good, 6@7c.; Western factory, good and prime, 7@8c.; fair lots, 6@7c.; do. cheddar, choice, 8@8¾c.; do. flat, choice, 8@8¾c. Exports past week, 75,404 boxes.

COTTON.—There has been very little done for shipment through the week and prices generally weak; closing prices are:

July, 11 23-32@11¾c.; August, 11¾c.; September, 11¾@11 21-32c.; October, 11 13-32@11 7-16c.; November, 11 5-16@11 11-32c.; December, 11 1-32@11¾c.; January, 11 15-32@11¾c.; February, 11¾@11 21-32c.; March, 11 25-32@11 13-16c.; April, 11 15-16@11 31-32c.; May, 12 3-32@12¼c.; June, 12¼@12 9-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	8¼	8¼	8¼	8¼
Strict ordinary	9 1-16	9 1-16	9 1-16	9 1-16
Good ordinary	9¾	9¾	9¾	9¾

Stained.

Good ordinary	8 5-16	Low middling	9 15-16
Strict ordinary	8 7-16	Middling	10 15-16

DRIED FRUITS.—The market is depressed and very dull. There was some movement in apples early in the week on Western account at steady rates, some which only small lots placed.

Apples—State, sliced, 8@8½c.; do., quarters, 7¾@8¼c.; Southern sliced, 8@8½c. for prime; Blackberries, 8¼c. Peeled peaches, good and prime Georgia, 10@12c.; do. fancy, 13c. Unpeeled peaches, new, 10@11¾c. for halves and 9@9¾c. for quarters. Plums, 12@13c. Raspberries, 24@25c. Cherries, 15c.

EGGS.—Prices are better for eggs, but the advance is not enough to compensate for the heavy losses that are showing in the count of all marks. Some of the late arrivals have not paid freight expenses. There was never before so severe a season for this perishable product. Canadian stock is the most sought for. Remote Western are not looked at. To-day weather cooler. We quote, loss off:

Near points, 21@22c., State and Penn., 19@20c.; Western, prime 18 [illegible] do other, 16@17½c.; Canadian, 18@18½c.

ESSENTIAL OILS.—Oil Peppermint, in glass, $3.75 ; in tin, $3.25. Spearmint, in glass, $3.50; in tin, $3. Wintergreen, $3. Sassafras, 75c.

FEATHERS.—Quiet. We quote prime live Western geese, 52@55c.; [illegible] do., 35@45c.

FLOUR.—Prices are lower and a very depressed market. A good many parcels are placed at almost any reasonable price, on account of the injury by the warm weather, and a pressure to sell generally.

For poor to very choice superfine State, $3@3.90; $4.5 [illegible]4.40 for very common to fair extra do.; $4.50@5.00 for good extra do.; $4.60@5.00 for fancy do., and $5.05@6.50 for very choice extra; $3.00@3.90 for superfine Michigan Indiana, Iowa, &c.; $4.00@4.50 for shipping extra do., the inside price for inferior, and $4.55@4.75 for choice to very fancy extra do.; good to choice white wheat extras at $4.80@6.50; fancy do. $6.05@7.05; winter wheat, good to choice family city mill extras, $7.25@8.50, round-hoop Ohio, $4.40@4.80, and trade brands of do. at $4.85@6.75; St. Louis, $4.90@6.00 for common to fair extra, and $6.05@8.50 for good to very choice; Minnesota "straight" at $5.00@5.50, and patent at $5.25@8.50; unsound stock at from $2.50@5.00; No. 2 at $4.90@2.70; city mill at $4.80@6.00. Southern at $4.55@5.00 for common to good extra, $5.05@5.75 for good to choice; $5.80@8 for common to choice family extra.

FRESH FRUITS.—This part of the season is never a favorable one for fruit. Buyers have had by this a surfeit of berries and trade is not apt to be general for green apples and windfall pears with the weather prompting special care in diet. Virginia had but few peaches to send this season. Maryland is sending a few crates of Hale's Early and Early Beatrice—new. Blackberries are fine and very cheap. Whortleberries are in good demand. Watermelons are active when prime; the early arrivals are not first-class this season. California fruit will come along regularly. The latest offering was of plums at $5@9 ₱ box for Washington and Magnum Bonum. A few good early pears are in market. Apples are abundant and very low. Peanuts dull. We quote:

Apples, Sweet Bough, ₱ bbl., $1@1,50; sour, do., $1@1,50; Red Astrachan, $1.50@3; common, 50@75c. Pears, best, $3.50@3; small, $1@2.75. Peaches, crate, choice, $3@4; other, $1@2.50. Blackberries, cultivated, ₱ quart, 12@15c. Raspberries, Antwerp, 3@4c.; Philadelphia, 4@5c. Whortleberries, ₱ bush., $2@2.50. Currants, small, 4@5c.; do. cherry, 6@8c.; black, 8@9c. Muskmelons, ₱ bbl., $1@3. Watermelons, Georgia, $30@50 per 100; North Carolina and Virginia, $10@25. Hot-house grapes, lb., 75c.@$1 for Black Hamburg. Peanuts—Virginia, bush., $1.50@1.75; Wilmington, $1.50@1.90; Tennessee, 90c.@$1.05.

GRAIN.—The market for wheat has probably never been in worse shape than during the past week. With advices from the other side of dull and steadily declining markets and no orders of consequence coming to hand, in connection with the warm weather, which has injured supplies in store materially, there has been an unusual pressure to sell while it was almost impossible to sell, and the result, very low prices. Latest sales are:

No. 3 Chicago spring, 80@85c.; No. 3 Milwaukee do., 83@85c.; No. 2 Chicago do., 93c.; No. 2 Milwaukee spring, $1; No. 1 spring at $1.12@1.18; soft, $1.11; small lots winter red Western at 85@87c.; new amber Delaware, $1.20. Rye at 50@71c. for Western; 75@78c. for Canada and 70@78c. for State. Corn is unsettled and fairly active; latest sales at 60@13c. for hot and heated mixed Western; N. Y. steamer, 50@51c.; 53½@54c., chiefly for export at the latter price, for New York graded mixed, and 49@55c. for ungraded; N. Y. No. 1 mixed, 53½c.; 55@56. for high mixed and yellow. Oats are lower and dull; latest sales at 25@33c. for mixed Western and State; 32@45c. for white do., including New York No. 2 at 30½c.; N. Y. No. 2 white, 32c.; N. Y. No. 1, 38c.; mixed Western, 32@35c.; State, 36@38c.; white Western, 31@43½c.; State, 40@ 0c.

HAY AND STRAW.—Supplies are more liberal of new and prices are weak. Straw is moderately active and unchanged.

Baled hay is quoted:—Shipping, 60@65c.; retail qualities 80@95c.; clover, 50@55c.; salt, 55@65c. Straw is quoted at 80@90c. for long rye; 60@65c. for short rye; 45@60c. for oat.

Exports past week, 714 bales; since Jan. 1st, 31,324 do.; same time last year, 27,026.

HIGHWINES.—Is hard to sell, and lower; quoted at $1.12¼.

HOPS.—There is very little doing. Export trade has come to a pause, and brewers are doing but little. The warm weather has had effect upon the vine in some sections, and there are reports of injury by lice, not sufficient damage, however, to cause material concern. We quote:

N. Y. State, 10@17c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c., ₱ lb.

OIL CAKE.—Western selling at $30 per ton.

LEATHER.—Hemlock sole at 19@20c. for light; 21@23c. for middle; 21@23c. for heavy.

POULTRY AND GAME.—Very little dressed arrives while the weather is so hot. Good live fowls have a fair demand. Chickens are active for hotel use, but a large supply puts them lower. Turkeys not wanted. We quote dressed fowls, 17@20c. Spring chickens, 25@30c. Turkeys, 11@18c.

Fowls, N. J., ₱ lb 17@18c.; do. Western, 17@—c. Roosters, 10@12c.; Turkeys, N. J. 13@16c.; do. Western, 13@15c.; Ducks, N. J., pair, $50c.@1; do. Western: 60@70c.; Geese, N. J., $2.00@2 50; do. Western, 1.25@1.75c. Spring chickens—Western, 20@24c.; do. N. J. 21@22c.

Game is not active. Woodcock quoted at 75@85c. ₱ pair for Western and State. Stall-fed pigeons, $1@1.50 per doz.

PROVISIONS.—There is a very depressed market. This is owing to the demoralization in the West, where the market has worked partly in sympathy with the break in wheat values. Mess pork quoted at $20 for spot lots; $19.80 for August and $19.90 for September. Bacon at 10¼c. for long clear. Lard at $11.25@11.35 for spot lots; $11.30 for August; $11.42½ for September. Stearine at 13½c. for choice Western. Beef hams at $30 for choice. Southern tallow at 8½c. for prime. Beef at $9@10 for plain mess; and $10@12 for extra mess.

SALT.—Quoted at $2.50 for Ashton; $1.25@1.40 for other brands.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—There are very full stocks here but, notwithstanding export trade for the present is light, prices are held as before.

VEGETABLES.—The best potatoes are now from Long Island; quoted $2.75@3.50 ₱ bbl. Virginia are used up. New Jersey quoted at $2.50@2.75. Garden truck not active; prices weak for anything plenty. We quote:—Green corn, ₱ 100, 60c.@$1. Norfolk tomatoes, poor, 50@75c. ₱ crate; Long Island, bush., $1.25@1.50. Marrow squash, bbl., $1.50@2.00; yellow crook, $1.50@2. Wax beans, bag, $2.50@3; Lima do., bag, $4@6. Cucumbers, L. I., ₱ 100, $1.50@1.75. Turnips, Russia, ₱ bbl., $1@1.25. Cabbages, L. I., $6@10 ₱ 100. Potato onions, $1.50@2.50 ₱ bbl.

WOOL.—There has been very little done this week; this has been owing chiefly to the prolonged auction sales of goods taking attention of the trade, together with the fact that the prices realized for goods were not altogether up to the mark anticipated, with the absence of important business the market is left in an entirely nominal position, a few lots of new Western fleeces have been received for which 31@36c. quoted for X and XX Ohio; 29@31c. for Mich.; and 30@32c. for Wisconsin.

ROCHESTER, July 22.—Flour market dull; spring, $6.50; amber winter, $6.75; white winter, $7.00; double extra, $7.25. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.10@1.20; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@35c. Corn quiet at 58@62c. Corn meal, $1.50@1.75. Butter, 13@21c. Cheese, 11@13c. Eggs, 13@14c. Lard, 11@12½c. Apples, bu., 75c.@$1. Potatoes, bu., 80c.@$1. Beans, ₱ bu., 50@90c. Mess pork, $20 50. Wool, 30@36c. Hay, $8@13. Straw, $6@8. Timothy seed, $2.30@3.; clover, $9.50@10. Mill feed dull at $12 for shorts, $14 for shipstuffs, and $17 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c.

BEEVES.—Trade on last Monday was still more slow, and prices reduced yet another ½c. ₱ lb. on the closing rates of the past week. Sales were effected at 8½@10½c. ₱ lb., with $1 off ₱ head on the top prices; weights, 1¼@10 cwt., strong. The herds to hand were from poor to good, being generally coarse but fat. Wednesday, trade stationary, scant, at 8@10½c. ₱ lb.; a few car loads remained unsold at noon. Thursday, trade very small, at 9@10¾c. ₱ lb.; weights, 4½@8½c. Friday, prices were 7@10½c. ₱ lb.; weights, 5½@8c. From 55@57 lbs., net, have been allowed. By far the larger part of the herds to hand were of coarse quality, but, being fat, obtained 56c lbs., net. Texan steers, very lean and coarse, sold at 7@8c. ₱ lb. Native steers sold at 8@10c., including 100 head of Kansas cattle that sold at 9½@10½c. ₱ lb. Grade steers very scarce, sold at 10½@11c. ₱ lb. Bulls, live weight, 4@4½c. Oxen, quality rough, sold at 8½@9½c. ₱ lb.

MILCH COWS.—Trade still slow, and quality not good enough to meet the demand. Sixteen cows sold at $40@50 ₱ head. Nineteen cows at $50@65 ₱ head. Twenty-three cows at $55@75 ₱ head. Nine cows at $60@70 ₱ head—calves always included.

VEALS AND CALVES.—On a heavy run of ordinary quality calves, sales have been slow at 5@7¾c. ₱ lb. Smooth quality veals scarce and in fair demand at 7¾@8½c. ₱ lb.; buttermilk-fed calves slow at 3½@5c. ₱ lb.; grass-fed, do., very dull, quality being poor, at $4@6.75 ₱ head. State calves sold at 3½@7½c. ₱ lb. State veals at 7½@8½c. ₱ lb. Pennsylvania, 7@8½c. ₱ lb., including a few calves. Virginia calves, 6c. ₱ lb. Jersey veals, 8½@9c. ₱ lb.; Pennsylvania, do., 8c. ₱ lb.

SHEEP AND LAMBS.—Trade extremely slow, with a decrease of ½c. ₱ lb. on both sheep and lambs, Monday last, sheep sold at 4@5½c. ₱ lb.; lambs at 5½@8½c. Wednesday, sheep, 3½@5½c.; lambs, 5½@8½c. Thursday, sheep, 3½@5½c.; lambs, 7¼@8½c. Friday, sheep, 4@5c.; lambs, 6¼@7½c. The markets closed weak; quality of these flocks, as above quoted, has been from coarse to good. Ewes and bucks sold at 3½@4½c. ₱ lb.; State sheep, 4@4½c.; Kentucky, 4½@5½c.; Ohio, 4½@5½c. Canada lambs, 7@7½c.; Kentucky, 6¾@7½c.; Jersey, 7½@8½c.; Virginia, 6¾@8c.; State, do., 6¾@7¾c.

HOGS.—A few head of Ohio hogs, live weight, were sold at 7½c. ₱ lb.; city dressed, on a more liberal supply, have fallen off in rates and in demand. Prices have been 8¾@8¾c. ₱ lb., light pigs included.

HORSE MARKET.—The extreme heat of the weather has caused a great depression in city trade prices of horses sold. They have been on the basis of our last report, but quotations have been so few that we withhold those obtained. Thirty horses arrived ₱ Erie Railway via. Oak Cliff Station.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., July 22, 1876.

THE market continues dull, with another notch downward in the scale of prices. The extremely hot weather and the fact that cheese is liable to get out of order if held at the factories doubtless have their influence on the trade. The delivery of farm dairies was about 500 boxes. Sales were made at 8@9 c., only a few choice lots reaching the last figure, the bulk of sales going at 8½@8¾c. Factories were well represented, the offerings aggregating upward of 10,000 boxes, a large share of which changed hands; prices ranged from 9 to 9¾c., only a few fancy lots bringing the latter figure. The bulk of sales was at 9¼c., which was considered top price.

The weather is too hot for the shipment of butter, and the delivery this week has been light. The rates paid for farm dairy butter have ranged from 20 to 22c., and for creamery 23c. was offered, but no sales were reported.

Farmers are busy at the hay harvest, and the crop is said to be much lighter than last year. Pastures are excellent and cows are doing well for the season.

We have advices from abroad for the first week in July. Our London correspondent reports the quality of American cheese as good and prices unusually low. American cheese now monopolizes the great bulk of trade and warehouses are well cleared. English cheese of fancy quality is scarce and dear. We give quotations:

American, extra fine, 56c.; fine, 52@54s.; good, 44@48s.; common and low grades, 36@40s. English cheddar sells for 84@96s.; Wiltshire double, 70@78s.; Cheshire medium, 45@56s.; fine, 76@80s.; Scotch, 60@66s. Dutch cheese—Edams, 56@58s; Gondus, 52@54s.; Derby shape, 30@32s.

The warm weather tells unfavorably on the foreign stock of butter, which has been pressed on buyers at comparatively low rates. There is rather more doing in Irish butter. We give prices as follows:

Clonmels, 124@126s.; Corks, 127s.; Dorsets, 136s.; Jersey, 104@108s.; Normandy, 116@126s.; American and Canadian, 90@100s. Oleomargarine, or artificial butter, sells for 74@104s. ₱ cwt.

The following letter from Utah speaks well for "Wisner's Tiger" Horse Rake:

"SALT LAKE CITY, Utah, July 14.

"JOHN STODDARD & Co., Dayton, Ohio—Gents: I have sold out my entire car-load of 'Wisner Tiger' rakes and want more. The 'Tiger' takes the lead here most emphatically.

"Yours, HOWARD."

THE Sioux Indians have to stop fighting and go back to the reservation for more ammunition. N. B. The ammunition on the reservation is furnished by the Government.

LONGFELLOW visited Wellesley College the other day, and eight girls rowed him across the lake in a way that made the old poet wish he was a gay young man multiplied by eight.

A BEAUTIFUL photo-miniature of the late Charlotte Cushman, by Miss Lizzie Cummings, in Memorial Hall, is daily surrounded by a crowd of the admirers of the great actress.

THE new Sultan of Turkey spends the greater part of his time at Yildis Kiosk (the Palace of the Stars), which is cooler and quieter than Dolmabagtche, and is surrounded by delightful gardens.

There's a place that is warmer than this,
Where never a collar can stand,
Where you only can bubble and siss—
Will you come to that beautiful land?

THE right-hand assistant of the savage Sitting Bull is said to be a half-breed Sandwich Islander, who speaks a half-dozen modern languages, and all the Indian dialects, and is a man full of cunning.

MR. AIR is the name of an hotel clerk, and it isn't inappropriate either.—[*New York Commercial Advertiser.*] Don't Boreas with any more like that, or we may come to "blows."—[*Norristown Herald.*

A BROTHER of Charles Bradlaugh has just been converted from atheism to Protestantism, and is holding open-air meetings in London, which are said to be as interesting as those held by Moody and Sankey.

WHAT a mother lacks in skill she makes up in enthusiasm when she cuts her boy's hair. The back of his head may look like thunder, but every scollop is a bright vision of devoted affection to the understanding mind.

THE following, from a Chicago source, may be received with some reserve:—"Last Tuesday, while a St. Louis young woman was putting on a pair of ball-slippers, she found a missing sealskin jacket in the toe of one of them."

"MY SON," said an affectionate mother to her son, who resided at a little distance and expected in a short time to be married, "you are getting very thin." "Yes, mother," he replied, "I am, and when I come next I think you will see my rib."

THE songstress, Ilma de Murska, "married, widowed and robbed" in Australia a few weeks since, is united again in the bands of wedlock—this time also in Australia, and to Mr. John Hill, another pianist. Some people can't keep unmarried.

MLLE. ALBINI, according to the London papers, is to be married at the close of the present London opera season, to Mr. Ernest Gye, son of her opera manager. She has been engaged to him for three years past, and he accompanied her in her operatic tour to this country.

Now is the time when the college graduate comes into the newspaper office to know if he can't get a job as a dramatic critic, correspondent at the Centennial or in Europe, city editor, managing editor, or, if nothing else is vacant, he would take the proprietorship.

MR. FREEMAN, the well-known English literateur, visited Sille-le-Guillaune not long ago to obtain materials for his "Life of William the Conqueror," and, being mistaken by an astute *garde champetre* for a Prussian spy taking notes with sinister intent, was arrested and had some difficulty in regaining his liberty.

IF you have money to invest, don't put it in New York real estate. Prof. Merriman states that by a reversion in polar conditions in ten thousand years from now New York will be two hundred and fifty feet under water. And no man could live two hundred and fifty feet under water many weeks without catching a dangerous cold.

MR. HOTCHKISS, one of the ablest of Connecticut journalists, retires from the Hartford Courant, and is to be connected with the Charter Oak Life Insurance Company. Nominally the city editor of the Courant for fifteen years, he was so versatile and so vigorous that he overflowed into other fields, and was to a very large extent its State editor and often its political editor also. He is a good deal of politician anyway, and is not likely to keep his fingers off the wires in his new life.—*Springfield Republican*

$1,000 Challenge $1,000
Wilbur's Direct Draft Mower is the lightest draft Mower in the world. Will cut more grass than any side draft Mower. Leaves grass in better position to cure. Enables the farmer to make a better quality of hay—is the most economical Mower the farmer can use. The Eureka shows a new *departure*—a new principle. It shows many points of superiority over side-cut machines. We challenge side-cut machine manufacturers to mow 50 acres with us, in competition, on the above points, for $1,000.

ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

ANSWERS TO CORRESPONDENTS.

Florida Orange Grower.—The small white, cottony excrescences, or specks, found on your orange trees contain the well-known Mealy bugs, which are often very destructive to plants cultivated in greenhouses, as well as to orange and lemon groves in the South. They are readily destroyed by syringing the trees with water heated to 130° Fahrenheit, or by applications of high-proof whisky or alcohol. The latter may be applied quite rapidly with a brush, and it is neither an expensive nor tedious operation, if performed before the trees are entirely covered with this pest.

Subscriber.—The only American work on Beet Root Sugar-Making with which we are at all familiar is that of E. B. GRANT, published by LEE & SHEPARD, Boston, Mass. This book contains much of the practical information which you would find in the French works on the subject.

Young Farmer.—There are, it is said, 2,260,000 farms in the United States, and as the greater part are owned by men, we can safely estimate the farmers of the country at two and a half millions. But if we count grown-up sons and hired laborers upon the farms as "farmers," then the number should be at least multiplied by three.

Miss B. R.—We cannot tell why your RURALS reach you so irregularly. They are mailed from this office "on time" each week. Our system of mailing is so perfect that it is impossible to miss a subscriber's name. We presume that P. O. clerks are frequently none too good to "cabbage" so good a newspaper as the RURAL NEW-YORKER. Hence copies frequently fail to reach our subscribers.

Young Bee Keeper.—It may seem strange to you that intelligent men and women should be so superstitious as to believe that selling a swarm of bees would surely bring "bad luck" to the family of the seller. Still we can remember when not to believe in such nonsense was almost equal to being a scoffer at sacred things, and it was also quite a common custom for the heads of the house, either the husband or wife, to visit the apiary after a death in the family and inform the bees of the solemn occurrence. We have been gravely assured by believers in such mummery that to neglect to inform the bees of a death in the family would surely result in the abandonment of every hive. There are bee keepers not a hundred miles from this great city who still steadfastly adhere to the above superstitious beliefs and practices.

Emigrant.—The statistics to which you refer, giving the number of inches of water falling in rain during the year, are no guide whatever in determining the humidity of the climate or its adaptability to the growth of vegetation. These tables do answer very well as advertisements for land agents and that is all. One State may receive fifty inches of rainfall, another twenty-five, and at the same time the former have such a dry climate as to be unfit for agriculture, while the latter will be called a moist and delightful one. You may notice that vital points in all these statistics is kept out, viz., how, when and what kind of weather follows the showers. A half inch of water falling in a gentle rain, continuing two or three days, followed by still weather, is worth more and will do more good than three inches falling within one or two hours and succeeded by high winds. Then again; rain, to be of most value to the agriculturist, must fall during the growing seasons of plants and not when everything is in a dormant state. It also often occurs that the amount of rain falling in one part of a State is far in excess or less than in another; and this is especially the case in the larger States which extend over a distance of several hundred miles east and west or north and south—for instance, New York, Illinois and Kansas. The meteorological station where the measurements are made may be favorably or unfavorably situated for giving a fair average.

Marcus.—I live ten miles from N. Y. City in New Jersey. I wish to make my walks about the house hard, without much cost. Will you tell me, through the RURAL, how I can do it?

ANS.—This is a question which we have often asked ourselves without ever receiving a satisfactory reply. Coal ashes, sand, such as is used for mortar, and clay in the proportion of rather more sand than coal ashes—the difference made up with the clay—all well-mixed together and laid at least four inches deep, will become very compact and hard. Macadamized paths are to be recommended in point of cheapness. Collect all the stones you can. Place the large in the bottom and fill in with the smaller ones, covering, as above, with sand, ashes and a little clay.

J. W. B.—We were aware that you had offered the *Dioscorea batatas* as the "Cinnamon Vine," and we have already said that this immediately suggested itself upon reading the description of our Mo. correspondent. But familiar names are frequently no guide whatever in determining botanical names, as in the instance of the Wandering Jew, which has been given to upwards of seventy-five different plants.

We thank J. W. B. for his inclosures.

X., Brooklyn.—I have read or heard that a goblet, if filled with water, might be inverted if a piece of paper were placed over it. This I have tried many times without success. Is it a fact? If so, tell me why I cannot succeed.

ANS.—It *is* a fact. The goblet must be filled so that every particle of air be excluded between the water and the paper. Then holding the left hand upon the paper, invert it as quickly as possible with a sweeping, circular movement, and carefully remove the hand. Of course tender paper, or paper that at once absorbs the water, will not answer the purpose. The philosophy of the thing is simply that the air presses equally in all directions. If the column of water in the goblet were heavier than the pressure of the atmosphere upon the same area, the water could not thus be held.

A., Binghampton.—"A friend and myself disagree as follows: He thinks for ventilating a sleeping apartment the window should be raised at the bottom. I think it should be lowered at the top. We have agreed to submit it to the RURAL."

ANS.—The exhalations from the body are more or less impregnated with impurities, and these, as soon as they lose the heat of the body, are heavier than the air and sink therefore, and mingle with the lower air. It is so with the breath, which is more or less charged with carbonic acid gas, which, being heavier than atmospheric air, sinks to the floor. Hence the bottom of wells will not support combustion.

Heated air is not necessarily impure. The impression that it is, is probably derived from the fact that the air near ceilings, or in the upper tiers of public buildings, seems hot and oppressive. In winter we desire to preserve the heat; in summer we desire to get rid of it. For the latter, therefore, both top and bottom ventilation should be secured—the top for the heat to pass off; the bottom for the impurities. In winter, we should say, that bottom ventilation is alone desirable.

A Rural Reader, Northville.—The leaves you send are those of *Iberis*. The minute flowers were so pressed that, except for the leaves which in this genus bear several distinctive marks, we could not have determined even its generic name.

Let us here beg the attention of our friends who may have occasion to forward plants for names. In tracing plants, not only the dried flower but the essential parts of the flower are necessary, viz., the calyx, petals, stamens, pistils and ovary. Placed within the folds of a letter, these parts are usually as flattened as tissue paper when they reach us, and it is next to impossible to distinguish those parts. If our correspondents would place the flowers, leaves, etc., in a paper box, or indeed in a little cotton, so as to prevent the parts from being glued, as it were, together, it would save us a deal of trouble and time. Let our correspondents feel assured that we are always happy to name plants, when we can. If, however, they would observe the above precaution, we could ofttimes name the variety and specific name, which, without this precaution, we can not pretend to do.

Young Reformer.—It is certainly commendable to try to bring about a reform in the matter of bad habits, but do not be too sure that you are right and that all who disagree with you are wrong. For instance, you claim that if "the $30,000,000 worth of tobacco annually produced could be struck out of existence, the country would be all the richer and better for the loss." But if you will stop a moment to think of the hundreds and thousands of men, women and children who are made happy with the money earned in raising and manufacturing the filthy weed, you must see that there are blessings accompanying the evil. Perhaps you may say, "Let them raise corn, wheat, potatoes and other more useful plants, in place of tobacco." True enough; but this would bring the prices of those necessaries still lower in the market—a result which might cause more distress among our agriculturists than you or any one else would like to see. The great trouble with "young reformers," as well as old, is that they are mainly what we may term "one-idea" people, lacking the talents which would enable them to take a broad and comprehensive view of any subject in all its bearings. In other words, they get the idea into their little heads that their special mission on earth is to cause everybody to think and act in accordance with their notions of propriety, whether right or wrong.

Emily.—The plant marked A. is *Rivina humilis*. It grows from seeds very readily. B. is *Teucrium Canadense*. The other plant we could perhaps name, if you send the leaf and stem—but your description of the flower applies as well to a hundred others. Perhaps it has formed seeds; if so, send them.

Agents Wanted.

AGENTS WANTED FOR THE GREAT
CENTENNIAL HISTORY
It sells faster than any other book ever published. One Agent sold 61 copies in one day. Send for our extra terms to Agents. *National Pub. Co.*, Phila., Pa.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Traveler's Guide.

JOHN CRUMP, - - Proprietor,
Chestnut St., cor. 15th,
PHILADELPHIA.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to
MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

Wit and Humor.

SPARKS AND SPLINTERS.

ARTIFICIAL humbugs—Girls.

FASHIONABLE ears—Panniers.

A REGULAR hum-bug—The bee.

IN the tanning business—The sun.

COUNTER-CLAIMS—Your wife's shopping bills.

AT the Eden trading-post the devil was Subtler.

HEARTY laugh—One that gets down among the ribs.

THE most inquisitive of ancient divinities—Tellus.

SUSPENDED Animation—A spider hanging at the end of a web.

A BORN chiropodist—The boy who is always at the foot of his class.

A MAN'S credit must be bad indeed when he can't borrow trouble.

WHEN parents yield up their daughters in marriage they do it with miss-givens.

"'Tis false," as the girl said when her lover told her that she had beautiful hair.

WHY is dew like a falling star? One is mist on earth and the other missed from heaven.

THE extreme hight of misery is a small boy with a new pair of boots and no mud puddle.

THERE is a great falling off of little boys who try to ride on the behind end of a street car.

WHY may a tipsy man fall into the river with impunity? Because he won't drown as long as his head swims.

IT isn't safe now to set any man to watch a straw in a claret punch unless you stand by and help him watch it.

THE man who will starve to death with strawberries at seven cents a quart has no ambition worth mentioning.

AN author said that one of the uses of adversity is to bring us out. That is true, particularly at the knees and elbows.

WHILE one hymn book is good enough for a pair of lovers, it takes two to supply them with music after they are married.

"MAMMA can a door speak?" "Certainly not, my dear." "Then, why did you tell Ann, this morning, to answer the door?"

"THERE! that explains where my clothes-line went to!" exclaims an Iowa woman, as she found her husband hanging in the stable.

INGENIOUS youth—"Oh, yes I dare say she's very clever and all that, but I hate clever women, and so I've come to talk with you!"

IT was when Tennyson stopped to scratch his back against a gate post that he sighed, "But, oh, for the touch of a vanished hand."

"MADAM," said a gentleman to his wife "let me tell you facts are very stubborn things." "What a fact you must be," quoth the lady.

WHEN a black ant crawls up inside the tenor's pantaloons on Sunday, the simplest solo requires such an effort of will as few people have any idea of.

TOM MOORE compares love to a potato, "because it shoots from the eye." "Or rather," exclaimed Byron, "because it becomes all the less by paring."

"Is the moon made of green cheese, youngster?" "No, sir, certainly not." "How do you prove that?" "Oh, easy—the moon was made before the cows."

A COMPOSITOR, setting up a report of a horse race, said the "fool-sellers were busy," instead of the "pool-sellers." But it did not alter the sense of the paragraph much.

IN the window of a shop, in the obscure part of London is this announcement. "Goods removed, messages taken, carpets beaten, and poetry composed on any subject."

AN old edition of Morse's geography says: "Albany has four hundred dwelling houses and twenty-four hundred inhabitants, all standing with their gable ends to the street."

A MEMPHIS prisoner, who hated to see two lawyers disgrace the court-room by fighting, walked out, and was unfortunate enough to get lost. He has not been heard of since.

WE believe in manly sports. Can anything be more imposing than to see 500 or 1,000 athletes sitting on hard benches in the broiling sun watching a game of base ball between two hired nines?

RECENTLY on Canal street, a member of —— church inadvertently stepped on a banana skin, and as he skated off to the gutter he knocked great chunks out of the third commandment.—*N. O. Picayune.*

A NORWICH man calls himself on his card a "temperance boot maker." The need of temperance boots is apparent, for though they're not generally drunk, it's a notorious fact that they're often very tight.

EXTREMELY KIND.

TOM (who has taken his cousin fishing for the first time)—"Now, SAM, just put your finger in and loosen that third hook."

"THE VIBRATOR."
1,000 SOLD LAST SEASON
WITHOUT ONE FAILURE OR REJECTION.

This is the famous Threshing machine that has "swept the field" and created such a revolution in the trade, by its MATCHLESS GRAIN-SAVING AND TIME-SAVING principles.

THE ENORMOUS WASTAGE of grain, so *inevitable with other styles* of Threshers, can be SAVED by this Improved Machine, *sufficient, on every job, to more than pay all expenses* of threshing.

FLAX, TIMOTHY, MILLET, HUNGARIAN and like seeds, are threshed, separated, cleaned and saved, as easily and perfectly as Wheat, Oats, Rye or Barley.

AN EXTRA PRICE is usually paid for grain and seeds cleaned by this machine, for extra cleanliness.

IN THE WET GRAIN of 1875 these were substantially the ONLY MACHINES that could run with profit or economy, doing fast, thorough and perfect work, *when others utterly failed.*

All GRAIN, TIME and MONEY wasting complications, such as "Endless Aprons," "Raddles," "Beaters," "Pickers," etc., are *entirely dispensed with;* less than one-half the usual Gears, Belts, Boxes and Journals; easier managed; more durable; light running; no costly repairs; no dust; no "litterings" to clean up; not troubled by adverse winds, rain or storms.

FARMERS and GRAIN RAISERS who are *posted* in the large saving made by it, will not employ inferior and wasteful machines, but will *insist* on this improved Thresher doing their work.

FOUR SIZES made for 6, 8, 10 and 12 Horse Powers. Also a specialty of SEPARATORS designed and made EXPRESSLY FOR STEAM POWER.

TWO STYLES OF HORSE POWERS, viz.: our improved "Triple Gear," and our "Spur Speed," (Woodbury Style), both "Mounted" on *four* wheels.

IF INTERESTED in Threshing or Grain Raising, apply to our nearest Dealer, or write to us for Illustrated Circular (sent free) giving full particulars of Sizes, Styles, Prices, Terms, etc.

(CIRCULAR.
Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists, to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

EXCELSIOR

The Poultry Yard.

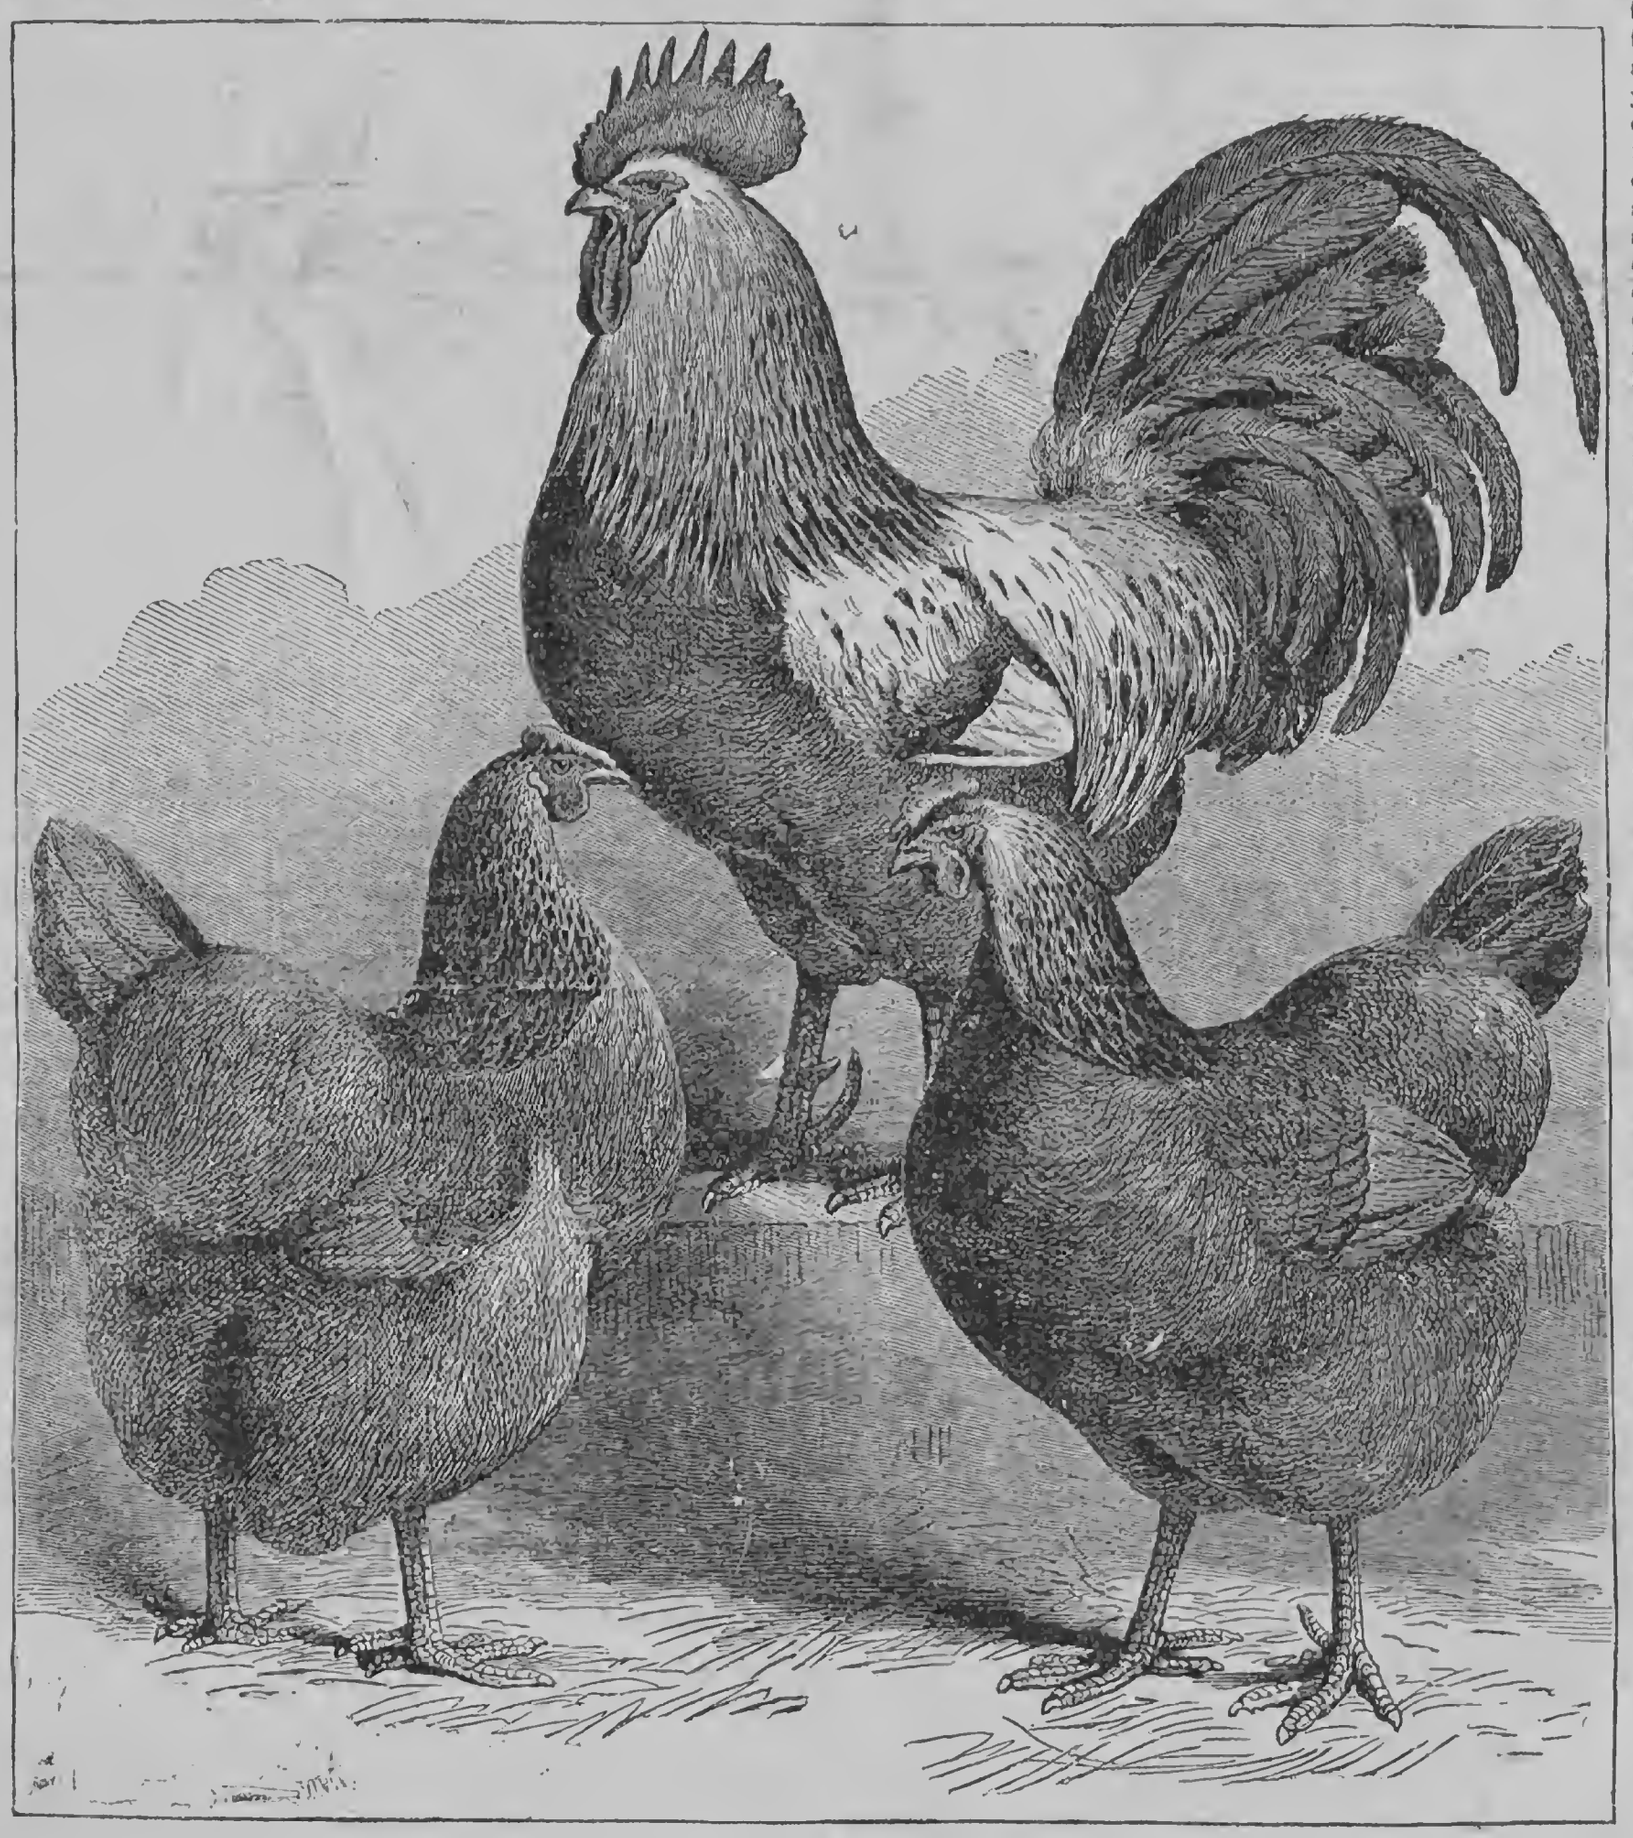
THE DORKING FOWL.

THE Dorking fowl is one of those breeds which do not well bear close confinement, but delight in rambling over a large yard or farm. Hence it is not so generally a favorite with those who have limited grounds as the heavier Asiatics. This breed, it is claimed, is descended from fowls brought to Great Britain by the Romans in the time of CÆSAR; but of the truth of this there is certainly room for doubt, and the same may be said of the reputed origin of some of the different strains or varieties of the Dorking which of late have become so popular both in Europe and America. One of the handsomest and best of these is what is called the Silver Gray Dorking, a trio of which are shown in the accompanying spirited illustration. Some of our American poultry breeders claim that this fowl is a composite of the old White Dorking and the Light Brahma, or other closely-related Asiatic breed; but whatever its origin, it is certainly a handsome and valuable fowl, ranking high among the best for both flesh and eggs.

TEGETMEIER, the well-known English authority on poultry matters, says of the Silver Grays: The distinguishing colors of the cock are a perfectly black breast, tail and larger tail coverts; the head, neck, hackle, back, saddle, and wing bow, a clear, silvery white. Across the wings there should be a well-marked black bar, contrasting in a very striking and beautiful manner with the white outer web of the quill feathers and the silvery-white hackle and saddle.

In the hens of this beautiful variety the breast is salmon-red, passing into gray toward the thighs. The neck is silvery-white, striped with black; the back, silvery-gray, with the white of the shafts of the feathers distinctly marked. The wings should also be of a silvery or slaty gray and as free as possible from any tendency to redness. The tail should be dark-gray, the inside being very nearly black.

This fowl is decidedly one of the most useful of all for table purposes, as not only is its flesh extremely delicate, but it is produced early and in great abundance. The proportion of meat to bone is probably greater than in any other breed. As layers the Dorkings do not excel, and a wide range, as we have already said, is necessary to keep them in good health: but when furnished all the requisites, there are probably few breeds which are more valuable.



A TRIO OF SILVER GRAY DORKING FOWLS.

SOMETHING ABOUT FOWLS.

I PROPOSE to write a few articles in regard to keeping fowls for the benefit of those of your readers who have not been through a regular course of experience and to help those who are not "fanciers," but who may, under various conditions, wish to keep fowls and are not acquainted with the merits of different breeds to meet their individual circumstances.

A great many persons, not being well informed, make mistakes which bring them troubles they little dreamed of at the time, but which leave a lasting impression on their memories, and perhaps bring some of their old neighbors' failures into bold relief before them. This subject has been thoroughly investigated during the last few years, and it is now well known that fowls have not only different habits of laying and setting, but of disposition and health. Some are impatient of confinement and will not thrive if restricted in their habits, except by great care of feeding. Some are subject to diseases of one kind and others of another; therefore, after a man has decided what breed of fowls is the best for him to keep, he can make himself acquainted with their different characteristics, and as all perfections cannot be found combined in one breed, let him be content to keep such fowls as are best adapted to his circumstances. For instance, a person having a small garden surrounded by those of neighbors would commit a great folly were he to procure Game fowls Dorkings or Hamburgs, to raid all over his neighbors' grounds, not but what they can be kept, and in health, in properly-constructed quarters, by good care and feeding; but as they are restless and lively, requiring so much extra care, it is best to discard them and keep such fowls as Brahmas, Cochins, or Plymouth Rocks These can be kept in a small place, not requiring a high perch or roost. A fence two to three feet high will keep them in. They do not seem to require that change of food that fowls of greater vivacity do. They exert themselves but little to catch insects in summer, and in feeding on meat in winter they do do not possess a craving for it and will leave it sooner than other breeds; but still, if confined, they must have all the varieties of food to keep them in health. They will *thrive* upon it, commence laying in January and continue through the winter. They will also sit and hatch their own young, and are quite careful mothers, but, from their great weight, often kill a chick by stepping on it. They save many chicks, however, through their very quiet disposition, that other fowls would lose and destroy by their impulsive restlessness.

In laying qualities, the Brahmas have a little the best of Cochins, except Black Cochins, this latter bird being a little better layer than other Asiatics, which is probably due to a cross that originally brought the black color and also improved their laying qualities. The Light Brahma is also considered by most breeders a better layer than the Dark; but as the difference is very slight, one may please his own fancy. I shall not at this time describe the standard of feathering of different breeds, but will leave that for future papers. I shall merely say of feathering, that in the Black Cochin it is harder to maintain that peculiar Cochin form and fluff feathering that other Cochins possess, they not generally feathering as well on the legs. All of the above fowls are a beautiful class, and, being so very gentle and docile, they absorb one's interest in them.

Plymouth Rocks are a comparatively new breed, combining the hardiness of the Asiatics (which are the hardiest of all fowls) with the better laying qualities of Dominiques.

H. HALES.

A DUTIFUL SON.

WE are all familiar with the old joke of a

cock laying and sitting, but I actually have a case of a cockerel setting. I had an early brood of Gray Dorkings hatched by a Dorking hen. When big enough, the old hen gave them the slip in the usual way; but one son did not like being thrown on the world in that way, so he kept track of his mother. In a short time she laid again, in a stolen nest under an evergreen tree, where she commenced to sit again the second time, and the cockerel sat on the nest with her the most of the day, occasionally running off to get a feed and back again, remaining all night. My wife discovered the nest by his bright, large comb sticking out from his mother's feathers. In due time the eggs hatched and the hen strutted around with her new family and their big half-brother, who was very careful not to tread on the chicks. He certainly did his share when his mother called the chicks to partake of anything nice, but I am quite unable to say in what capacity he regards himself, whether as brother, step-brother, or father to the chicks.

Ridgewood, N. J. H. HALES.

SELECTING YOUNG POULTRY.

ONE of the most important things for breeders of first-class Poultry, is to pick out their young birds that are in any way defective; and to keep only the most promising ones. It is trying work for Amateurs to kill off any of their young pets, but if they cannot be otherwise disposed of, it must be done.

This is work that few Amateurs will do thoroughly until experience teaches them the great necessity of such a duty. There is always a large percentage of young stock of all breeds that do not come up to the desired standard; although in the hands of experienced breeders it is less than it would be otherwise and when a particular strain is worked for, many have to make way for their more favored companions. But let not the young breeder be discouraged; the killing off of a few of the defective birds makes more room for those that are left and gives them a better chance in the battle of life. It is well to be sure to make the selection yourself. If done by proxy, perhaps the wrong heads may come off. H. H.

The Horseman.

THE HORSES OF NORMANDY.

THE Pall Mall Gazette in correcting some errors in regard to the history of this noted breed says:

In alluding to the results that have followed the importation of late years into the United States of French horses for stock purposes, an American journal observes that the imported Normandy sires are a cross between the Arab and the primitive type of the Norman horse, possessing the stoutness, elegance and docility of the former, and the commanding size and strength of the latter. This description of the lineage of the Norman horse of the present day is scarcely in accordance with the accepted history of the production in France of this now well-known breed of horses. For though the Arab horse has been undoubtedly the regenerator of the indigenous breeds of the South of France, it does not appear that he has had much, if anything to do with the amelioration of the horse of Normandy. The improvement of the Norman horse must in common fairness be attributed, not to the blood of the desert, but rather to that of the English "turf." Of this blood, powerful agent as it is, it cannot be said that if it does no good it does no harm, and it thus happens that its injudicious employment of late years, owing to an exaggerated predilection in France for the English thoroughbred horse as a sire, is especially instructive to those who occupy themselves with horses, as affording an example that in horse-breeding, as in other matters, it is possible to have too much of a good thing. In the old time when armoured knights tilted at each other on horses equally clad in mail, the type of the Norman horse was to be found in two breeds, the Merlerault and the Cotentin. Both of these breeds enjoyed a certain reputation, and as roads and wheeled carriages followed in the track of civilization, one came to be preferred for draught and the other for the saddle. These were the Norman breeds which French breeders more than a century ago thought they might improve by the importation of stock from England. At that time English horses were fast rising in renown; but the first batch of them which arrived in Normandy consisted of large, heavy animals, and very coarsely bred to boot. They were thus powerless to stamp the indigenous breeds with hereditary mark of either a lasting or favorable character. The next importation from across the water was of a very different stamp. It consisted of twenty-four half-bred sires, and so satisfactory was the result of this experiment that the names of several of them affixed to their descendants were household words in the mouths of French breeders for many years afterwards. This was the first decisive step taken in the amelioration of the Norman horse, and these twenty-four sires brought over from England by the Master of the Horse of Louis XVI. may be considered as undoubted ancestors of the race then and ever since by the French the Anglo Norman breed of horses.

Unfortunately, much of the good that had resulted from the introduction into Normandy of these half-bred sires was undone by the abolishment of the Government breeding studs in 1790. And, as during the First Empire the English horse-market was closed to France, the breed commenced rapidly to degenerate. In 1830, the year from which it may be said that the blood of the English thoroughbred horse commenced to be mixed with that of the Norman horse, it was perhaps as sorry an animal as could well be seen. He had a thick, ugly and heavy crest, sunken withers and bad short shoulders. His back was hollow, and he was never well ribbed-up. His hind quarters were of all shapes, sometimes straight, sometimes rising aloft *en pupitre*. The hocks, frequently blemished, stood out from under him, making the line of the hind legs that of a sickle. A freak of fashion of former days had made a Roman nose an equine perfection, and so the Norman horse of 1830 rejoiced in a Roman nose. What with this curved line in front, and the sickle-shaped line of the hind legs behind, the animal was said to have looked as if placed in a parenthesis. Added to all these exterior defects he had a bad constitution. He was a soft unthrifty horse, and subject to all sorts of hereditary diseases, which he only threw off with difficulty. In the course of twenty-five years this ungainly brute, still the horse of Normandy, is pronounced to have become a good animal, and as handsome as good. Smaller, but altogether of better quality than before, he was useful either as a hack or a hunter. The larger bred ones did as well as carriage horses. A rich bright bay was the predominant color of the Norman horse of the Second Empire, and a few were gray or sorrel. This remarkable improvement of the old Norman breeds is wholly attributable, according to French authorities, to the blood of the thoroughbred horse of England rationally and judiciously used. But according

to these same authorities the Norman horse of more recent days is the commencement of an exaggeration of the system which had such good results. The cross too often repeated has undone much of what was done in former years, and, through the persistent use of the imported thoroughbred horse as a sire, instead of judicious resort to best shaped of home-bred animals, the Norman horse has become too high-bred and weedy, and therefore not so useful for the every-day wants of those who breed him. The present result of the importation of these high-bred Anglo-Normans into the United States is reported to be satisfactory, and this result, bearing in mind their lineage, might have been presumed to follow their introduction into that country. The produce where it loses in elegance and grace will probably gain in compactness and soundness and freedom from hereditary infirmities.

HORSE SHOE AND SHOEING.

THE following excellent advice on the above subject lately appeared in Forest and Stream.

On an average horses require shoeing once a month. The length of time a shoe will wear depends much on the kind of service a horse is doing, and on the kind of road he is daily traveling. A team horse in heavy draught does not wear out as many shoes as one used in a hack; quick motion grinds shoes down more rapidly than slow use. Some pavement is harder on shoes than an ordinary road, while the friction of a gravelly road wears them away rapidly Wooden pavement is but a little saving to the wear and tear of shoes, for the grit and dust which become impacted in the interstices of the wooden block grind away shoes like the friction of an emory wheel.

The hind shoes wear out first, and there is more strain and friction on them than on the fore-shoes. It is impossible and improper for a horse to wear shoes more than six weeks, for the growth of the foot shortens the shoe, as well as changes the shape otherwise. The neglect will cause the shoe to encroach upon the soft textures of the foot and produce lameness.

The greatest amount of custom to the blacksmith comes from the teamsters, expressmen and livery men. Omnibus and railroad companies have their own forges and do their own shoeing.

The process of making a horseshoe is familiar to every school boy, who has often lingered at the smithy door and listened to the wheezing of the asthmatic bellows and when the foot is paired, wondered that it did not bleed. Again, he has seen the strong-armed workman pluck the piece of glowing metal from the bright fire, and with the hammer give it repeated blows, and give it shape by curling it over the anvil point. Heating again and again, the iron he pounds maliciously, causing the hissing sparks to fly in all directions, until at length a shoe is formed complete.

This tedious process is superseded by machinery, and now like a doughnut a shoe is cut out of a sheet of steel, shaped, creased, and punched precisely as if done by hand. More shoes can be made by machinery in one day than a blacksmith can make by a forge in a week, and, equally as good too, in all respects.

The matter of horse shoeing is of great interest to owners of horse flesh, for every one has an idea how the shoe should be shaped and fitted to enable the beast to travel to his notion. If he overreaches, interferes, or stumbles, the blacksmith is held responsible. It is true a skillful mechanic can do much to remedy these evils. There are but a few practical mechanics who have sufficiently studied the foot of the horse. It is not enough to know the anatomy of the foot, and where to insert a nail not to cause pain, but the foot should be studied in the state of nature before the mechanism of man has by artificial appliances distorted it. The shape of the hoof of the wild horse, or of one who has never been shod, should be taken as a model. The foot is then properly balanced, neither too long nor too broad, but it has adjusted itself to nature, and the muscles and tendons are not strained by travel. Confinement and unskillful shoeing changes the anatomical relations of the foot, and the best judgement of the mechanic is often taxed to correct the growing deformity—from unskillful shoeing. When a reasoning, skillful mechanic is found the horse is safe in his hands, for he only preserves the normal shape of the hoof, and adjusts the shoe to protect it.

The frog in the hoof of the horse is placed there for a particular purpose, and should not be cut by the shoer. If this is allowed contraction and lameness will follow. The shape and weight of the shoe should be accommodated to the purposes for which they are designed. The track horse requires a shoe lighter and without corks, while the draught horse must have a heavy, broad shoe with corks to enable him to obtain foothold and travel with the least possible strain. The sporting horse should be shod lightly, with a swell at the heel and toe; the best nails should be selected, and care used in clinching, for the casting of the shoe during the chase is of great inconvenience, and might throw the horse and jeopardize the limbs and life of the rider.

Dairy Husbandry.

THE DAIRY IN WISCONSIN.

THE Secretary of the Wisconsin State Dairymen's Association, Mr. D. W. CURTIS of Fort Atkinson, sends us the fourth annual report of the Association for the year last past. Wisconsin is among the States where dairy farming has but recently been introduced, but under the factory system this interest has been rapidly developed, and now occupies a very prominent place in the list of the agricultural industries of the State.

We have personal knowledge of the soil and climate of Wisconsin, having at various times made extensive journeying over the State, and we are well satisfied that its soil and climate are adapted to dairying. Hence it is no surprise to us that the business has been pushed forward so rapidly within the last few years.

THE PRESENT CHEESE PRODUCT OF WISCONSIN.

According to the statement of President HIRAM SMITH in his opening address at the late Dairymen's Convention at Sheboygan Falls. Wisconsin made a cheese product in 1871 of 13,000,000 lbs., and during 1875 the increase was estimated to have been a little over 20 per cent., making a total production for the year last past of 15,000,000 lbs. The increase in Sheboygan County in 1875 was not less than 33 per cent., being a total production for that county of 1,000,000 lbs.

In referring to the progress of dairying in Wisconsin, Mr. SMITH draws a comparison between his own State and that of Ohio. He says that in 1870 the production of cheese in Ohio, according to the twenty-fourth annual report of the Ohio Dairymen's Association, was 22,200,000 lbs., and for Ashtabula County — the banner county for cheese in that State — it was 3,000,000 lbs. So that, with the present rate of increase, it is in the near future when Wisconsin will exceed Ohio in the extent of her dairy products.

DAIRY FARMING — PAST AND PRESENT.

Mr. SMITH refers to the dairying in Northern New York in 1835. He says that about this time there began to be a steady increase in the production and demand for cheese. "It was the custom for each farmer to make his own cheese, or rather, his wife did the making, and a woman who could not make the cheese, get it to press and all washed up in time to get dinner by 12 o'clock for the men was called a pretty "poor stick," and a man having such a wife received the pity of the whole neighborhood. If there is anything that shrinks a man's manhood, it is neighborhood pity, especially pity for any supposed deficiency in his wife. The cheese were held all summer and sold in the fall; the June and July cheese usually bringing a penny per pound more than those of September and October make. There was a disposition to pay for an article in proportion to the time expended upon it. The trade is now reversed—that is to say, cheese twenty days old will bring more money than cheese twenty weeks old. And although cheese then sold for the low price of 3½ to 6 cents per pound, yet by close economy and nutiring industry dairymen prospered, and they continue to prosper, if prosper at all, by the same hard terms."

WHY DAIRY FARMING PAYS BEST.

Mr. SMITH has a word to say concerning the prevailing opinion that dairy farming pays better than other branches of agriculture. It is mainly for the reason, he thinks, because it furnishes continuous employment. He says that if wages were paid by the hour, it would be found that dairymen work as cheap as any other class of laborers. While the receipts of a dairy farm are usually more than for grain raising, yet it is no more than just that it should be so, when we consider the increased cost of stocking such a farm and the additional hours of labor; and herein consist the chief advantages of dairy farming, that it furnishes steady employment and its receipts can be relied upon with a good degree of certainty.

"A dairy farmer is more likely to live within his means than a grain farmer, whose receipts may vary from $3,000 to almost nothing; for, after all our figuring, it is the net profits saved that make or unmake prosperity."

Besides the annual reports of the Secretary and Treasurer, the pamphlet before us contains addresses on "The Value of Milk," by H. L. DOUSMAN; "Care and Feed of Cows," by W. C. WHITE; "Best Market for Cheese," by C. H. WILDER; "The Patron and his True Interest Considered," by W. D. HOARD: "Dairy Fairs and their Results," by H. C. DRAKE; "Dairying in the Northwest," by G. E. MORROW; Statistics of the Dairy Fair of 1875, with the discussions on a variety of topics brought before the Convention and other matters of interest to dairymen. The Report is very nicely printed and is to be commended for the good taste with which it is got up, as well as for the valuable information scattered throughout its pages.

MANUFACTURE OF WHEY BUTTER—THE CHEDDAR SYSTEM.

THE whey being drawn from the cheese while sweet, is run off into tanks of tin or lead, which are about 2½ feet high, the bottom resting on the floor. At the Brailford Factory, where cheddar cheese is made, the tanks are built of blue brick, cemented. Here the whey lies until next morning — in all about 22 hours — when it is skimmed with an ordinary cheddar skimmer, either perforated or not. The cream is then poured into tin cans for the purpose of scalding. These cans, holding about 10 gallons each, are placed in a boiling vat, partly full of water, which is run up to 212° Fahrenheit by steam. The steam is turned on till it gives the water no more than a gentle, simmering motion. At this stage a handful and a half of salt is added to about every five gallons of cream, and the whole is stirred often with a small paddle. When the cream has ceased to rise and is fine and free from the thickness which before characterized it, the time which it occupies being, as a rule, from 20 to 30 minutes, the scalding is completed. It is now removed and placed in tin cans, holding about 10 gallons each, with small, brass faucets at the bottom. The cans are only made about half full of cream, and are then filled by adding to the cream clean, sweet, cold spring water. It is then left at rest until the next day, or about 24 hours, when the whey and water will have settled to the bottom and the cream, separated from all its impurities, will be on top. The water is now drawn out through the faucet until the cream is reached, when it may be turned into the cream jar, being stirred from time to time until ready for churning. The churning and working of the butter are performed in the ordinary manner, as for cream raised from milk. Whey butter made under this process is not much inferior to butter from milk, and has sold in the English markets for only 2 to 3 cents per pound less than good cream butter. During last season the whey butter made at the Brailsford Factory (Derbyshire) sold at from 42 to 43 cents per pound, while first-class cream butter commanded in the same markets from 44 to 46 cents. This method of making whey butter differs from that usually employed in America, and will be of interest to our dairymen.

SHEEP AND COWS PASTURED TOGETHER

SINCE the decline in the price of cheese, some of our dairy farmers are advocating the introduction of sheep upon their farms in connection with the dairy, and it is suggested that sheep and cows may be kept together upon the same pasture with advantage. The reasons given are that grasses left or refused by cows will be eaten by the sheep, and thus there will be less waste on account of tufts and patches of grass left by the cows to mature and to become hard and woody. And again, the droppings of the sheep over the surface of fields render the soil more fertile and increase the productiveness of pasturage. Sheep also, it is said, serve a good purpose in keeping horned cattle healthy.

Some of the reasons given may be all true enough, and yet sheep in any considerable number, it is believed, ought not to be pastured with milch cows. Sheep, as is well known, pick out the finest and best grasses, leaving those that are coarse and less nutritious for the other stock. Milch cows pastured with sheep, when the latter are in considerable number, it has been observed, yield less milk and milk of poorer quality than when the two classes of animals are pastured separately. The reason is obvious. If the best and more nutritious grasses be selected and eaten down close, leaving the poorer grasses for the cows, it is evident they cannot make such good returns as they would upon a more favorable diet.

The best pastures for milk are those which will make the most beef. Old pastures, as is well known, are much better for fattening than recently reseeded grounds. The old turf is filled with a greater rarity—with finer and more nutritious herbage, from which meat can be made—than the coarse and flashy feed of new pastures, and it is upon such pastures that the most and the best quality of milk is produced. Now, any class of animals like sheep, that "bite close" and select out the more nutritious of the grasses, must to a certain extent leave the balance of the food comparatively poor in quality. Sheep, it is true, will often eat plants that are left by cows, and if they would always or wholly feed upon the food left by the cows, doubtless there would be an important gain in pasturing the two varieties of animals together. But in practice we find the sheep preferring the best herbage, and as they bite closer than cows, they can always keep the advantage when pastured together.

The idea of keeping sheep on dairy farms is not a bad one at this time by any means, but we should prefer that they be pastured by themselves or with young cattle, and not with the herd of milch cows. The character of pasturage for the production of milk of superior quality is imperfectly understood by many dairymen, and there can scarcely be a doubt but that the delivery of milk at factories from different farms in many instances operates unequally, since the poor milk is credited alike with the richer.

FEEDING CORN MEAL TO COWS.

MR. MILLER who has of late brought himself into very conspicuous notice by claiming that cows will do well in winter by being fed entirely on corn meal, is getting some pretty severe criticism from farmers and scientists. Mr. T. B. MINER, one of our occasional correspondents has a word to say on the subject in the Weekly World from which we copy the following:

The feeding of Indian meal to cows has been practised in the United States since the landing of the Pilgrims in 1620. Mr. Miller's experiment in feeding meal only shows what all farmers knew before, that cows will exist on corn meal alone for a while, but to claim that he has made a discovery that will prove to be a great benefit to stock-breeders and farmers generally is in my opinion absurd. The natural food of cows is grass and hay, and to deprive them of such food, even if they could be made to live on something else that is cheaper, carries with the act a degree of inhumanity that is repulsive to farmers.

The report of the committee of the Western New York Dairymen's Association on Mr. Miller's system of feeding does not "set at rest the question of its practicability," beyond the simple fact cows will exist some two months on corn meal alone. Mr. Miller claims that three quarts of Indian meal is equal in value to twenty pounds of good hay to feed to cows. Nobody will deny to him the right to feed this meal instead of hay if he pleases to do so, but farmers are not going to be foolish enough to attempt to winter cows on meal alone. Cows actually require in the winter twenty pounds of hay per day and about three quarts of meal of some kind, or roots of equal nutriment to thrive and be in good condition, and a score of "reports" of committees and "explanatory letters" from "professors" cannot and will not change that fact.

Mr. Miller thinks that he has made a "new discovery" in this meal feeding matter. Some thirty years ago a man by the name of Graham also made a "new discovery," which was that mankind would be in better health, and live longer, by eating no animal food. Then the "Grahamites" appeared in large numbers; but where are they to-day? Gone to that bourne whence no traveler returns, Graham being the first victim. Every few years we see men riding some foolish hobby, which shortly "subsides" to make room for something else.

Mr. Miller bases his arguments on the alleged great saving in wintering stock to feed corn meal alone. Now, as he undoubtedly is acute as to expenses, suppose that he tries my "discovery" on himself, which is that a man can actually be kept in a healthy condition and with sufficient nutriment to sustain life on corn meal made into a pudding daily, and not to cost over $5 a year! I will agree to supply him with enough of this meal to sustain him in health one year for that sum. He would require a gallon or two of molasses to give his pudding a nice flavor, but nothing else as food would be needed. Here, Mr. Miller, is a chance for you to save over $100 a year in your own food, and probably $500 on that of your family, if you adopt my "discovery." Will you do it? Not at all, because you would say that such a diet is inhuman and cruel, while you can see your poor cows deprived of their hay, and suffer the loss of their cuds to save a few cents daily!

Mr. Miller showed that cows will live and not appear to be injured by feeding each three pounds of meal per day for about two months. But that short time is no test of the merits of the system. They would also live and be in equally good condition if fed on bran or roots for that short time. No, Mr. Miller your "great discovery" is not going to revolutionize the system of feeding cows in winter at all. Farmers know what the virtues of corn meal are, and they will continue to feed it or other meal moderately to their cows in connection with hay, as they have done for centuries past.

POWDER FOR HARDENING BUTTER IN HOT WEATHER.

AN English butter maker of large experience, who is now on a visit to this country for the purpose of looking over our cheese and butter dairies, gives us the following information concerning a method in practice among the best butter-makers of England for hardening or rendering butter firm and solid during hot weather. Carbonate of soda and alum are used for the purpose, made into a powder. For 20 lbs. of butter, one teaspoonful of carbonate of soda and one teaspoonful of powdered alum are mingled together at the time of churning and put into the cream. The effect of this powder is to make the butter come firm and solid and to give it a clean, sweet flavor. It does not enter into the butter, but its action is upon the cream, and it passes off with the buttermilk. The ingredients of the powder should not be mingled together until required to be used, or at the time the cream is in the churn ready for churning.

The Centennial.

THE DAIRY AT THE CENTENNIAL.

RUMORS expressive of various shades of discontent have unhappily accumulated of late, concerning the model (?) Cheese and Butter Building in the exhibition grounds.

I have been willing to pass unheeded *ex cathedra* statements by those who may have considered themselves put upon, knowing full well that the moral epidermis of specialists is more delicate than a hot-house sensitive plant. Latterly, however, nebulous dissatisfaction has crystalized into positive arraignment and, as a correspondent with an eye single to the interests of a leading class journal which has carefully and, I may add, successfully fostered our dairy industry, I have conscientiously gone into the merits of the subject and propose to give herewith the result of my investigations.

Although the United States is a large producer of dairy products, it will be a matter of surprise to those who have not looked into the subject to learn that, as a people, we eat but very little cheese, comparatively speaking. The excellence of the product has had no effect in causing its general use. Dairymen were pecuniarily cognizant of this and hailed the Centennial as an opportunity for modifying the public taste. It is evident, then, to popularize cheese, it was of the first importance to secure a vantage ground for the display that would attract, not especially the agricultural class, who understood its importance, but the masses who would come to see from motives of curiosity and leave with ideas and prejudices favorable to a more general consumption.

Such a display would have been appropriate in Agricultural Hall, but practical men urged the difficulty of keeping in good order, in such place, products that require special treatment in regard to equable temperature, and a committee of gentlemen identified with the dairy interest met in council and decided to erect a building on the grounds that should meet all requirements and in addition be a model butter and cheese building, where all might see the *modus operandi*.

The building is erected. It stands in a kind of basin, with high land to one side, where it should have been placed. Forming three sides of a square, the plan designed two sides for wings in which are to be placed the cheese displays, while the third side is the main building in which are rooms for a butter exhibit and space for the cheese and butter apparatus; a part of the second story is devoted to offices, sleeping apartments and a restaurant. For the money expended I think a better structure should have been made. There is also a cellar, which Mr. Arnold says "proved to be inadequate to the task of cooling properly," which is mild and humane language. "Proved to be inadequate to the task," is a verdict that would fit in other quarters besides the cellar. The room that was to be an exemplar in cheese making fails ludicrously. It contains a few cheese vats, a press, and a boiler and engine adjacent thereto. It is about as strong a suggestion of the mode of making cheese as the bore of a gun is of the velocity of a bullet. It is a model of nothing, if not of how not to do it.

The same may be said of the neighboring apartment, devoted at present to promiscuous churns, a small refrigerator of butter and a few milk pans. The corner room is intended for a butter exhibit. There is no butter to be seen at present, because the room was so hot the butter had to be removed, or it would have run away of its own accord. The Commission failed to keep up the supply of ice, and the temperature rapidly grew as warm as the indignation of the exhibitors.

There has been displayed in the Canadian wing of the building 303 cheese; in the American a larger quantity, including 7 from Ohio, 19 from New York, and some 200 from Wisconsin. The heat, we know, has been excessive, and, as far as I can see, there are in these wings positively no artificial means to control the temperature with a single exception, and the Wisconsin lot has fermented, or puffed, deteriorated in quality, and, according to the statement of Mr. Reall, been withdrawn under protest, sold at a loss, and the owner, Mr. Hazen, about to assess damages. The Canadian cheese has fared better. The inquisitive visitor at present cries aloud, but in vain: "Where is your butter and cheese?" The restaurant is the only flourishing product remaining. The prices are reasonable, the service as bad as it well could be, and the apartments reserved for the preparation of food positively unclean.

It has been asserted that the ventilation, and other means for controling temperature, is all wrong and very bad. I think it is a mistake to say so. The ventilation, in my judgment, is entirely too good. The air from all out of doors has unrestricted access to all indoors, and the only party who does not hold a sinecure is the orb of light, otherwise the sun. Latterly, Prof. Wilkinson has attempted to modify this state of things by applying his patent ventilating duct. It is a failure; but granting his principle to be right, it is hardly to be expected that one can modify the whole circumambient ether, as it were, with 160 feet of a hole in the ground.

It was, I am informed, distinctly understood at the meeting of the American Dairymens' Association, that a building should be furnished capable of controlling the temperature, and holding it at from 60 to 70°, and, on this assurance, subscriptions were taken, otherwise exhibitors would have made a display in Agricultural Hall and avoided the extra expense. In view of these facts, it is pertinent to inquire the reason of this state of affairs, and who, if any, are responsible for it.

Previous to the opening of the Exhibition there assembled in Philadelphia committees of dairymen, who at once were divided into sub-committees after the manner of the polyp, and imitating the peculiarities of this little creature, each particle severed from the main trunk, at once assumed the functions of an entity, and proceeded to business with an entire disregard to harmonious action that was more curious, than entertaining. It would be a work of supergation to detail the perplexities and bad blood engendered by actions that would have created no surprise in amateurs fresh from a so-called Business College.

The Executive Committee of the A. D. A. was composed of Messrs. Pope, Scoville, Lewis, Hawley, Shull, Blanding and Reall. There may have been more, there is certainly one less, as Mr. Reall has resigned, and expressed his reasons for doing so in vigorous Anglo-Saxon. On these gentlemen developed the important duty of selecting a suitable plan for the dairy building. They are all experts in dairy matters one of them a sapient authority on Holy Writ. Such qualifications should have produced a structure that in point of merit would have been as it were gilding refined gold. They may for aught I know think the present storeroom answers this description.

The building as it stands is the product of Mr. Blanding's brain, with modifications. Professor Wilkinson also submitted plans that were carefully returned. The desideratum was, as before stated ventilation, perhaps some plans are in a fair way to receive that sweet boon. Mr. Pope paid his respects to the Centennial Commission and presented Blanding's plan estimating the cost of construction at $10,000. As near as I can ascertain Canada had subscribed $2,000, private contributions amounted to several thousand, and the N. Y. Legislature had appropriated $8,000 for the Centennial display of State cheese under the direction of the N. Y. State Dairymen's Association; Hon. X. A. Willard Prest., J. Shull, Sec. This fact seems to have an important bearing. About this time the RURAL threw some light on various transactions in dairy matters and was soundly scolded for trying to spoil a nice show from motives the reverse of exalted. I have seen the nice show and hope your correspondent's motives at least have become aerated and consequently more exalted.

Affairs progressed, and it became necessary to have some money. There were some nine or ten thousand in New York that only required, to secure possession, the call for a meeting of the Executive Committe of the N. Y. State Dairymen's Association by its President, Mr. Willard, and a vote to have the Treasurer disburse it. No such meeting was ever called, yet the money was secured all the same, which is strong proof of the business capacity of the Committee. It appears that Mr. Secretary Shull called a meeting—indeed several meetings were held—when, finally, Messrs. Shull, Scoville, Lewis, Hawley and Blanding met and conferred on Mr. Shull the power to draw the State appropriation and dispose of it in the interest of the New York display. The Executive Committee of the Association consists of ten members, including the President and Treasurer. These gentlemen were never at any of these meetings officially, and in fact at no time was there a quorum. The consent or approval of the Treasurer of the Association has *never* been received by these gentlemen as an indorsement of their acts, and it is now clearly a legal question if the parties concerned are not severally responsible for the funds thus appropriated.

The reason of this anxiety to have Mr. Shull handle the money I cannot explain, unless it was because Shull, Lewis and Hawley of the Executive Committee were also the Auditing Committee, when it is very plain that there would be less friction, a better understanding, and business expedited in fact, when the money could be received and paid out by one man in a dual function.

In speaking of such clever management, that reflects credit on the astuteness of all concerned, I can only wonder that the building is so poor—that is, that some consider it so feeble, you know. I feel constrained to say a word in praise of Mr. Pope, also, who merely receives a pittance at present for his labors as Superintendent. As he truly observes, "After all, money is not everything!" He neglected his large interests in Ohio, which, in the present condition of the cheese market, was true abnegation, and while he must have been losing money daily in his usual avocation, he accepted his present trust without remuneration. Such sacrifice recalls the Spartan who would rather let the wolf gnaw, etc., than allude to the delicate circumstances of its acquisition.

I know a parallel on the Committee, viz., Mr. Blanding, who waived his fees as architect and became a simple contractor, agreeing to put up the structure after his plans, at his own expense, and taking his chances for being reimbursed out of the fund to be appropriated. Had it not been for these gentlemen, where would our building have been? I don't know what the structure has cost as it stands, but Mr. Blanding, in a letter to Mr. Pope reporting progress, says he figures the cost at something over $9,000, but it would be well to strike the Commission for about $12,000. In Prof. Wilkinson's last plans estimates were $7,300.

Mr. Reall states that a model cheese factory in Illinois cost $5,000, and gentlemen who have seen this building have returned to New York expressing the opinion that $6,000 would be a large price to pay for a similar one. However, these gentlemen did not perhaps consider the difficulties to be overcome in fetching lumber to an out-of-the-way place like Philadelphia.

Credit is due to endeavor, although unsuccessful. The managers are earnest in their efforts to start the display forward, and I notice that B. B. Moon has a letter in Herkimer Co. Journal urging factory men to be patriots. I think, myself, that it would be entirely safe and patriotic to send along a few cheese about the latter part of September. Mr. Moon, I understand, is interested to the extent of 75c. per hundred on all the cheese he can divert to Philadelphia. I forgot to ask Mr. Pope if Mr. Blanding's charge of 75c. would be added, making it cost about twenty per cent to handle a patriotic cheese.

A very interesting query has been suggested by a friend here, which the committee might care to answer in an individual capacity. It is, how and from whence are the members of various committees to be paid necessary traveling expenses. The Auditing Committee can take care of themselves, of course, in this particular, as Mr. Lewis would say to those who have much shall be given, but would not the restaurant fund be well applied in this direction? YOUNG RURAL.

CENTENNIAL FIELD EXHIBITION,
SCHENCK'S STATION, Pa., July 20, 1876.

MR. JOHN COLEMAN arrived this morning at eight o'clock and went to work in earnest. The first machine set was the Doylestown Jr. and what with slipping of belts and several other disabilities, it made but a sorry show. It was a small Thresher and vibrated much with the steam power. Complaint was made of the power and a general investigation followed which resulted not only in the total rejection of the Dynamometer but the whole record and tests of threshers theretofore made. To begin anew on such a day was not an entirely delicious prospect; but our Brittanic friend came here to test these machines and intended evidently to do so, a plan was then arranged for the steam machines to be fed 2,000 lbs. and thread machines 1,000 lbs. each, time and weight of grain and waste to be taken and general results to be noted. Thereupon another start was made and continued with an energy worthy of a poorer cause. Then it was that Boss Geddes displayed his executive ability. For an hour or so he was as ubiquitous on that field as a borrowed horse and buggy could make him. The Wheeler and Mellick was ready and tested in a short time and was followed in quick succession by others with results shown in the following table:

NAME.	Power.	Weight of Unthreshed Grain, lbs.	Time, minutes and seconds.	Weight of Grain, lbs.	Weight of Waste, lbs.	Elevation of Horse-power, degrees.	Speed; No. revolutions of drum.
Wheeler, Mellick & Co....	2-Horse—Tread...	1,000	19	327¾	22	14¾	1,300
Minard Harder.....	2-Horse—Tread...	1,000	18:30	320	19	14	1,300
Ellis' "Champion".....	1-Horse—Tread...	1,000	34	310¾	7¾	15¼	600
Heebner & Sons.....	2-Horse—Tread...	1,000	15:15	305	30	13	1,200
G. Westinghouse & Co....	10-Horse—Steam ..	3,000	15:30	838¾	13	..	1,650
Geiser Manufacturing Co.	10-Horse—Steam ..	2,000	13	630¾	15¾	..	1,000
Hultzizer & Lazalere.....	2-Horse—Tread...	1,000	14:38	305	35¾	15	575
A. B. Farquhar.....	6-Horse—Steam ..	2,000	14:30	593	22¾	..	1,300
G. W. Westinghouse.....	2-Horse—Tread...	1,000	19:30	297¾	14¾	16	1,000

Those which had been tested the day before had to be again brought forward and no one of their owners seemed at all displeased with the arrangement, as everybody seemed to have the impression that the first trial was hardly trustworthy.

The table given above shows the order in which threshers were tried, but as the grain did not run uniform, it is scarcely to be relied on as an exact test. Here again the action of that sapient body the Centennial Commission was shown in all its fair (!) proportions. The test not being made obligatory on all to compete, but a small section of representative makers were present, which had the effect of detracting from the importance of the trial.

In the meantime the sun grew not warmer but hotter and hotter. About midday the engineer of one of the Aveling & Porter Locomotives, was sun struck and carried off the field. This incident set many people to thinking and those who considered themselves in danger of a similar contingency sought the shade of a neighboring orchard or left entirely. Not so our indefatigable juror from Yorkshire however, for he kept right on with his tests till six o'clock, when the last thresher had been tried.

The evening previous, one of Baker's Rotary Compressors and Blowers had been sent down for the purpose of testing the powers of the various portable steam engines. It weighed nearly 4,000 lbs. and it became a problem with Boss Geddes how to get it placed in position in the field. Happening to think of the Farm Locomotive, he suggested to Mr. Oastler the idea of using it for that purpose. Hardly sooner said than done—a crane, which came with the Locomotive, was affixed to the forward end and the steamer run out to the car on the siding. Chains being let down and fastened under the Blower, the throttle was opened a little and up came the Blower, swinging in the air. By one move of the hand the steam was connected with the drivers and off went Locomotive, Blower and all, as if a thing of life. Halting at the place designated, the Blower was dropped at the exact spot desired, and the weight of this part of the programme was off the car and off the mind of the theretofore perplexed superintendent at one and the same time.

SHORTHORN.

Farm Economy.

PURSLANE.

IT might be supposed that there are few farmers who are not pretty well acquainted with all that pertains to Purslane, the commonest and most persistent of weeds.

During a recent visit to a wealthy farmer on the south side of Long Island, we asked him and four others of his household and in his employ, separately, what the flower of Purslane was like? The first replied that he did not know it ever bore a flower; the others replied that they had never seen it. If, therefore, we are to judge farmers as a class by these Long Island specimens, the above supposition would prove a mistake. It is, however, the exception not the rule for any of us closely to observe weeds—especially low trailing ones—that exist in great abundance. The flowers, too, are small, of a greenish-yellow color that, opening not until the sun is well up, close before noon.

Purslane loves heat. The roots being annual, the plant does not appear until the first of June—earlier or later as the season is early or backward. It grows slowly at first, very rapidly about and after the latter part of June at which time it begins to bloom. Each plant bears daily let us say twenty flowers, and each flower matures from 100 to 150 seeds, by actual count, as black as powder and as fine as white sand, in a capsule called botanically a pyxis. In two or three days this pyxis, which is conically round and a quarter-of-an-inch in depth, splits in two and the seeds are scattered far and wide. All who have hoed or hand-pulled this weed must have noticed that when destroyed before the first of July, it is slow to reappear. When hoed after the first of July, millions of little plants (seedlings) appear in a few days after. The practice is to hoe or pull Purslane only when it has so spread over the ground as to interfere with useful plants. It is then left in heaps to wither in the sun, or, as often occurs, to root again; or it is thrown upon the manure heap there to shed its millions of seeds, or else, finally, it is fed to the pigs thence to reappear in the soil fertilized by this manure. Instead of this, if farmers or gardeners would make thorough work of pulling up Purslane just before the flowering period—except for the seeds that blow from neighboring premises, another weeding would prove unnecessary during the season; and two seasons would suffice for its entire eradication.

If each Purslane plant will average twenty flowers daily and each flower will bear at least 100 seeds, it is easy to see that our cultivated lands will be filled with young Purslanes at this season of the year just in the proportion that the first plants were permitted to bloom and go to seed.

Portulaca grandiflora and its varieties are the bright, beautiful flowers of the garden. *Portulaca oleracea* is the Purslane weed. The seed capsules are essentially alike and those of the former may be examined instead of the latter if more convenient to do so.

Floricultural.

"CINNAMON VINE."

UNDER this name, in RURAL, July 15, your correspondent describes exactly the *Dioscorea Batata*, or Chinese potato, except that he errs in saying the roots increase in size from year to year. A larger root usually forms each successive year, but it is grown anew—the old one decaying and furnishing food for the new ones. It was introduced in this country some twenty years ago as an edible, but having the habit of growing deep in the earth and wrong end up, as it would seem, takes the position of a reversed parsnip. It is very difficult to dig, and the culture of it for food was abandoned soon after it was commenced. I have had it for many years as an ornamental vine, which, for luxuriance of growth and beauty of foliage, I know of none better. One I planted in Northern Connecticut, many years ago, still lives. The cinnamon-like fragrance has often been noticed, and if we must have another than the botanical name, it may be called Cinnamon Vine with less impropriety than the common names usually given to plants.

L. A. R.

Since receiving the above communication, Mr. MAPLE has forwarded us a small plant, showing L. A. R. to be right in his conjecture. This yam has been so often referred to in the RURAL, (under Daily Rural Life) that though Mr. MAPLE's description at once suggested the *Dioscorea Batatas*, we yet deemed the plant too well known to have puzzled our Western friends, who have been at some pains to ascertain its name.

It has grown in the RURAL grounds for a number of years, and fully merits the praises of our several correspondents. Up to early June its growth is confined to single stems, with leaves a foot apart. By this time it will have attained a hight of at least ten feet, when, if the terminal bud be pinched out, slender laterals will freely appear, and its habit will strikingly resemble that of the Madeira Vine (*Boussingaultia basselloides*).

One day last June, we marked a shoot that had not yet thrown out laterals, and found its growth eight inches in twenty-four hours. June 12, a single stem had reached the hight of thirteen feet.

We give a sketch of the leaf, which is fleshy, almost leathery;—of the male flowers, which, as will be seen, are not in the least showy, and of the fruit, which is a membranous capsule. The male and female flowers are borne upon different plants.

SOME HINTS TO BEGINNERS IN PLANT-GROWING.

BY GEO. SUCH.

EVERY florist who is desirous of being considered a reasonably good-natured man must occupy no inconsiderable amount of his time in answering questions with regard to the treatment of plants. Most of the questions come, of course, from amateurs, and the burden of complaint is generally that the plants which were received in apparent good health only a few days before, are beginning to wilt and have a sickly appearance, and in fact are behaving in a manner quite at variance with the kind treatment they are receiving in their new home.

Plants are not like men, who may be all smiles in the morning, and without any other cause than "pure cussedness," may be disgustingly bilious and disagreeable in the afternoon; if plants sulkily hang their heads, there must be some good reason for their dissatisfaction, and a helping hint towards ascertaining the cause of the trouble, may perhaps be of interest to some of your readers.

Most florists, to economize space, and also for the purpose of keeping the transportation charges within reasonable bounds, grow their plants in pots of the smallest possible size; consequently the earth in these pots becomes crammed with roots and exceedingly hard. The person receiving the plants is usually struck with astonishment at their pot-bound condition and at once shifts all into pots at least one size larger. This, if well done, is a proper thing to do; but in many cases the work is not well done—the earth in the fresh potting being so loosely put about the old ball of roots that when the plant is watered, the water runs rapidly away through the fresh, open soil, and leaves the earth in the old ball just as dry as snuff. The same thing often happens in transferring pot plants to the open ground, especially if the plants are of large size and the roots fibrous and delicate; unless the ball is well soaked in water before being put into the ground, and unless the earth is carefully packed about the roots, the dry ball so well resists moisture that the plant is liable to die from want of water, even in the midst of abundant rains.

Another and a very common cause of partial if not complete failure in out-door gardening, is owing to the fact that the planting is not made at a proper depth. Canna roots, if put just under the surface, make a growth quite insignificant as compared to the stately masses of foliage thrown up by roots, covered from four to six inches deep. Bulbs are especially liable to suffer from this surface-planting, Gladiolus bulbs and Lillies being at times so lightly covered with soil as to be unable to withstand even a few days of dry weather.

CHINESE YAM OR CINNAMON VINE.

Plants cultivated in the house often suffer from being put into pots very much too large for them. The mass of soil, which is quite out of proportion to their needs, by frequent watering soon gets into such a sour and sodden condition that the roots rot away completely and the plant dies. Even when the amount of soil is not greater than the plant needs, it is quite an easy matter to give too much water to succulents, such as the Cactus family, the Agaves, Crassulas, and others of like habit. In fact these plants when at rest, as most of them are during winter, need scarcely a drop of water and to water them with a free hand at such a time is a mistaken kindness sure to end in their destruction. Some zealous folks not only give too much water, but when from day to day they see the plants taking on a still more sickly look, strong manure is added to the water in such quantities as would clog the digestion of even an onion. There is about as little sense in this treatment as there would be in giving turtle soup to an invalid incapable of assimilating the plainest broth. Not that the use of manure water is to be condemned, for judiciously applied, it is of great benefit, contributing wonderfully to the fine cultivation of most plants.

Many persons lay too much stress, I think, on special mixtures of potting soil, and are apt to attribute want of success to the fact of its being too sandy, or too heavy, or to its containing an insufficient amount of peat. While the choice of a special and proper soil is undoubtedly of advantage, it is not of the vital importance that some persons claim. Most of the old gardeners—and a few even of the more modern—use as much precision in the mixture of their potting soils as a druggist would in making up a prescription, and they insist that any deviation from these rules of mixture would be fatal to success.

It would be easy to give a hundred examples of the folly of this claim, but one will be quite enough. I will mention the case of the Amaryllis, a plant that, since few grow it well, would seem to require very special care as to soil. But see how easily satisfied it is in this regard: LOUIS VAN HOUTTE,* a celebrated grower, uses "pure leaf-mold mixed with some sand"; another equally celebrated cultivator, who has taken many prizes, insists upon the use of nothing but peat. English gardeners, for the most part, recommend a light loam, enriched with old manure; but within a month, one of the best, if not the very best of the English growers of Amaryllis, says he is convinced that the best soil for this plant is a very strong clay loam. Happy patients, who in spite of the disagreement of these learned doctors, all thrive!

One of the points to be remembered by those beginners who grow plants in pots, would seem therefore to be that the mixture of soils is as nothing compared to the keeping of the soil in a healthy condition, free, on the one hand, from the sourness arising from excessive watering, and still not so dry as would be uncongenial to the growth of the roots. Careful observation will soon show when the plant needs water, and then it should be given—not a few drops on the surface, but in such quantity as to soak through the ball of earth thoroughly. The other points of importance are the temperature and the degree of moisture in the air. The temperature is especially to be considered, for it would be folly to attempt to grow a Camelia in a hot-house, or to leave *Cyanophyllum magnificum* suffering in the cold.

South Amboy, N. J.

* Deceased.

GLADIOLI—SUGGESTIONS.

GLADIOLI do not need to be staked, except to support them in case of exceptionally high winds. Especially is this true where they are planted as closely together as they may be without detriment. The leaves of the Gladiolus are not very ornamental—the only word that can justly be spoken against this splendid flower; but where each plant is tied to a stick, its appearance is still further marred. Not at least is it necessary to support them until the buds begin to break. Then a light, unpainted stick—almost a switch indeed, if it can be stuck in the ground without breaking—suffices. Garden stakes in common use are much larger than necessary. We do not know, until we have tried it, how slight a support will hold plants during the strongest winds of summer. The bulbs are not, as a rule, planted deeply enough, though this must of course be varied to suit the soil. For large bulbs in sandy soil, six inches are not too deep. This secures moisture to the bulbs during drouths, and serves the additional purpose of supporting the stem. If our readers have not planted their bulbs deeply enough, soil may be thrown upon the surface where they are massed, thus producing the same effect.

Where drouths prevail, drenching the beds with water and covering with grass will improve the flowers and prolong the flowering period, though where they are growing in full sunshine, such heat as has prevailed for two weeks past, whether the ground has been moist or dry, will scorch the buds and wither the petals in a day. Yet we have never found that the Gladiolus thrives best in shade or partial shade. The finest displays we have ever seen were upon rich sandy soil in full sunshine. The leaves and corms will stand both sun and drought—it is the flowers alone that suffer.

We remind our readers that now is the time to mark flowers for seed, or to cross selected flowers with a view of producing finer strains and more pleasing colors and markings.

Field Crops.

REAL VALUE OF GOOD NATURAL GRASS LAND.

WHEN it is so repeatedly stated that England is more than half in permanent grass, that within a few years a great deal more has been taken from the plowed portion never to be cultivated by the plow or turned over again, it ought to be convincing as to the profit from grass being more than from grain, and if a small island so overpopulated as to require an immense importation of human food can increase her area of perpetual grass, there must be a vast advantage in leaving undisturbed by cultivation all the best land. Yet, here in America, all the fine tracts of the blue and other native grasses, which are well known to fatten cattle and sheep, or, in fact, every grass-eating animal, are broken up and plowed for the purpose of taking all the plant food which the grass feeds on, to grow wheat to send away, thus impoverishing the country. For the money received for all the wheat does not enrich the inhabitants, as they have to pay all of it, and more added, to buy wool and cloth and clothing of all kinds, which wool would make, if the grass and virgin soil was spared to grow wool instead of wheat.

Let that quack farmer, Mr. MECHI, come over to this continent and see the havoc made by the plow, and he would never more blame the landowners of England for their zealous protection of the meadows and pastures. Could anything be stronger proof of the real value of good natural grass land than the fact of farms having more than half grass, or fully two-thirds as mowings and pastures, being always more sought after than others. Moreover, it is notorious and beyond contradiction that a good farmer with capital, renting a farm of say from 300 to 500 acres, with about the proportion of grass land stated, which he can never plow, is better situated than any who have all arable farms, and also, it can be added, in making more money than any farmer on this side of the ocean who owns his land. This is worth consideration, for he pays more in taxes, has no protection, and his rent at least $10 per acre.

Good natural grass land in America, if not violated and robbed of its plant food, would pay well, for all the animals raised by its aid, all the butter, wool or meat produced are nearer clear profit than aught else, and men of capital who would, like English noblemen, hold this uninterruptedly in grass, only using such as was not so well adapted for permanency, would not have a quantity of unsalable, exhausted soil on their hands. In the West, and especially in the Southwest, there are men who are what is termed "land poor." They own a great many acres, which they have rented to laboring men on shares, and some at money rental, but in either case, the land gradually becomes weaker, and after a few revivals of clover, the deepest, best soil succumbs, and poverty results to the soil and to all owners who have not invested the cash as received.

WORKING FARMER.

ABOUT HOPS.

AT a meeting of the Maidstone Farmers' Club, (Eng.) the other day, Mr. Joseph Barling of Maidstone, referring to the opinion of some writers that the quality and quantity of lupulin in the hops was supposed by some to be affected by the presence of the male seed upon the female flower, said:—Last year the season was wet when the hop was in burr, and it might have been noticed afterwards that it did not contain its usual number of seeds. He opened a number of hops and found some seeds in each, but a great many were missing. Those who charged the farmer with neglect in not cultivating the male hop, would probably have said at once that this lack of seed was caused by the absence of a sufficiency of male plants, but further examination showed that there was no want of lupulin, but the rain had washed away its proper receptacles, in the glutinous matter formed to hold it. After contending that hops in a carefully cultivated ground, where there were no male plants, would do better than those in a less carefully tended plantation where they might be found, Mr. Barling said a question to be decided was whether the impregnation by pollen was the only means of fructification. There was ground for believing that those very grains of lupulin which were so early developed on the young hop were exactly identical, both in form and impregnating power, with the pollen of the male plant.

Supposing there was a hop-garden with no male plant within a mile, and the hops produced seeds which weighed as much as any other, the question arose whether the offspring of these so impregnated seeds—impregnated with lupulin instead of pollen—would produce a plant with the characteristics of one or two parents. In all probability it would only produce the characteristics of the hop on which the female blossom and the impregnating pollen grow; and this was a question of importance, because the hops that were now cultivated had all been selected for some special quality observed in them. The only way to determine this would be to go through a course of isolated cultivation and study, extending probably over several years, and there was so much doubt as to the result even then that he was not surprised that hop planters had been backward at trying the experiment. A brief discussion followed, in which the opinion was generally expressed that the so-called male hop was little better than a weed, and useless to cultivate, and Mr. Stonham assured the Club that on his best grounds there was not a single plant of the kind.

POTATOES.—Save the small potatoes for there will be a scarcity in potato beetle regions.

Pomological.

PROPAGATING PLANTS BY BUDDING.

Budding and grafting, and similar methods of propagating plants, have been practiced for many centuries, and a full description of how the work is performed has been given in thousands of horticultural works, as well as in millions of periodicals distributed throughout the civilized world. Still, each succeeding generation requires a repetition of the same, just as each has to begin with the alphabet if it would learn to read or make further progress in literature.

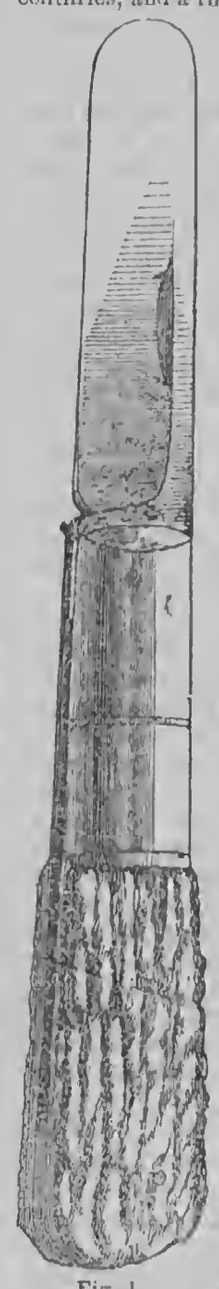

Fig. 1.

Every year, as summer approaches, we receive inquiries in regard to propagating plants by budding, which is conclusive proof that there are many young men, and perhaps old ones, who are still in need of information on this subject, and it is these whom we particularly address at this time.

WHAT IS BUDDING?

The art of budding is the taking of a bud with a small portion of the adjoining bark from one plant and inserting it under the bark of another, or into some part of the plant from which it was taken. The general principle which governs the operation is that there must exist an affinity between the plant from which the bud is taken and the one upon which it is placed, and the nearer the relationship the more readily will it unite and the more permanent will be the union.

The peach, plum, cherry, and similar stone fruits will not unite with the pear, apple, or quince; therefore, in propagating by budding, as well as by grafting, we are compelled to keep within certain limits, although the possibilities of the operation may not be as yet fully determined. But for all practical purposes, we may say that the nearer the relationship between the bud and the stock into which it is inserted, the better will be our success.

The peach may be budded on plum stocks, and plums on the peach; but for general culture, each on its own seedling stock is preferable. Pears are also budded upon thorn, apple and quince stocks, for the purpose of making the trees assume a more dwarfish habit, and the tall-growing species of apple budded upon low-growing; but in each and every instance the same rules hold good in performing the operation.

Fig. 2.

In budding, it is very important that the bark of the stock should part readily from the wood, and to secure this it is necessary that the operation should be performed when the flow of sap is abundant, because if the bud were inserted at any other time it would not find the nourishment that it requires for its support. But very often instances arise where good judgment is needed to avoid budding too early in the season; as well as too late, as some kinds of stocks in certain seasons grow so rapidly that buds inserted very early will be overgrown by the bark and young wood and destroyed. In budding the peach and cherry, especially when growing in very rich soil, this sometimes occurs when the operator is in too much haste to get his work done early in summer.

THE BEST TIME FOR BUDDING.

The question is frequently asked, "Which is the best month in summer for budding?" but no exact time can be given which would suit all localities. The condition of the stock must be our only guide to this part of the operation. It is better, however, to wait until the most vigorous growth is past, but not entirely ceased, before budding. The stocks may be in proper condition in the latitude of New York City in the month of July, but we have delayed budding cherry stocks until the middle of September with the best results. As a rule, however, the greater part of the budding done in the Northern States is during the latter part of July and August.

MATERIALS USED IN BUDDING.

A small knife is necessary for preparing the buds for insertion, as well as for making an incision in the bark of the stock, together with a quantity of some material to tie around the bark to hold the bud in place. There are various styles of budding-knives in use, some with long, thin, ivory handles, with which the bark on the stock is raised to admit the bud, but what is called the "American Budding-Knife" (shown in Fig. 1) is the one principally used in this country, and is preferable to any other. It is simply a small pocket-knife with a thin blade, round at the end. The cutting portion extends about one-third around the end of the blade and about two-thirds of its length, leaving the lower part dull.

The material commonly used for tying in the buds is called "bass," and it can be procured at any seed store, or from bass mats. It can also be obtained from the bark of basswood trees by stripping it off in spring and immersing it in water until the inner portions separate into thin layers. The thin bark of other kinds of trees may also be used for this purpose, and even thin muslin, woolen yarn, or candle wick, the kind of material not being of so much moment as the convenience in using it.

SELECTING BUDS.

In selecting buds the young shoots of the present season's growth are generally preferred, and they should be taken from the most healthy, but not always the largest shoots, the object being to obtain plump, well-developed buds, not those too old and partially overgrown with bark, nor those too young and soft. The leaves should be removed as soon as the shoot is taken from the parent plant, but in doing this it is well to leave a portion of the leaf-stalk attached to the twig (as shown in Fig. 2, which represents a shoot from a pear tree trimmed for use). The soft, half-formed buds at the terminal end of a shoot, if there are any, are usually rejected, also those at the base, if not plump.

Fig. 3.

HOW TO INSERT A BUD.

Take the branch in the left hand, with the small end toward the body, insert the knife blade a half inch below the bud, cutting through the bark and slightly into the wood, passing it under the bud and bringing it about the same distance above it, thereby removing the bud with the bark and a thin slice of the wood underneath (as shown at *c*, Fig. 2); then, if using the American Budding-Knife, let the forefinger clasp the lower part of the blade as it is held in the right hand, make a horizontal incision in the stock first, and from this an incision downward, about an inch long and only through the bark; lift up the edge of the bark by passing the back of the blade up to the horizontal incision without removing it; then lift the edge of the other side in a similar manner. The two incisions will make a wound in the stock resembling the letter T (as shown in Fig. 3). If the bark parts freely from the wood, it will not be necessary to pass the blade under the bark the entire length of the incision at the edges near the upper end. While doing this the expert budder will hold the bud in his left hand, and at the moment the knife is being withdrawn from the wound the lower part of the bark to which the wood is attached will be inserted and thrust down into place and the whole operation performed in less than one-fifth of the time it takes one to describe it. If the upper end of the bark of the bud does not pass completely under the bark of the stock, it must be cut across so as to join the cross incision in the stock. The bud is then tied in by winding the stock with bass or other kind of string, leaving the point of the bud and leaf-stalk uncovered.

Of course the operation may be varied in many ways, but the above is essentially the general mode of operation. The twigs may not be larger than a knitting-needle in some cases, as for instance, in budding the Weeping Cherry and the branch or stock into which they are inserted, but slightly larger; or, as is frequently the case with Magnolias, the buds are taken from branches as large as a man's finger and inserted into stocks an inch in diameter, and the same care, to insure success, is required in all cases; but the stock should always be a little larger than the branch from which the buds have been taken.

After the buds have united with the stock (which usually occurs in two or three weeks, or less), it is well to cut the ties, in order to admit of expansion, especially if the weather is favorable to the continuance of growth. Buds set in the summer and fall are expected to remain dormant until spring, at which time the stocks above are cut away, which forces them into growth. Sometimes the buds will start in the fall. When this occurs, the young growth is very liable to be killed by the cold of winter. This is one reason why budding too early in the season should be avoided. By a few experiments and close attention, almost any boy or girl can learn to bud almost any kind of woody plant from a rose bush to an apple tree; and more is the pity that all do not try, for it is both a pleasant and profitable pastime.

TWO SURPRISE RASPBERRIES.

We notice in one of our exchanges that a Mr. H. G. Breese of Hoosick, N. Y., has introduced a new Raspberry under the name of "Surprise." It is said to be a dark-red variety of the Black-cap species, and, as usual with such things, the originator claims for it numerous and wonderful merits. Of this, however, we have nothing to say, but would remind Mr. Breese that the name "Surprise" for a raspberry of the *Rubus occidentalis* species was long since used by Mr. Samuel Miller for one of his seedlings, which, by the way, is one of the best of its class. It would be a very foolish proceeding, to say the least, for Mr. B. or any one else to duplicate this name "Surprise," and especially to have it bestowed upon two varieties of the same species. We hope Mr. Breese will select some other name for his new raspberry, and thereby avoid the confusion which is certain to follow if the present name be retained.

THAT NEW GOOSEBERRY.

Not long since we received a small box of gooseberries from E. P. Roe, raised upon his place "up the Hudson." If the berries sent to us were really of pure native blood, then we should consider the variety a very promising one; but if a seedling from a foreign sort, it is scarcely worth a name, for there are hundreds far superior.

We want to know more of this sort before giving an opinion. From what native sort is it a seedling, where were the seed sown, and what care, if any, was bestowed to prevent any seed of a foreign sort getting in among them? Then again, has the plant a foliage resembling any of our species, and if so, which one? Mr. Roe may have one of the best and most valuable native gooseberries ever seen in this country, but we cannot "enthuse" over it without knowing more about its parentage and appearance.

Sheep Husbandry.

COLLIE DOG TRIALS IN ENGLAND.

Denounce the dog as much as we may, man will cling to him as he does to man, through all vicissitudes of life or persecutions of either race. There appears to have ever been a bond of affection between men and dogs which no change of time or circumstances can break, hence it has become a saying that "love me, love my dog," are synonymous terms, and however much men may differ in opinions in regard to the economic value of dogs in general, they are like the poor "who are ever with us," hence we believe it is policy on our part to make the most of the canine race whether viewed upon the whole as a curse or blessing. In Great Britain the dog is a recognized member of society in good *social* standing and his education receives due attention in order that he shall fill the position with credit to himself and master.

Now if our streets are filled with miserable mongrel curs, and the farmer's flocks worried with sheep-killing brutes, men are at fault not the dogs, for they only exhibit their natural instincts just as we do in defending ourselves and property against their attacks. But to change all this it is not necessary to kill off all the dogs or deprive man of his company, but merely to select higher and more useful types, and then attend to their early education. If our farmers would pay some attention to the importing of good shepherd dogs they need have little fear of the sheep-killing breeds.

But to awaken an interest in these matters we need a few exhibitions of the skill of dogs in managing sheep as frequently shown in the dog trials on the other side of the Atlantic. The late exhibition of Collie dog trials at Alexandria Park in England, gave a very fair idea of what this sagacious and valuable breed may do when properly trained. A report of this trial appeared in the Standard, from which we make a few extracts:

An interesting trial of collies at work—some 20 or 30 entries having been made—has been going on during the past week. Pens half a mile apart in the park were employed. The dog standing with his master at the empty one was directed by word towards the other, in which were three sheep (fresh from the hills), and these were unpenned as the dog approached, and had to be driven and penned within the hurdles half a mile off.

"The man and dog walked together along the racecourse until the sheep were sighted, when he gave a sign or a word to his four-footed companion and the intelligent brute at once started off at a gallop, and sought first to drive the sheep down the hill towards his master. When he had succeeded in doing this the man walked towards the pen and the dog drove the sheep after him until they were near enough to cooperate in getting the sheep inside. Twenty minutes was the maximum time allowed, the prizes being won by those which succeeded in penning their sheep in the shortest time, while those which failed to pen within the allotted time were disqualified. It was not difficult to discover that dogs and sheep were working under great disadvantages, and animals which have no doubt a well-deserved reputation on their own hills failed to distinguish themselves under totally novel conditions, though enough was demonstrated to make it apparent that these collie trials are likely to become a very interesting annual performance. Though a space of ground was marked off by ropes and stakes, which were respected by the spectators, the sheep felt under no restrictions, and the poor collie, therefore, that had been used to the clear view of a Welsh hill side, with no human being but his master within miles of him, had to dodge his charges among visitors and round plantations, which frequently hid them altogether. The sheep were many of them very wild and ran like deer, their disinclination to proceed in the direction of the pen being increased from the main flock being in full view and thus stimulating the natural ovine tendency to rejoin companions. In several cases, on the dog nearing the three sheep, the nimble and independent wethers scattered and galloped in different directions out of sight, when the collie, after an honest attempt to bring them together, seemed to conclude that it was hopeless to complete the task in 20 minutes, so he philosophically dropped it altogether and trotted back to his master. Some of the trials of wethers behaved in a manner more in accordance with the gregarious traditions of their race, and when in addition to hanging together they happened to start in the right direction down hill, the first portion of the dog's work was easily and speedily done. The marvelous sagacity of the breed was seen when the sheep were near the pen and the dog had to overcome their natural disinclination to enter. Not only did the animal in this position obey every sign and word of his master, but he would exercise what might almost be called his own reason and discretion in the mode of carrying out his master's wishes in a fashion that was astonishing. Success, however, depended altogether on the behavior of the three particular sheep. One famous dog, named Handy, which won the champion prize two years running in Wales, was very unfortunate in this respect. He succeeded in getting them to the pen in splendid style, but nothing could induce the brutes to enter. They broke away a score of times and after a display of ability worthy of his high reputation, poor Handy failed to accomplish the task within the 20 minutes. The most successful performance was that by a dog named Maddie, belonging to Mr. John Thomas of Bala. Favored by tractable wethers she succeeded in a little over four minutes. A famous dog named Boy did the work in seven and a-half minutes. Another called Laddie took nine minutes and two others, Pentre and Tweed, 12 minutes each. There were 19 entries for the All-Aged Stakes, and these were tested."

FOOT ROT IN SHEEP.

When foot rot has been for some weeks neglected and the sheep continue on soft ground, which favors the superabundant growth of degenerate horn, it becomes confirmed and difficult of cure. The secreting textures persist in pouring out lymph and weak, faulty horn, instead of the tough, firm, protecting covering of the healthy foot. The first step, however, must be to (with a strong, sharp knife, while the hoofs are soft) carefully cut away all loose, unsound horn. Where the hoof is extensively affected, this cannot be done all at once; two or three operations will be necessary. Fungus is got rid of by using butter of antimony, mixed with equal parts of impure carbolic acid, diluted with two or three parts of oil. Copper sulphate ointment, in the proportion of one to four of fatty matter, is used in some districts.

Domestic Economy.

HOME KEEPING.

It is seldom that we have read anything which smacks so much of genuine truth as the following from the Western Farm Journal, and we would commend it to those who may think keeping a home is a less responsible or noble occupation than filling a niche in any other position in life.

With what enthusiasm the young housekeeper enters her clean, bright, attractive kitchen. With what a glow of delight she engages in her duties. Everything is new, pure, untarnished. The sunshine gleams in rows of bright tin, the shelves are free from even a hint of dust, and the surface of the china is smooth and polished. The tea-kettle sings cheerily away on the stove. How delightful is work with such surroundings. How keenly and with what alacrity she enters upon her duties. With what dispatch the work is disposed of. How foolish in her once to dread housekeeping.

But there comes a time when all this is changed. No longer the bright surface of the tin and kitchen utensils reflect the rays of the morning sun. They are too dingy and dirty to reflect anything. As she opens the door of her cupboard, disorder and uncleanliness stare at her from every corner. Spots of grease disfigure the kitchen floor, and the stove is, in appearance, far, very far from suggesting a fit place for the preparation of anything one would wish to eat.

She realizes then that vigilance is the price of cleanliness and order as well as liberty. Then the thought comes with bitterness, perhaps, that it is a daily hand to hand fight with dirt and disorder that must be maintained to secure surroundings in which work can be done cheerfully and successfully. Then as she brightens the tins, cleans the cupboard and scrubs the floor, she feels the drudgery of house-work. It will be acknowledged that to go over the same round of duties every day, week in, week out, for months and years, becomes tiresome. To cook, wash dishes, sweep, dust, and perform all the multifarious tasks pertaining to housekeeping, savors very much of drudgery, indeed *is* drudgery.

But while you, my friend, wield the scrubbing-brush, flourish the broom or mop, and envy those in other departments of labor their immunity from household drudgery, know that there is drudgery pertaining to all employment, a drudgery more exhausting, more unceasing than yours. There is a thrill of exquisite joy in the soul of the poet when a new and beautiful idea comes to him, but the working out of that thought in expression, is labor of the severest kind.

"But then he has a poem," you say, exultingly, "and I only a clean floor." Only that and nothing more. You have much more. For I imagine your efforts will not end with the cleaning of your floor, but the lesson you learn there will show itself in other departments until you possess what should be the highest aim of every woman, a well-ordered household, a neat, attractive, delightful home.

A home! Is not that as good as a poem? People can live and thrive without poetry, but the lack of homes has been the ruin of many.

To make a home, all the little details of every-day life, that sometimes seem so small, so trifling, so far beneath the dignity of intelligent womanhood, duties that the veriest drudge can perform, are of importance.

Successful home-making is one of the problems of the age. If you, oh! patient housewife, in your quiet corner of the world, unobtrusively working, practically solve the question which taxes the intellects of the wise and gifted, solve it by entering heartily and cheerfully into all the details of your work, have you labored in vain? And if this be repeated in the thousand homes of our land, will not the foundations of our nation stand so strong and firm that all the opening flood-gates of evil will not be able to prevail against them?

Lift up your head, then, toiling on; magnify your office. Place yourself, as you have a right, among those who are doing the noble abiding work of the world. Exalt your lowly duties to the level of your high conception of what a home is and what it means. Then no work will seem mean, no duty trifling. Then we will hear no more of the drudgery of house-work than of the drudgery of painting a picture, or writing a poem.

SELECTED RECIPES.

Tomato Soup.—Two quarts of beef stock, two onions, one carrot, one turnip, a sprig or two of parsley. Peel and cut the vegetables fine. Boil them in the stock one hour, then strain the stock carefully—not allowing any of the vegetables to pass through the seive. Add two quarts of peeled tomatoes; boil three-quarters of an hour. Then, in a large saucepan, put two tablespoonfuls of butter, and heat until it is a light brown. Take this from the fire, add it to the stock; put in one tablespoonful of sugar, three tablespoonfuls of flour, made smooth in a little cold water; stir well until it boils; skim, and send to table in a soup tureen.

Potato Soup.—Boil eight potatoes and one good-sized onion until tender; strain through a seive; add one quart of milk, salt and pepper to taste, and nearly one teacup of butter; put all in a saucepan and let it come to a boil. Serve hot.

Chocolate Pudding.—One-half cake of chocolate, grated; one-half pint of soda-cracker crumbs; butter the size of an egg; one pint of milk; white of six eggs well beaten; sugar and salt to taste. Boil in a mold one hour. To be eaten hot with cream, or wine sauce.

Apple Pudding.—Eight apples grated; the same quantity of stale bread; three eggs; one and a half pints of milk; sugar and flavoring to taste. Bake one hour in a slow oven. To be eaten with cream.

Egg Blanc Mange.—Two-thirds of a box of gelatine; one quart of milk; one cup of sugar; six eggs; salt and flavoring to taste. Put the gelatine into the milk; set it on the back of the stove until it is dissolved, then add the sugar; beat the yolks of the eggs until they are very light; add a gill of cold milk to them when the milk on the stove is scalding hot; put the eggs in; stir constantly until it is done, which will be in a few moments. If allowed to remain on the fire too long it will curdle. Take from the fire and continue to stir it gently until it is quite cold, then put the mixture into a mold and set on ice. To be eaten with cream.

ORIGINAL RECIPES.

Breakfast Cakes.—One pint of sweet milk; two tablespoonfuls of butter; one heaping teaspoonful of baking powder, worked thoroughly through flour enough to make a batter not very stiff. Bake in gem pans in a quick oven.

Graham Bread.—Just before retiring at night, dissolve a yeast cake in a teacup of tepid water; add fine flour to make a batter; cover, and set in a warm place. The first thing in the morning, add nearly a pint of tepid water; one teaspoonful of salt; a half teaspoonful of baking soda; two tablespoonfuls of sugar; one teacup of fine flour, and Graham flour enough to make a stiff batter; put the mixture in a bread pan; set it in a warm place until sufficiently light, (which should be about two hours). Bake in a moderate oven.

Veal Cutlets.—Cut the veal in good, fair slices; salt and pepper them; have ready a generous supply of hot butter, or part butter and lard, in which to fry them. When the meat is nearly cooked, dip each slice in a well-beaten egg, then in rolled crackers; return to the fire until they are a delicate brown. Send to the table hot.

MRS. RUSTIC.

Raised Biscuit.—One pint of sponge; coffee-cup of lard or butter; knead, and put to rise. When light, make out and raise a little while the second time, and bake in quick oven. As splendid as biscuit can be.

Cream Pie.—For the cake, two cups of sugar; piece of butter the size of two eggs; four eggs; two spoonfuls cream of tarter; one of soda; three cups of flour. Bake in jelly-cake pans, or in a single cake, and split as one chooses. For the cream, one pint of milk; two eggs; a cup of sugar; half a cup of flour. Beat the eggs, sugar and flour together; pour in the milk and put over fire until it thickens, stirring all the while; flavor to taste. When cold, spread between layers of cake. This is a fussy recipe, but excellent.

Lemon Jelly.—One package of Cox's gelatine; add one pint of cold water; juice of six lemons; let them stand one hour; then add one quart of boiling water; two lbs. of white crust sugar; strain, and put to cool.

Summer Mince Pie.—Four crackers; one and a half cups sugar; one cup molasses; one cup cider; two-thirds cup of butter; one cup chopped raisins; half cup currants; two eggs, well beaten; brandy and spice to taste.

Lemon Pie.—One lemon; two-third cup of powdered sugar; two eggs; three tablespoonfuls of flour; one teacup of milk; grate rind of lemon; put the rind and juice of lemon, the yelk of the eggs, sugar and flour together; add the milk the last thing; line a deep tin plate with paste; and pour the custard into it. When cooked, spread over the top the whites of two eggs, beaten to a froth, with four tablespoonfuls of powdered sugar; meringue flavored to taste, generally with vanilla. Return to oven and bake to light brown.

A. M. S.

Warts.—Tie a hair or fine silk thread tight around the wart; wear it until the wart drops off; then rub caustic deep into the place. Result, a cure.

Hygienic Information.

SLEEP.

While speaking of the importance of persons sleeping in order to keep up the strength of the body, Dr. N. Green says:

"Thousands of busy people ruin the health, and many die every year for want of sleep. It may be that some are injured by too much sleep; but, an excitable people and in those of intense business habits, there is far more mischief done from want of sleep. Sleeplessness often becomes a habit and is very injurious to health. It sometimes results from disease, showing unmistakable evidence of a breaking down of the mental powers, and is often a precursor of insanity. When it does not reach that sad result, it is still full of peril as well as of suffering. Thousands of men have been indebted for bad bargains, for lack of courage and ineffectiveness, to loss of sleep.

Healthy and natural sleep repairs the wastes which the waking hours have made. It rebuilds the system. The night is the repair shop of the body. In the relaxed condition of the system during natural sleep, every part is silently overhauled and all the organs, tissues and substances are replenished. Waking consumes, sleep, replaces; waking exhausts, sleep repairs.

We live by a process of destruction. Force in the human body is manifested by the decomposition of its component particles. Life manifests itself as a result of chemical decomposition of particles, and as these particles or cells are destroyed or devitalized, they must be removed, and their place supplied by new cells.

During the daytime the amount of vital force expended counterbalances, or rather uses up, the material prepared by digestion and assimilation. But at night, when the expenditure of force in voluntary life is at its minimum, not only is the blood freed from the impurities of worn-out and broken-down particles, but new tissue is formed and the body gains in weight. We grow mostly during sleep; for then the products of nutrition, which during the day are used in replacing the constant waste of the system, are employed in building new tissue.

That the system may be properly repaired during sleep, the material must be received and digested during the day. Food to be in a proper condition to supply and rebuild the system, must be taken and digested during the waking hours. That digestion may go on during sleep cannot be doubted, as any organ of the economy may, for a time, be forced to perform more than its normal amount of labor. But the stomach, often being kept constantly at work during the day, requires rest at night, and can be recuperated only during the hours of sleep; and although digestion may go on, such sleep will be disturbed and unrefreshing. The brain and nervous system are also built up and restored only during sleep.

A man has as much force in him as he has provided for, by sleep and the proper assimilation of food. The quality of action, especially mental activity, depends upon the quality of sleep and nutrition.

Such being the necessities of the case and the inexorable law of Nature, it behooves us, as rational beings, to study and obey the laws that govern our physical and mental organization. The importance of sleep, as a recuperative agent, has been almost entirely overlooked; and many, even among the learned, act as if they thought sleep of but little consequence and the time so spent lost. But Nature has decided otherwise. The integrity of neither body nor mind can be long maintained without sleep. Health, happiness, strength of mind and personal beauty, are as dependent upon sleep as upon any other requirement of the animal economy.

MILK DIET.

"I find by experience," says E. N. Chapman, "that lime water and milk are not only food and medicine at an early period of life, but also at a later, when, as in the case of infants, the functions of digestion and assimilation have been seriously impaired. A stomach taxed by gluttony, irritated by improper food, inflamed by alcohol, enfeebled by disease, or otherwise unfitted for its duties, as is shown by the various symptoms attendant upon indigestion, dyspepsia, diarrhœa, dysentery and fever, will resume its work and do it energetically, on an exclusive diet of lime water and milk. A goblet of cow's milk, to which four tablespoonfuls of lime water have been added, will agree with any person, however objectionable the plain article may be, will be friendly to the stomach when other food is oppressive and will be digested when all else fails to afford nourishment. Of this statement I have had positive proof in very many cases. "The blood being thin, the nerves weak, the nutrition poor, the secretions defective, and excretions insufficient, the physician has at hand a remedy as common as the air, and as cheap almost as water. In it all the elements of nutrition are so prepared by Nature as to be readily adapted to the infant or the adult stomach, and so freighted with healing virtues as to work a cure when drugs are worse than useless.

Insurance Department.

INSURANCE NOTES AND NEWS.

Insurance Supervision.—We have little faith in the possibility of useful results from legislative interference with the management of insurance companies and less still in the protective appliances of the existing system of State supervision. Two years ago we shared the common delusion that the State could control the companies by means of a special department and certain unexplained inquisitorial means, and could, and did, guarantee the continued solvency and fair dealing of the companies entitled to license. Observation has shown this to be a very mischievous mistake, which putting all the companies on the same footing injured the better and enabled the worse to obtain patronage without deserving it and betray a confiding public. There are few if any instances in which the departments have interfered successfully to prevent failure and fewer perhaps of successful appeal by aggrieved policy holders, though honest, earnest and capable Superintendents have done all they could and excited our sympathy by lamenting the futility of their endeavors to catch rogues who were stronger than the law and shrewder than the law makers. No good company has been made better by the hampering requirements of the insurance code, nor bad one renovated by its coercive measures.

A Great Luxury.—It does not cost much to purchase necessities, the things indispensable to mere animal life. The heaviest outlay goes for things that promote happiness by pleasing the taste and gratifying the ambition. A life insurance policy is not a physical necessity to the head of a family. He may exist without it but if he is a conscientious man, one who loves his family, who fears that his life may end before he has made ample provisions for them he can buy more content and serene happiness by investing money in a policy with a first class company than in any other known way. It is the price of serenity through life and content on the death bed.

Increase of Capital.—Several leading fire insurance companies propose an increase of capital. This is a move in the right direction which we cannot too highly commend. It does not matter much to the policy holders whose security is enhanced by every additional dollar, whether there is an increase of stock capital, of capitalized surplus or surplus reserved; so long as it is a dollar more of money to pay losses with and available for that purpose it is a matter of indifference to us, and should be to the insured, what technical name it goes by. We should like to see all the companies double their resources.

Entomological.

THE CRANBERRY WORM.

A correspondent of the Tribune writing from Ocean Co., N. J., reports that what is locally known as the fire-worm recently attacked a number of cranberry plantations in the vicinity of Tom's River, N. J., and the work of the pest has been very destructive. In conversing with a number of growers, I learn that the loss caused by the ravages of the worm during the past six days will probably amount to $20,000, and this is thought to be a by no means exaggerated estimate. One grower estimating the crop of one bog by that of last year, when the field was scarcely an average, says his loss cannot be less than $2,000, and his bog is only one of many. In Jackson and Brick townships—where the area of cranberry land under cultivation is larger than in other sections of the county—the worm has not yet appeared, and until the present drouth became serious, the prospect for a large crop was thought to be unusually favorable. It is now (July 8) more than two weeks since there has been any rain in these localities, and as a consequence, many of the plantations are suffering greatly, especially the savanna lands, where the young fruit is being generally pinched. If the drouth should continue another week, the effect will be to materially reduce the prospective crop, as well as to operate unfavorably upon the size of the fruit. It is reported that the worms are now in Berkley and Lacey townships, but that Eagleswood and Stafford have not been visited by them. These localities have been favored with showers since the more northern portions of the country have had rain, and are not suffering so much for the want of water. There are not, of course, any indications of scald as yet, but an examination of the young fruit shows that about the usual percentage of it has been stung. Grapes are rotting somewhat, and the raspberry, blackberry and whortleberry crops have been greatly injured by the drouth. If rain does not come very soon the blackberry crop will be an utter failure, as the fruit is now drying up on the bushes.

PREPARING FOR THE FAIRS.

On another page we give a list of state and local fairs to be held during the autumn months. A few words in commendation of these useful organizations, as well as the patronage which they should receive at the hands of the public is quite opportune at this time. It is to be regretted that agricultural and horticultural societies receive far less patronage than their importance demand, not only from those persons whose calling makes them most directly interested, but from the public at large. The residents of cities and villages who are not tillers of the soil, seldom consider themselves interested parties when there is to be an exhibition of the products of the farm or garden, or that these shows call for any special attentions or support on their part, hence they take little interest beyond the opportunity of whiling away an hour or two among the cattle, cabbages and roses or to see the fun at the plowing match, or horse trot, forgetting, if not particularly interested as producers, they cannot avoid being so as consumers.

They may not care who raises the largest or best beets, or makes the best butter, or how it is done, but the fact of its being done cannot fail to interest them. For these reasons if nothing else, every individual should consider himself personally interested in the products of the soil. The residents of our cities and villages often complain of the poor fruits and vegetables which they are forced to purchase in market in the absence of better, but few of them ever think that any change could be made through their direct influence, as it doubtless never entered their heads that supply follows demand.

If those who desire the best of everything will learn what to ask for there is little doubt of its being furnished and there is no better place of obtaining this information than at the hundreds of agricultural and horticultural fairs held annually throughout the country. If you would have your butcher keep Southdown mutton, Short-Horn beef, Aylesbury Ducks, Brahma fowls, or any of the choice breeds of poultry noted for their fine flesh, go to the fairs and learn their respective valuable properties. Ignorance on the part of consumers in not knowing what to ask for, tends to perpetuate the same in producers, as well as to discourage attempts at improvement which would be beneficial to both. These two classes need to come together and get acquainted, and not leave their individual interests entirely in the hands of a "go-between" known as the middleman or commission merchant. A little time and money spent by the residents of our cities in going to country fairs, would be very beneficial all around, both financially and fraternally.

The farmers and other residents of the country who are presumed to take especial interest in exhibiting their products, do not always do their full duty in keeping up the associations to which they do or should belong. There are often trifling petty jealousies which interfere sadly in securing harmony between managers and exhibitors—failures resulting where great successes might have been obtained under a different state of affairs. Personal feelings and favors should be laid aside as much as possible at such times and all unite as one man to work for the good of the community. It must not be expected that each exhibitor can obtain a prize where there is sharp competition, and every one should feel it his duty as well as pleasure to make the best show he can and, if beaten, be thankful that there is something to be learned and still room for improvement.

If a neighbor can make better butter or cheese than yourself, do not be vexed at learning the fact, but strive to find out how it is done and then try him again at the next Fair. Do the same with fruits, grain—in fact, all kinds of farm products—but of all things, do not let conceit get the better of judgment, provoking a disclaimer against fairs and a withdrawal of your support of the association.

Furthermore, do not fail to send something to the fair, even if there is not the slightest chance of winning a prize; but show a good will and a liberal heart by doing all you can to help make up a grand exhibit. Take the wife and children along and urge upon your neighbors to do the same; and when arriving on the grounds don't go about finding fault or telling everybody that you have better sheep, cows or other stock at home than there is on exhibition, and had you thought neighbor BROWN was going to show his vegetables, you would have beaten him, with plenty to spare. Instead of this, look smiling, praise everybody for what he or she has done in the way of making a show. If fault is found with the assistants on the grounds or managers, do not join in with the grumblers, but put in a "smoothing" word, and as much as hint that the time was short in which to make all the necessary arrangements and that there is a limit to human efforts.

Go to the fairs, one and all, is our advice to the readers of the RURAL NEW-YORKER, and make each and every one a grand success in this, our Centennial year.

WHY NOT TRY IT?

If people would learn to be more skeptical and less confiding, truth might in a great measure take the place of error. But it is so much easier to accept a statement as truth than to investigate and *know* it, that a majority of persons choose the former, absorbing what is generally termed knowledge just as a sponge does water, taking in the impure as readily as the pure, possessing neither a desire or power of making a selection. This is especially the case in most things pertaining to "Rural Affairs," hence the repeated and constant circulation of the most nonsensical and ridiculous statements in regard to the habits of plants and animals, as well as the influence of the planets on the same.

Now, we do not believe any man ever conducted a series of experiments for the purpose of determining whether the moon had any perceptible influence upon plants or animals on this earth, without coming to the conclusion that all assertions in the affirmative were erroneous, or so near to it as not to be worthy of a moment's consideration. If the believers in the moon's influence would only stop to think that they are in an infinitely small minority—taking mankind as a whole—and that 999 out of every 1,000 persons in the world pay no attention to such signs, and still they succeed just as well or better, than those who take them as a guide.

But it is not altogether of these mysteries which have been handed down from father to son until they have become "bred in the bone" that we complain of, but of the hundreds of minor items of knowledge which seem to pass current, few questioning their truthfulness. Time and time again have we heard it stated that the seed of the common cress, or cheat, would not germinate; while the men making the statements could have convinced themselves of this error by sowing a few seeds in a flower pot filled with sand, if they did not care to trust them in the open ground. Hundreds of times has it been said that cions of peach, apple, plum and similar fruits, if set in a stock top-end down, would produce fruit having neither core nor seed. Practical men have tested this method of grafting and learned that inverting of a cutting or cion has no influence whatever on the fruit, and those who still persist in repeating such errors probably do not want to know the truth. Grafting peaches upon willows in order to produce stoneless fruit, is another process recommended by persons who never tried it, nor do not know that the peach fails to unite or grow upon the willow.

Similar errors are promulgated in regard to the various domesticated animals as well as plants and insects, many of which might readily be disposed of by the slightest investigation. What sense is there in believing that snakes will not crawl over an ash stick, or ants cross a white chalk mark or a ring of salt, when it is so easy to prove that such statements are fallacious? There can certainly be no harm in trying to learn the truth even if you fail, provided no risk is run in making the experiment.

WHAT'S IN A NAME?

A CORRESPONDENT asks:—"When SARAH ELIZA JONES and JOHN SMITH are married what, thereafter, is the proper and legal name of the lady?"

It is always presumed that a woman loses nothing but, on the contrary, gains by marriage. She certainly gains another name. We are not aware at what period in history this custom was introduced, but evidently it was not until after Bible times. It is now universal in Christian lands although, so far as we know, there is nothing in any marriage service, with one exception, relative to it. That exception is the sensible, beautiful and impressive form used by the Society of Friends, or Quakers, in which the woman formally assumes the name of her husband.

When the absurd custom of giving a girl a multiplicity of Christian names has been followed, it is deemed best that she drop, at marriage, all but the one by which she has been generally known. This, with her surname—or more properly sirename—and that of her husband become and are thenceforth her proper and legal name. In the case above named the lady would probably discard ELIZA and add SMITH, writing as her signature, SARAH JONES SMITH.

Women are often known only as the wives of their husbands, having their individuality blotted out at once, and many of SARAH'S friends would be likely, following a custom, to address their letters to her as "Mrs. JOHN SMITH." This should not be done. The Christian name of the husband ought never to be used in connection with the wife except when both are spoken of at the same time; then it may be as "Mr. and Mrs. JOHN SMITH," or "JOHN SMITH and wife," but never as "JOHN SMITH and lady."

We are aware that it has become quite common for married ladies to use their husband's instead of their own Christian name, on their visiting cards and, when so unfortunate as to become widows, to assume their own again; but we could never see any good reason for it unless it was for the purpose of announcing whether or not they were in the matrimonial market. We may be reminded that in society, the Christian name of not one married woman in twenty is known but to her most intimate acquaintances. We admit that is the case, except among the Friends, and answer, More's the pity. When we hear a man spoken of as "Mrs. ROBINSON'S husband," we at once infer that his intellectual status must be considerably below the average if he can shine only by reflected light, and we are at a loss to understand why a woman should not be allowed to stand up on her own merits rather than be spoken of as if she were merely an appendage to a man.

She should retain her Christian name because she has always been known by it, her family name from respect to the family she has or should have left and for convenience of genealogical research, and take the name of her husband's family, of which, henceforth, she is part and parcel; and all people should have sufficient respect for her to recognize the fact that, although by her marriage she became, in the eyes of the law, a thing, she did not entirely surrender her individuality but still remains a person.

RURAL NOTES.

Names of Oranges and Lemons.—It is a lamentable fact that of the thousands of different varieties of the oranges and lemons, which reach our markets or cultivated in different parts of the world, comparatively few have ever been described or given distinct names. Florida oranges, Havana oranges, names which really mean nothing, for the fruit bearing them may have never come from either of the localities named and if they had, it would not convey any idea of their qualities any more than apples from Maine or New York would indicate name or quality of this fruit. The great want of Southern pomology is a good and thorough treatise on nomenclature, something after the style and scope of our Northern standard pomological works. Tropical fruits of all kinds are in a sad state of confusion in regard to names and no real and steady progress can be assured until it is cleared up by a master hand. The extreme Southern States should take this matter in hand and secure the services of some man who is capable of giving to the world an authoritative work on the subject.

Cotton Spinning in the South.—Much as the people of the Southern States neglected home manufactures in days gone by, they have at last waked up to their importance, especially to the using of the raw staples instead of sending them abroad to enrich the capitalists of other localities and countries. This is clearly shown in the spinning of cotton, the great staple of the South, for while in 1869 only 14,561 bales were worked up at home, the number had increased 144,066 in 1875. This is a good showing, although only 3½ per cent. of the cotton raised has been manufactured at home, the remainder having been sent abroad to give employment to foreign capital and labor. Further progress in the way of home manufactures is needed to bring peace and plenty to the South as well as North.

The Dairy Building.—In another column will be found an interesting letter concerning the management of the Dairy Building at the Centennial. Events are rapidly justifying our strictures as editorially expressed a few months since; and while we sincerely deplore a state of affairs so inimical to an important Agricultural industry, we could not logically expect a different result from the practical application of false views and, to express it mildly, careless direction of an important trust.

RURAL BREVITIES.

WE learn that FRED. MATHER, Superintendent of Aquaria, Centennial Exposition, has resigned.

"OUR COUNTRY."—We are obliged to omit the continuation of the Historical article this week—but it may be expected regularly hereafter.

THE Editor of the New England Farmer owns up to having been sold by a tree peddler. He purchased some genuine Versailles currant bushes which, when they came into bearing, produced small, sour, white fruit. We could tell a story twice as good as that played upon us by a nurseryman in good standing not a hundred miles from Boston.

TWO LETTERS.

HIS.

If you were dead and in some silent valley
A red wild rose were blooming on your grave,
In some lone fen where idle breezes dally
And somberly green willow-branches wave:

With willing feet I oft would stand above you,
And with sad eyes your moss-grown name spell out,
Thinking that once each said to each "I love you,"
In those far days before we dared to doubt.

But no, you are not dead; the world adorns you,
Kneels at your feet and calls your face divine;
Praises your beauty, worships till it bores you,
Knows not and cares not that you once were mine.

Edith, I care not that your blood is flowing
In splendid radiant cheek or dainty wrist;
That on your supple throat there still is glowing
A queenly coil of pearl and amethyst;

Our love is dead, so you are dead thrice over,
Though on your face have dropped no mourner's tears;
And you and I, who once were maid and lover,
Are further sundered than the furtherest spheres.

But stars and spheres—
Oh! what a silly letter
A plain and prosy man will sometimes write.
I'm sentimental, and you can't do better
Than laugh at me, once more, with all your might.

The fact, you see, is this: I can't forget you;
In all our quarrel I alone was wrong;
And I've been blue enough since last I met you,
A month ago; it seems ten times as long.

Oh! Edith, could I only go and see you,
And tell you all the things I want to say!
I cannot give you up; I will not free you;
I love you, Edith. May I come to-day?

HERS.

Why, Tom, dear Tom, of course you may—
You see I call you Tom again;
So please come over right away,
You oddest, truest, best of men.

To tell the truth, I've pitied you,
And you've, most likely, pitied me;
But then, you know, it wouldn't do
To let the world my pity see.

You men, of course, are very wise,
And think you know a woman's heart;
But bats and owls have brighter eyes
Than you to understand her art.

You were just hateful, though, that night;
But I'm afraid I made you so;
Tom, drop our quarrel out of sight—
Forgive, forget, and let it go.

Well, Tom, I'll not write any more,
Although, indeed, I've much to say;
My music master's at the door,
So *au revoir*, and come to-day.

P. S.—You frighten me to death
With "willow," "valley," "grave" and "fen.
Dear me! I almost lost my breath!
Tom, don't you *dare* do so again!

[*Chas. F. Richardson.*

CLOUDS.

In some sections of country where rain has been more "honored in the breach than the observance," as it were, it may revivify the memory of the oldest inhabitant—not to speak of the rising generation—to explain what a cloud really is. When at last they do make an appearance, they will be recognized at once.

The clouds illustrated are known scientifically as Fracto-cumulus, and are the forerunners of approaching storms. The artist, I see, has designated the clouds alphabetically thinking, perhaps, that he will entrap me into a scientific explanation, which is quite foreign to my intention.

I wish merely to impress it on my readers that these Fracto-cumulus, as soon as an invisible storm has broken out in the distance move ahead with great rapidity, almost grazing the highest buildings and tallest trees; borders excessively torn; clouds of a whitish color. They are visible day and night. In the Antilles they produce the disagreeable winter rains and in Europe March storms; in this country they produce water in large quantities—in fact, are quite wet, so to speak.

It is not generally known that a cloud was the first umbrella, and came between the Sun and Earth during a heated discussion between these parties, which, of course, resulted in a decided coolness. Their appearance at sea gives the same warning to sailors that a commotion in the nursery gives to mothers—that is, they forebode a *squall*. It is superfluous to state that these clouds are never seen in the Desert of Sahara, and for the last two months in some sections of New Jersey, a race of skeptics has sprung up with mushroom rapidity, who firmly believe there is no such thing as rain clouds; nothing being certain but taxes and the potato beetle.

The Fracto-Cumulus are the only clouds which do not produce halos; but they do produce complete coronas, or segments of arcs, according to the extent of the fragments which traverse the lunar disc. These coronas are prismatic, but having a blue internal tint—a tint analagous to the feelings of the farmer when he sees his corn turning yellow but gazes in vain for a glimpse of the aforesaid "Fracto." I wish at some future time to have illustrated and describe striking snow and ice clouds. They are very beautiful and unique, and including an interesting work on the Polar regions about the most seasonable, cool and altogether delightful reading and pictures that one could have at this season.

FARCEUR.

The Story-Teller.

THE DULL SCHOLAR.

BY IRENE CHILSON.

It was a cheerless morning the first week in May, that I wended my way to the little schoolhouse in N——, which was to be the scene of my labors for the next four months. I always dreaded the first day, and this morning my mind seemed

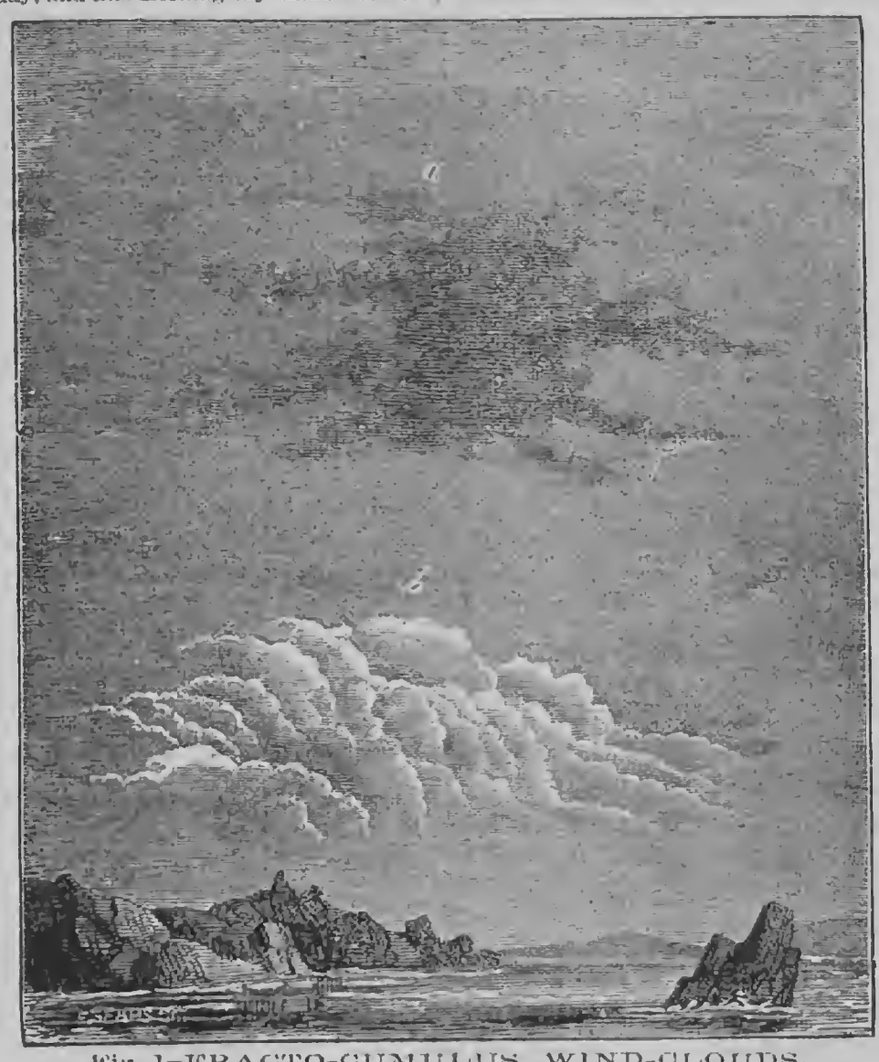

Fig. 1—FRACTO-CUMULUS WIND-CLOUDS.

in keeping with the weather and I could not help wishing that the house would be empty when I arrived. The task would be easier I thought, of meeting and greeting the scholars if I could be there to meet them as they came in singly or in little groups. But no; as I reached the house a chorus of youthful voices reached my ear, and as I lifted the latch and entered, a hush fell over the little circle which surrounded the stove and the whispered murmur, "It is the new teacher—it is the new teacher!" was the only sound which greeted me.

I bowed smilingly to the little group and laying aside my hat and shawl, went up to the stove, in which a bright fire was glowing, and held my fingers for a moment over it.

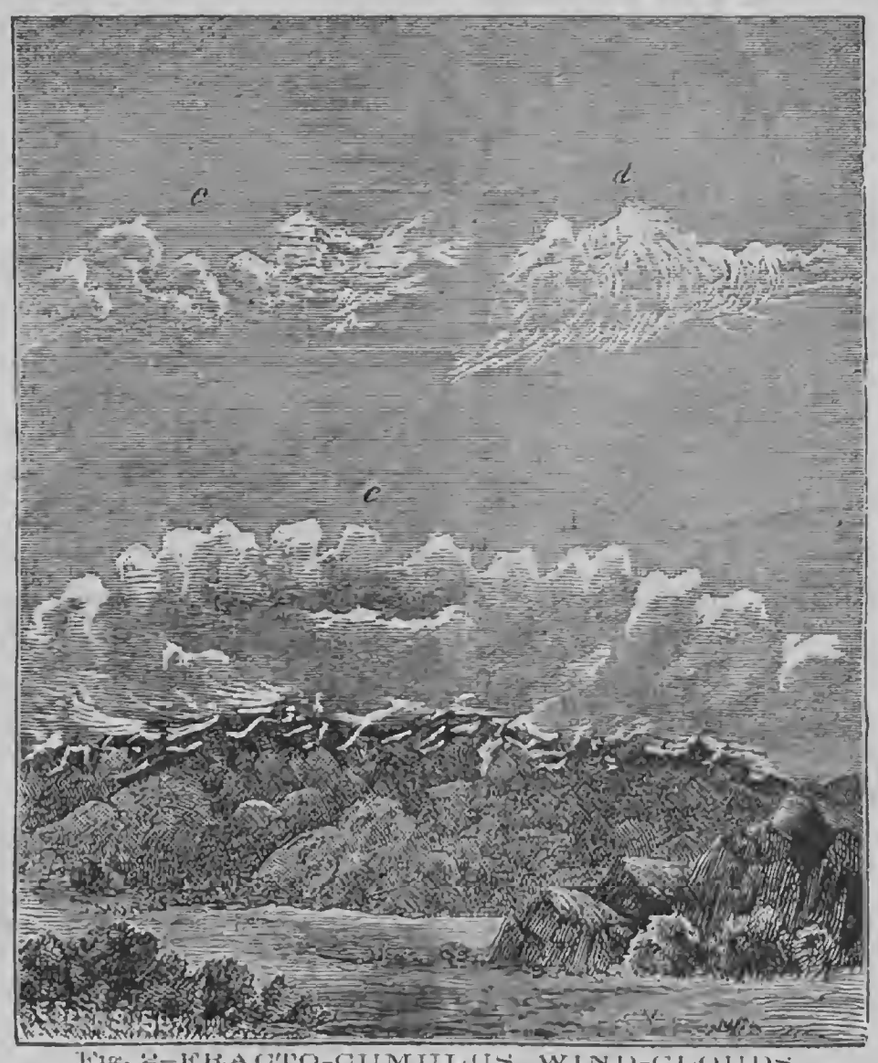

Fig. 2—FRACTO-CUMULUS WIND-CLOUDS.

"This is a very nice fire," I remarked. "I am glad some one has taken the pains to build it."

"CHARLIE built it because he said the new teacher would be cold this chilly morning," said a little bright-eyed boy of six summers, the first who had spoken.

"And who is CHARLIE, that I may thank him?" I asked, laying my hand on the little fellow's head.

"O! it's CHARLIE STEELE. He's gone back home to get his books; he forgot them."

"He always forgets them, he's so dreadful dull," said a little girl who was standing near me.

"Not so very dull is he when he has thought to build such a good fire?" I asked, smiling.

"O, teacher, you can't think how dull he is," said a third voice, which belonged to a curly-headed girl of ten. "He reads in the Second Reader and has to spell out all his words, and he is twelve years old too! O, my! you can't think how dull he is."

"And the more he studies the more he doesn't learn," broke in another childish voice. They were evidently determined to make me understand the hopelessness of the case.

A touch of the bell brought the scholars to their seats, and taking my Bible from my basket I read a short lesson and commenced the exercises of the day.

Half an hour later the door opened and a boy, whom I took at once to be CHARLIE STEELE, entered, and swaggering across the room, took his seat. A suppressed titter ran around the room and knowing glances met mine, which seemed to say, "This is he, this is CHARLIE STEELE." And truly, his appearance was anything but prepossessing. His clothes were pitched on awry, his shirt collar unbuttoned, his hair uncombed, his face and hands unwashed. I saw all this at a glance, while I kept on with my instructions to a class of little girls as if there had been no interruption.

When the Second Reader class was called CHARLIE took his place with them. He was much taller and older than any of his class and had an awkward, half-bashful, half-ashamed manner, which seemed to say that he felt degraded in occupying a position in a class so much younger than himself. When he came to read he was much embarrassed and cast furtive glances and made a dodging motion as if he expected to be beaten, which pained me exceedingly.

His spelling was no better than his reading. He missed nearly every word and the two studies were all he pursued.

"Did you ever study Mental Arithmetic, CHARLIE?" I asked.

"No, ma'am; I haint no book."

"Mother thinks he ought not to study it till he has learned to read and spell better," his sister explained.

By this time I had learned that two neatly-dressed, bright-looking girls, one older and one younger than himself, were his sisters; and a little boy of eight years, who could read readily in the Third Reader, was his brother.

The third day at noon, I sat down to ponder what was to be done with my dull scholar. It did not seem to me so much dullness, but I could not make out what it was. He had a sullen, dogged expression of countenance, which I thought might be the result of the treatment he received—for it was evident enough that the scholars (his brothers and sisters not excepted) all thought him but a little removed from an idiot. I resolved to go home with him that very night and study the case there. While I was musing the door opened and CHARLIE entered and advancing to the window, looked sullenly out.

"Why are you not playing with the rest of the scholars, CHARLIE?" I asked.

"They don't want me with them," he replied.

"And why not, pray?"

"I expect it is because I'm so dull," he answered.

"You are not really dull, are you, CHARLIE?" I asked, as I came to his side and placed my hand upon his head.

"That's what they all say."

"All who?"

"The scholars and everybody."

"But you don't mean to be dull?"

"I can't help it. I'd give anything, Miss TRACY, if I was like the other boys, but I ain't and never shall be. Nobody likes me and if I tried ever so hard to learn and to be good, they'd just laugh at me and knock me round, and call me a booby and all sorts of names, and it's no use trying," and he burst into tears.

I was encouraged. "There is some good in him, after all," I said to myself, "and I'll see if it cannot be brought out."

"CHARLIE," I said, kindly, "I know you can become a different boy, and if you will try I'll help you."

"But do you really think that I could, Miss TRACY?"

"I'm sure of it. We will see what can be done, anyway. I am going home with you to-night and we will talk about it, but it is school time now."

During the afternoon exercises I often encountered CHARLIE'S eyes fixed upon me with a wistful, imploring look. It was evident that he was unused to kindly words and I took courage. But, though he seemed to study hard, his reading and spelling were not much improved.

I went to Mr. STEELE'S that night and was very kindly met and treated. I soon saw that my dull boy was treated as an inferior, both by parents and children. That he *was* inferior in many respects to the other children, I did not doubt; but why that inferiority, if it existed, should be increased by injudicious treatment, I could not understand. Not that he was treated unkindly or with harshness, but he was kept in the background and if he chanced to speak, which was seldom, it was painfully evident that the other members of the family were mortified. And in truth his words and manners were awkward enough, even more so than at school. If he moved, some unlucky stool or chair was sure to be upset, as if by magic. If, at the table, he reached his plate to be helped, over would go some unfortunate cup of tea or glass of water, greatly to the annoyance of the mother, who was constantly reminding him to be careful.

In the evening Mr. STEELE remarked, "I am afraid, Miss TRACY, that you will have a task with our CHARLIE here."

"I do not think that there is anything bad or vicious about the boy," I replied.

"O, no; nothing of the kind; but he is so excessively dull. No one has ever yet been able to teach him anything. The rest of the children learn easily. Why, little FREDDIE here, as you must know, is a much better scholar; but CHARLIE never seems to make the least advancement, though he has been kept steadily in school ever since he was four years old."

"Perhaps you sent him to school too young. Many people think it an injury, instead of a benefit, to put children in school at such a tender age," I ventured to say.

"Not younger than the rest," he replied; "but he seems to have no faculty for learning. I should have withdrawn him from school and set him to work, were he good for anything in that line; but he dislikes work as much as he does study."

All this was said in the presence of the child, as well as in the presence of the whole family. Presently I stole a glance at CHARLIE, who was sitting uneasily in his chair at a little distance from me, and the look of utter discouragement that rested upon the face of the neglected boy awoke all my sympathy and sent the hot blood surging to my temples, and I longed to take him by the hand and comfort him.

I had found the key to the whole mystery. If the parents looked upon the child as a subordinate and treated him as such, the children would, as a matter of course and, as a consequence, others would do the same; and it was not to be expected that teachers would interest themselves in such a neglected specimen of humanity unless,

indeed, they were actuated by a broader sense of duty than many of them seem to be. Poor fellow! how my heart pitied him.

That night I prayed long and earnestly that I might have wisdom to discern and understand the way in which to lead the youthful footsteps of my pupil, and that I might have the love and patience and perseverance requisite to my task; and before I slept I felt that my prayer would be answered.

I had no opportunity to speak again with CHARLIE till the next noon. It was a bright, sunny day, and as soon as the scholars had eaten their dinners they were off to the woods to gather wild flowers. When they were gone CHARLIE came to my side with a most dejected, woe-begone expression of countenance.

"What is it, CHARLIE?" I asked cheerfully.

"O, Miss TRACY," he began, "you said yesterday that you thought I might become a different boy, but I guess you don't think so now."

"Indeed I do," I replied with warmth. "I am more than ever convinced of it. I never yet knew a boy by the name of CHARLIE but could be made something of, and I know you are not an exception. Now, if you will try very hard, I think that in a month's time, were I to introduce you to CHARLIE STEELE, you would scarcely know the boy."

He smiled faintly and said:—"I don't see as there is much chance for a fellow. Everybody hates me and kicks me around. It is the first time I have ever been in school three days without having had a dozen whippings. Everybody thinks me such a dunce that I'm sure there is no use trying."

"Not everybody, CHARLIE. Whatever anyone else may say or think, I don't believe a word of it. Why, only think! some of the very best and smartest men we have were at your age as backward and awkward as you are. Why, it really seems to me as if I could look away into the future and see Mr. CHARLES STEELE occupying a position of honor and usefulness among his fellow men that any man might be proud of. Now will you not try for this?"

I noticed that his eye brightened while I was speaking, but his voice trembled as he said:

"I wish father and mother thought as you do, Miss TRACY. There would be some use in trying, then."

"Never mind, CHARLIE. They will come to think as I do before this term closes if you really try to improve. Now, will you consent to do just as I direct?"

"I would do anything to please you, Miss TRACY; you are the only friend I have."

"O! but you must not give way to such thoughts. You must not think anything about what people think of you till you have learned to command their respect. It may take some time, but if you are patient and persevering, I know that you will succeed at last. Now, in the first place, I want you to come here to-morrow morning with your face and hands as clean as soap and water can make them—with your hair neatly brushed, your shoes blacked and your clothes tidily put on, and be sure you are in the school-room five minutes before nine o'clock. Will you, CHARLIE?"

"Yes ma'am, I will. I can do all that just as well as not."

"Well, that will do for the first lesson. We will see how well you accomplish it," I said, looking at my watch and proceeding to ring the bell; but CHARLIE lingered by my side as though he wished to speak.

"Do you want anything?" I asked.

"Miss TRACY, would you just as lief that I read alone?" he asked timidly. "The class all laugh at me so when I make mistakes."

"We will see," I replied.

When it was time for the second class, I took a book from my basket, saying, "I have a new lesson book in which I would like CHARLIE STEELE to read, but in that case it would be necessary that he read alone. Would you be willing to gratify me, CHARLIE?"

"Yes, ma'am," he replied, with an appreciative smile.

"I'm awful glad, Miss TRACY," said little six-year-old MARY WELLS, "'cause he reads so slow and keeps us waiting."

"Well, never mind, MARY; you ought not to speak out in school unless you are spoken to."

The next morning CHARLIE was at the school-house before me and the change in his appearance was really surprising. He was neatly and cleanly attired, and much of the dull, listless expression had gone out of his face and in its stead I could plainly see that a spirit of interest was awakened.

"Well done, CHARLIE!" I said; "this is a good beginning. Now get your Speller and let me give you a lesson for the day before the other scholars arrive. The lesson is long, but it is not very hard Will you try to master it?"

"I will try hard, Miss TRACY," and he did. He scarcely took his eyes off the book the whole morning, and when his class was called upon to spell he only missed one word. I then gave him short lessons in Orthography, and at the end of the first month he had mastered the numbers, abbreviations, and in the multiplication table. And in all that time he had never once been late at school or untidy in his appearance; and more than that, he had gained confidence in himself and won the respect of his school-fellows.

That night he lingered after the rest of the scholars had retired, to ask:—"Don't you think, Miss TRACY, that I might learn to write?"

"Wait a moment," I said; and going to my desk I penned a little note to his mother, requesting that CHARLIE be furnished with a mental arithmetic and writing materials.

They came promptly; and I stayed half an hour every night after the school was dismissed, to teach him how to use them. When once he got started he advanced rapidly—more rapidly than any scholar in school; and at the end of the second month a Geography was added to his list of books. This he studied at home and came every morning prepared with his recitation.

"Why, Miss TRACY," his father said to me one day, "by some process or other you have converted our dull boy into a bookworm. The transformation is really wonderful."

Well, the time came at last for school to close. I think I never enjoyed a term as I did that. I had worked hard and was rewarded with a sweet consciousness that my labors had been attended with success. It was with real regret that I parted with my pupils, and especially with CHARLIE; but he promised me that he would never relapse into his former listlessness.

"There will be no need, Miss TRACY, for nobody laughs at me now, and it is much easier to learn than I supposed. It was all because I had got discouraged and didn't try."

Soon after I left N—— I removed with my parents to another part of the State. That was eighteen years ago. Last month I was spending a week with an old friend in the town of B——. One day a little girl of my hostess was ill and a physician was called. I happened to be in the room when he came. After a little time he addressed me with:

"Pardon me, madam, but may I inquire if your name is EVELYN TRACY?"

"That was my name formerly," I replied, "but I do not recollect having met with you before."

"My name is CHARLES STEELE," he replied, rising and taking my hand.

"What! not little CHARLIE STEELE that used to be one of my pupils in N——?"

"The very same—your dull CHARLIE," he replied.

"This is really a pleasant meeting," I said, as soon as I had recovered from my surprise sufficiently to speak. "I had not expected such a pleasure. I have never heard a syllable from you since I left N——."

"Well, if you will accept an invitation to tea this afternoon, I will drive over for you. My wife will be very happy to entertain you, and we will have an opportunity to talk over old times."

"With the greatest pleasure," I replied.

When he was gone I inquired of my hostess what she knew of my friend, and she informed me that he had commenced practice in the town six years before and had been as a physician eminently successful, but of his former life she knew nothing; and I, in turn, related to her the story which I have just repeated to my readers.

The carriage came in the afternoon and in a few moments I was set down at the door of a neat and tasteful cottage just in the outskirts of the town.

"I would not have my residence in the busy part of the town," said the doctor, "because I wished my family to enjoy the luxuries of the sunshine and pure air."

"This is a most delightful place," I said, "and every way preferable to a residence in the heart of the town."

At the door a sweet-faced lady met me, whom the doctor introduced as his wife. She led me into the parlor, saying:—"I am most happy to meet the lady to whom the doctor says he owes all his success in life."

"I am afraid he gives me more credit than I deserve," I replied.

"Where are the children?" inquired the doctor, when he came in a moment later.

"They are up stairs; I will bring them down," said the lady, as she left the room. In a moment she returned with two beautiful children. The doctor arose and leading them to me, placed the hand of the eldest in mine, saying:

"This is EVELYN TRACY STEELE and this is CHARLIE. May he never be as dull as was his father."

"The doctor will insist that he was the dullest of boys. It isn't true, is it, Mrs. WALTON?" asked Mrs. STEELE.

"He knows I never thought him dull," I replied.

"Do you remember, Miss TRACY—Mrs. WALTON, I mean—of once telling me that it seemed as if you could look away into the future and see me occupying a position of honor and usefulness in the world?" asked the doctor.

"I do not remember," I said, "but I must have been blessed for a moment with a prophet's ken."

"Well, that prophecy, or whatever it was, has been the making of me. I have kept it before my mind through all my years of study and preparation. It has been an incentive to me in many an hour of darkness and discouragement, and I have always lived in hopes that I should one day have the privilege of thanking you for those months of unwearied labor which you bestowed upon me when every one else thought me an irreclaimable blockhead."

We spent a few hours most delightfully; and when, in the evening, I returned to the home of my hostess, I felt as if I had not lived wholly in vain—as if my feeble labors had been, in one instance at least, crowned with success and blessing.

I have penned this little story, hoping that the eye of some overworked teacher, who is discouraged with the dullness of her scholars, should chance to light upon it, she may find in it an incentive to perseverance in her labors, with the hope that the reward so grateful to the toiler may come at last. Or, if some boy or girl who is not remarkable for the quickness of perception, should chance to read it or hear it read, they too might be encouraged to struggle onward and upward, step by step, till their weary feet should overcome every obstacle and difficulty in the way that lead to honor, usefulness and happiness.

A MARVEL OF LITTLENESS.

An incident happened in Machinery Hall, recently, which is well worthy of recording, as it exhibits the unparalleled advancement of American genius in small as well as in great things. While a large throng of visitors from all countries were standing silently around the mighty Corliss engine, watching its gigantic movements with feelings partly of delight and partly of awe, a tall, gentlemanly-looking personage, who afterward gave his name and address as Levi Taylor of Indianola, Iowa, joined the crowd and with the others paid unspoken, yet eloquent homage, to the wondrous monster before him. After watching the motions for a few moments the gentleman passed around to one side and extracting from his pocket a small tin case took from it what looked like a diminutive alcoholic lamp and, striking a match, started a miniature flame and placed the contrivance on the corner of a platform which surrounds the mighty steam giant from Rhode Island. At first glance nothing could be discerned over this lamp but a small excrescence which looked more like a very juvenile humming bird than anything else; but a close inspection showed that what was mistaken for lilliputian wings was the fly-wheel of a perfect steam engine, and persons with extra good eyes could, after a close examination, discover some of the other parts of the curious piece of mechanism. This engine has for its foundation a twenty-five cent gold piece, and many of its parts are so tiny that they cannot be seen without a magnifying glass. It has the regular steam gauge and, though complete in every particular, the entire apparatus weighs only seven grains, while the engine proper weighs but three grains. It is made of gold, steel and platinum. The fly-wheel is only three-quarters of an inch in diameter; the stroke is one-twenty-fourth of an inch and the cut-off one-sixty-fourth of an inch. The machinery, which can all be taken apart, was packed in films of silk. It is to be hoped that this wonderful piece of work may be placed on exhibition alongside of its grand antithesis, but it is now probably too late to make an entry.—*Philadelphia Press.*

CITY OF BAGDAD.

DR. NEWMAN, in his "Babylon and Nineveh," just published by the Harpers, after a fine description of the old city of Bagdad, says:—"The only article imported from the United States and sold in the bazaar of Bagdad is petroleum. It is entered at the port of Alexandria, on the Mediterranean, and transported a thousand miles on the backs of camels. It is one of the marvels of this marvelous age that our petroleum is everywhere to be found in the Levant and the Orient. It lights the dwellings, the temples and mosques amidst the ruins of ancient Babylon and Nineveh. It is the light of Bagdad, the city of the 'Thousand and One Nights;' of Orfah, the birthplace of Abraham; of Marden, the *Mactus* of the Romans; and of Damascus, the 'Gem of the Orient.' It burns in the Grotto of the Nativity of Bethlehem, in the church of the Holy Sepulchre in Jerusalem, amidst the pyramids of Egypt, on the Acropolis of Athens, on the plains of Troy, and in cottage and palace on the banks of the Bosphorus and the Golden Horn." Dr. Newman proceeds to indicate how the consumption of our product might be greatly enlarged in Persia and the surrounding countries. He says, "It is the opinion of good judges that a lucrative trade might be established between the United States and the port of Bagdad via the Persian Gulf. Were the price lessened by a cheaper transportation, American petroleum would find a ready market in the towns on the Persian frontier, and would thence be carried to the villages and cities in the interior of the empire. It would be in general demand in the towns on the Tigris and Euphrates, and the quantity consumed in Bagdad and the adjacent country would be incalculably increased."

CHINESE WATER CLOCKS.

THE Chinese appreciate foreign watches very much and are especially fond of looking at their works; but though they are in some parts very skillful in imitating many European appliances, we do not think that they have yet succeeded in manufacturing watches for themselves, at any rate not to any extent; and during a residence of several years in various parts of the country, we never met with a single specimen, though we have often found Chinamen quite capable of repairing foreign watches. The native methods of telling the time are the clepsydra, incense stick and sun-dial. With regard to the first-named, Dr. Bridgman tells us that in the south of China it is formed of six water pots arranged in successive order, one above another, and from which, through small perforations, the water gradually drops; the lowest vessel of all, which receives the water, has a wooden cover with a hole cut in it; in this hole an index is inserted, on which are marked "periods" of time. Then, as the water in the vessel fills one degree, the index floating on its surface rises one quarter. The periods of time (shih chen) into which the Chinese divide the day and the watches of the night are all indicated by this means. These water clocks seem to have varied in construction at different times; the water pots were originally made of brass but are now wooden.

IT is difficult to explain some of the great problems of nature. It is estimated that it takes eighteen centuries to form a foot of coal, but it is a well-known fact that a ton left out on the sidewalk will usually shrink fifty per cent. or more in a single night.—*Norwich Bulletin.*

Sabbath Reading.

OUR MINISTER'S SERMON.

THE minister said last night, says he,
"Don't be afraid of givin';
If your life ain't worth nothin' to other folks,
Why, what's the use of livin'?"
And that's what I say to my wife, says I,
There's Brown, the mis'rable sinner.
He'd sooner a beggar would starve than give
A cent towards buying a dinner.

I tell you our minister is prime, he is,
But I couldn't quite determine,
When I heard him a givin' it right and left,
Just who was hit by his sermon.
Of course there couldn't be no mistake
When he talked of long-winded prayin',
For Peters and Johnson they sat and scowled
At every word he was sayin'.

And the minister he went on to say,
There's various kinds of cheatin',
And religion's as good for every day
As it is to bring to meetin'.
I don't think much of the man that gives
The loud amens at my preachin',
And spends his time the followin' week
In cheatin' and overreachin'.

I guess that dose was bitter enough
For a man like Jones to swallow:
But I noticed he didn't open his mouth,
Not once, after that, to holler;
Hurrah, says I for the minister—
Of course I said it quiet—
Give us some more of this open talk,
It's very refreshin' diet.

The minister hit 'em every time,
And when he spoke of fashion,
And riggin's out in bows and things,
As woman's ruilin' passion,
And coming to church to see the styles,
I couldn't help a-winkin'
And a-nudgin' my wife, and says I, "That's you,"
And I guess it set her thinkin'.

Says I to myself that sermon's pat,
But man is a queer creation,
And I'm mneh afraid that most of the folks
Won't take the application.
Now, if he had said a word about
My personal mode of sinnin',
I'd have gone to work to right myself,
And not set there a-grinnin'.

Just then the minister says, says he,
"And now I've come to the fellers
Who've lost this shower by usin' their friends
As a sort o' moral umbrellas;
Go home," says he, "and find your faults,
Instead of huntin' your brothers',
Go home," says he, "and wear the coats
You tried to fit for others."

My wife she nudged, and Brown he winked,
And there was lots o' smilin',
And lots o' lookin' at our pew,
It sot my blood a-boilin'.
Says I to myself, our minister
Is gettin' a little bitter,
I'll tell him, when the meetin's out, that I
Ain't at all that kind of a critter.

[*New Haven Register.*

BIBLE NAMES.

IN the old times people called a pearl a "margaret." In an old Bible I once read about the pearl of great price, but it was called a "precious margaret." I read this to a little girl named Margaret, and she was very happy to find her name in the Bible. All the Marys and Marthas and Ruths and Abigails and Graces and Charitys can find their names in the Bible, you know.

There was once a dear girl named Griselda, who had many things to do for her mother. People called her "patient Griselda," and she was pleased to find a story with that very name in an old book. My name is not in the Bible. I wish it were. The names of my three little girls are there; but there is a better place than the Bible in which to have your name written. It is the Lamb's Book of Life. You may read about it in the Revelation.—*Apples of Gold.*

GOLDEN THOUGHTS.

SIN forgiven is peace restored.

HE is a great orator who persuades himself to do that which he ought to do.

IT is backward and downward with the wicked—it is onward and upward with the righteous.

WE cannot be too thankful even for small mercies, but we may be too troubled about small miseries.

IF there be any good in thee, believe that there is much more in others. It hurteth thee most of all to prefer thyself even to one.

I FEAR that I adore His comforts more than Himself, and that I love the apple of life more than the tree of life.—*Rutherford.*

YOU love Christ, and your love draws you after him, away from sin, upwards and along the mountain track of purity and duty.—*Dr. Budington.*

To individual faithfulness, and to the energy of the private conscience, God has committed the real history and progress of mankind.—*James Martineau.*

IF it is winter in our souls, it is because we have turned away from God and His love. If it is night it is not because God has gone away from us, but because we have gone away from Him.

WHEN the sun of the believer's hopes, according to common calculations, is set, to the eye of faith it is still visible. When much of the rest of the world is in darkness, the high ground of faith is illuminated with the brightness of religious consolations.—*Buckminster.*

Ladies' Portfolio.

ONLY GOING TO THE GATE.

Like a bell of blossom ringing,
Clear and childish, shrill and sweet,
Floating to the porch's shadow,
With the faluter fall of feet,
Comes the answer softly backward,
Bidding tender watcher wait,
While the Baby Queen outruns her,
"Only going to the gate."

Through the moonlight, warm and scented,
Love to beauty breathes his sigh,
Lingering, to leave reluctant,
Loth to speak the low good-by;
Then the same low echo answers,
Waiting love of older date,
And the maiden whispers backward,
"Only going to the gate."

Oh, these gates along our pathway,
What they bar outside and in!
With the vague outlook beyond them,
Over ways we have not been.
How they stand before, behind us;
Toll gates some, with price to pay;
Spring gates some, that shut forever;
Cloud gates some that melt away!

Just across their slender weavings
Troth-plight happy hands have crossed:
Yet its locks have rusted ruddy,
Or its key in night-shade lost.
Over latches softly falling,
Good-by prayers have dropped like dew;
Little gateways, softly shutting,
Yet have cut a love in two.

So we pass them going upward
On our journey, one by one,
To the distant shining wicket
Where each traveler goes alone;
Where the friends who journey with us
Strangely falter, stop and wait;
Father, mother, child or lover,
"Only going to the gate." *Ethel Lynn.*

ENJOY WHAT YOU HAVE.

"O DEAR! the *times!* these *dreadful* times! Why, mother, am I *never* to have another new book, or another picture in my room? Those FOSTER girls might have their Cashmere laces and four-buttoned gloves in welcome, if I could only have the new books."

"ELSIE, my child, these *are* dreadful times, but there's a *lesson* in them."

"I have all the lessons *I* want to learn in school."

"I hope the lessons you learn at school will so discipline and strengthen your mind that you will be able to learn *Life's* lessons more easily. The one great lesson I wish you to learn *now* is this: Enjoy what you have. What a fund of entertainment in the Stereoscope—how varied and suggestive are the pictures. With the aid of the Encyclopædia, your History and your Geography too, what wonderful things would be brought to view. It would prove a never-failing source of delight and enjoyment. You have only to go to the parlor table this evening to see the magnificent scenery gas-lighted and foreign lands, all illuminated by

"There, too, are
the well-filled shelves and
ered through the house. I think you'll see many there that you had forgotten were in the library. My daughter, your mind would grow nobler, did it come in contact oftener with the thoughts of those gifted authors (both men and women) of the past, as well as the present time.

"ELISE, why not, in this Centennial year, read IRVING'S Washington? After reading a few such books, I think you would cease sighing for every new novel. One, occasionally, mixed with such reading, could not harm you, but would serve as recreation. But Retrench is the order of the day, and we can retrench in novels better than other things. We will be thankful if our *daily wants* be supplied, and doubly grateful if we may retain what we have.

"Now see how much of this lesson you can learn during your vacation. Once learned, it is for a lifetime. Very many are bearing heavy burdens just now, and ours, by no means, is a light one; but we will try to face the times with a cheerful, Christian courage, and so outride the storm. Indeed, 'the land mourneth,' but our country is a vineyard of God's own planting, and He will not overthrow the work of His hands."

W.

GRACE AND GRAMMAR.

WHEN one reads of ancient Athens and how its young people were first sent to study grammar under competent masters, to the end that Athenian youth might attain a thorough knowledge of "the whole beauty, energy, number and cadence" of their language, and as a result, how general became the culture and fine taste of the people, so that even a shepherd woman took one Theophrastus to task for the mispronunciation of a single word, one can hardly suppress a fit of psychic squeamishness at thoughts of our modern, slipshod, down-at-the-heel, out-at-the-elbow style of dressing up our ideas. Double negatives, disagreement of cases, singulars for plurals, adjectives for adverbs, rough-and-tumble treatment of final consonants, hammering out "n" into "oo," flattening "a" into "e," *et id omne genus*. Now, it may be asked, if an angel were to alight in your pathway and offer to bless you, would you insist upon having the benison in good English? Probably not. Angels' visits are confessedly, few and far between.

But the young ladies, those seraphim of the earthly type, are always with us. They sit near us in the theaters, beside us in the stages, around us at the concerts. They grace the salon, they piece out with bright colors the home circle and family gathering.

They're not silent monitors. On the contrary, out of the abundance of their hearts come many and wonderful things. "In her tongue is the law of kindness," and "her lips drop sweet smelling myrrh."

But what of all that if she says "Good mornin'" and "Good evenin'?"

Suppose she come, like Queen Sheba, "with a very great train," and fail to put objectives after her prepositions, will it not mar the glory of her coming?

Seriously, should a woman be called "graceful" who continually stumbles over her final consonants and says "Lemme go," "a good 'cal," "firs'-rate," "han' me that blottin' paper?"

It's a pleasant thing to hear from the lips of Araminta—your heart's own delight—that she resolutely declined young Phipkins's invitation to the theater, but when the artless maid half closes her eyes and murmurs, "If he'd came for me in a golden chariot I wouldn't have went!" you don't feel so comfortable, so negligently at ease, as you were before that last remark of Araminta's.

Women should not deceive themselves. The most uncouth, illiterate man knows what elegant and correct English is, *when he hears it*. He may not be able to string three words correctly himself; but he sniffs the harmony of a rounded sentence from afar. It is instinctive. See how workingmen hang upon the lips of an orator! Of his meaning they know little or nothing, but the "energy, number and cadence" they catch.

FOR AND ABOUT WOMEN.

IN Queen Elizabeth's time a journeyman mason was paid only five shillings and sixpence a week, and he didn't go about airing his financial views, either.

"WHY is it," queried Quiz the other day, "that when you notice a young married man who is bald-headed, you turn to look at the muscular power of his wife's hands?"

THE Bengal Government has appointed a native lady inspector of the female schools in Calcutta. She is the daughter of a Bengalee clergyman. This is the first instance of any appointment of the kind.

MARRIED women generally get their letters when the time comes to pack away their husbands' overcoats for the summer, and perhaps they will also find two or three which the gentleman had been asked to mail the fall previous.

"YES, madam," he remarked, "woman's place is her home, amid her children and her household duties, while the father toils for bread," and then he picked up a bat and thought he'd go over for an hour or so and see what was going on at the base ball ground.

Two ladies were admitted this year to the class in Roman law at the University College, London, and at a late examination one of them stood first and the other third in the class. The first mentioned had already distinguished herself in political economy and jurisprudence.

THEY were discussing a young girl whose beauty makes her a social sensation, but who, whether son, sees fit, lacks a fortune or for some other reason. "She makes all visitors declare himself formsaid one. "True," said another, "she gets the guests she desires," "but she would give all her slaves for one woman, ter."

Two ladies, desirous of asserting the rights of their sex, astonished the citizens of Freyburg, Me., a few days ago, by appearing with hoes in their hands and insisting on commuting a highway tax, for which they had been assessed, by working on the highways, which is one of the privileges of the male taxpayer in some towns in Maine.

THEY have erected a monument to Moll Pitcher down in Pennsylvania—to "Captain" Moll Pitcher, who swore big, masculine oaths and fought like a whole regiment of Hessians. And what think you? In enduring letters chiseled into the marble this gentle, soft, timid creature blushes and shrinks from the gaze of the nineteenth century as Mollie!

How doth the little busy B.
(By B. I mean a Belle,)
Improve each shining hair to see
If she can't catch a swell!

How skillfully she plaits each tress,
How neatly folds her pads,
And lets a curl flow down her back
To tempt us artless lads! *[Judy.*

THEY had a good deal of trouble with the Aztec woman attached to Barnum's circus in Providence. It seems she wanted her salary raised to $7 a week, but they told her if they did she would also be obliged to appear as the Siberian malefactor, and she said she would go back to Limerick first and take in washing again at two shillings a day, and they were obliged to compromise by bringing her out as the fascinating Odalisque of the Orient.

TALK about conceit as much as you like, it is to human character what salt is to the ocean; it keeps it sweet and renders it endurable. Say rather, it is like the natural unguent of the seafowl's plumage, which enables him to shed the rain that falls on him and the wave in which he dips. When one has had all his conceit taken out of him, when he has lost all his illusions, his feathers will soon soak through, and he will fly no more.—*Holmes.*

Reading for the Young.

PUNKYDOODLE AND JOLLAPIN.

Oh, Pillykin Willykin Winky Woe!
How does the Emperor take his tea?
He takes it with melons, he takes it with milk,
He takes it with sirup and sassafras silk.
He takes it without, he takes it within;
Oh, Punkydoodle and Jollapin!

Oh, Pillykin Willykin Winky Woe!
How does the Cardinal take his tea?
He takes it in Latin, he takes it in Greek,
He takes it just seventy times a week,
He takes it so strong that it makes him grin;
Oh, Punkydoodle and Jollapin!

Oh, Pillykin Willykin Winky Woe!
How does the Admiral take his tea?
He takes it with spilicer, he takes it with spars,
He takes it with jokers and jolly jack-tars:
And he stirs it round with a dolphin's fin;
Oh, Punkydoodle and Jollapin!

Oh, Pillykin Willykin Winky Woe!
How does the President take his tea?
He takes it in bed, he takes it in school,
He takes it in Congress against the rule,
He takes it with brandy and thinks it no sin;
Oh, Punkydoodle and Jollapin!

[Laura E. Richards, in St. Nicholas for Aug.

RUNNING IN DEBT.

I DWELL on this point, for I would deter others from entering that place of torment. Half the young men in this country, with many old enough to know better, would go into business—that is, into debt—to-morrow, if they could. Most poor men are so ignorant as to envy the merchant or manufacturer, whose life is an incessant struggle with pecuniary difficulties, who is driven to constant "shinning," and who, from month to month, barely evades the insolvency which sooner or later overtakes most men in business; so that it has been computed that but one man in twenty of them achieve a pecuniary success. For my own part I would rather be a convict in the State prison, a slave in a rice swamp, than to pass through life under the harrow of debt. Let no young man misjudge himself unfortunate, or truly poor, so long as he has the full use of his limbs and faculties, and is substantially free from debt. Hunger, cold, rags, hard work, contempt, suspicion, unjust reproach, are disagreeable, but debt is infinitely worse than them all. And if it had pleased God to spare either or all my sons to be the support of my declining years, the lesson which I should most earnestly seek to impress upon them is, "never run in debt." Avoid pecuniary obligations as you would pestilence or famine. If you have but fifty cents and can get no more for a week, buy a peck of corn, parch it and live on it, rather than owe a dollar! Of course I know that some men must do business that involves a risk, and must give notes or other obligations, and I do not consider him in debt who can lay his hands directly on the means of paying, at some little sacrifice, all he owes; I speak of real debt—that which involves risk or sacrifice on one side, obligation and dependence on the other—and I say from all such, let every youth humbly pray God to preserve him evermore.—*Horace Greeley.*

A TRUE STORY OF A DOG.

LONG ago, in a house in a far-off town, which an iron-handed industry has since made all her own, becoming the once pleasant fields, thickening the clear streams and driving the birds who sang by it and the woods which sheltered them further and further back, while she grinds and clangs away incessantly to the tune of pounds, shillings and pence, a little child was one day left unknowingly to her own devices. Her mother and the two handmaids who formed that small household were intent on some domestic business and thought her safely bestowed. This little maid, however, in the meantime determined on improving her acquaintance with the fire—that charming and wonderful element which sent out such pleasant warmth and cheery light in the winter evenings, and made such fantastic shapes to please her in its dying embers, that, warned against it though she was, it could not surely but prove a kindly playmate. The brilliant, treacherous flames soon took advantage of her innocence, and would have formed for her, as for many other children, a fiery chariot to the heavens,—and what child is not the gainer thereby when life means but the heartache to so many?—when one of those shining guardians to whom children must be especially dear, if only because so like themselves, touched with quick instinct of the danger the dumb beast of another guardian near, faithful though lowly—a large brindled dog, aptly enough named Keeper, and chose him for a messenger. The father of the child, about to leave the house, saw the dog, bounding and panting, rush up to him and away again with little heed, a second time approach, again to be unheeded; but when a third time the excited animal appears, seizes his coat, and tries to tell his trouble,—feeling that something unusual must have happened, the master quickly follows him, to find his little girl on fire, and to extinguish the flames.

That little girl, this long time grown a woman, yet remembers dimly, as she tells the writer of this anecdote, crying over the pain of the daily dressing of her burns, has another dim remembrance of a large dog running at her side, but a lively one of the tradition in her family. What wonder that, with a heart full of compassion to all God's creatures, she has ever felt a special fondness for the race of her preserver, and hailed with gratitude the first efforts to find home and shelter, or, if needs must, a speedy end to pain for those poor waifs and strays who used to be so common in our streets, and whose pleading eyes speak the more because they have no outlet in language, nor, except by such services as that here recorded,—and recorded, let me add, in how many instances elsewhere!—can acknowledge our kindness in more substantial fashion than, as some dog-lover has expressed it, a wag of tail.—*Giovannina, in Animal World.*

LETTERS FROM BOYS AND GIRLS.

From a West Virginia Girl.

MR. EDITOR:—I often see letters from Virginia in your paper, but never saw one from our parts, so I thought I would write. My father until lately has been managing a salt furnace for my grandpa, but has given it up and is now engaged in farming on a small scale. Last year we had the largest and earliest strawberries of anybody near us. Papa takes great delight in exhibiting his fowls to all visitors. He has a large hen-house and some of the finest breeds. Among others are the Gray Dorkings, Black Spanish, White Chinas and Light Brahmas. We have two splendid Alderney cows; from these we make butter and use the cream on the table. Mamma has a fine Calla which has been in bud for nearly two months, but never has openened; on examination we have found that the top of the bud is withering. What is the cause? Is it that the shoots which have sprung up have prevented it from blooming? We were told not to trouble them at all until it had bloomed, and then to separate it.—ANNA R., *Kanawha Salines, West Va.*

From a Vermont Girl.

DEAR COUSINS:—I suppose I may be allowed to use that title with the rest. I already feel quite well acquainted with some of the Cousins, though I have never seen them. I live up among the hills of Vermont, and though rather rough it is very pleasant here. I attended school last term and intend to next. The school house is nearly a mile from here. It is a pleasant walk in summer, but in winter is rather cold. Oh, I nearly forgot to give my age, and that is very essential. I am fourteen; am rather tall and slim; have light brown hair, blue eyes, and skin to correspond with hair. I will not say anything about this letter being too long, for fear of incurring YOUNG TOM'S displeasure. If this does not meet its fate in the waste basket, it will greatly encourage —JENNIE M. A., *N. Pomfret, Vt.*

From a Northern New York Boy.

DEAR UNCLES:—I think the Boys' and Girls' Column was never as good as it is now. I hope you will continue to take charge of it for a long time. Your letters are interesting and instructive, and we like to have you write long ones; so tell the Editor not to be so cross with you. I suppose many of the Cousins will go to the Centennial. I should like to go very much, but cannot. However, we can read about it in Uncle MARK'S letters.—HARRY.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 71 letters:
My 13, 3, 6, 20, 17, 51, 5, 11, 13, 35, 55 is worthy of trust and confidence.
My 71, 59, 28, 22, 26 is the body of a tree.
My 50, 2, 12, 29, 10, 58, 55 is a day of the week.
My 10, 4, 23, 52, 27 is a girl's name.
My 9, 44, 56, 57, 14 is to propose.
My 7, 52, 8, 18 a carpenter's tool.
My 9, 15, 23 is not gay or cheerful.
My 16, 22, 20, 21, 53, 68 is unsound of mind.
My 19, 18, 20, 27 is a flower.
My 30, 33, 34, 45, 36, 19, 30 are welcome visitants to us when far from home.
My 24, 25, 59, 26, 32, 69, 65, 53 is one who is skillful in hitting a mark.
My 20, 28, 66, 35, 68, 69 was a celebrated reformer.
My 32, 31, 2, 3 is not sweet.
My 20, 41, 42, 36, 67 is not sour.
My 36, 22, 12, 46, 55 is one who hates another.
My 37, 38, 39, 40 is a long way from being called bad.
My 70, 47, 48, 68, 64, 22 is a well-known bird.
My 49, 43, 54, 7, 56 is a nag many people are wont to ride.
My 63, 60, 61 is a kind of ware used in all households.
My 62, 58, 54 is to talk idly.
My whole is a true quotation.

☞ Answer in two weeks. B. M. N.

DOUBLE ACROSTIC.

1. A common exclamation. 2. A mason's tool. 3. Part of a ship. 4. A precious stone. 5. A French coin. The initials and finals give the name of an American officer of the Revolutionary War.

☞ Answer in two weeks. ISOLA.

PUZZLER ANSWERS.—July 22.

CROSS-WORD ENIGMA.—Common sense.

HIDDEN RIVERS.—1, Witham; 2, Ouse, Tay; 3, Aire; 4, Beni; 5, Tweed; 6, Derwent, 7, Trent; 8, Thames; 9, Lena; 10, Amoor; 11, Indus.

DOUBLE ACROSTIC.—Initials, Schuyler; finals, Burgoyne.

CROSS-WORD PUZZLE.—Hugh.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of those every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In those matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

THE schools of Milwaukee have cost during the past year $153,000. The salaries of male teachers are $1,100, of females, $500. The cost of instruction per capita is a trifle less than $16.50. The committee on German report that the effort to systematize the study of the German language in the public schools during the past year has been a great success. Acting upon the request of the superintendent of schools, the teachers of German at the beginning of the present school year formed themselves into an association, and, in connection with the committee, drew up a graded course of instruction, which was adopted by the Board at the regular meeting in September last, and went into operation immediately thereafter.

A telegram from Fort Fetterman, Wyoming, July 26, says:—It was Gen. Crook's intention originally to renew operations against the Sioux upon the arrival of the wagon train and additional infantry, but the fatal results attending Gen. Terry's expedition has suggested the propriety of adding the eight companies of the 5th Cavalry under Col. Merritt, at or near Fort Laramie, to this command. The wagons and infantry arrived on the 13th inst., but there are yet no certain tidings of the whereabouts of Col. Merritt, who, on the 16th, went in pursuit of a body of Cheyennes. The weather has been very warm for the past week or ten days, drying up the pasturage very materially. This drawback to the sustenance of the cavalry has been increased by the Indians setting fire to the grass, burning large tracts of it, and rendering camps inconvenient if not dangerous.

It is believed that the main body of the Sioux have left the valleys and foot-hills and taken up more secure positions in the Big Horn Mountains proper, where game is more plentiful and the grazing more fresh. The alternative is therefore forced upon Gen. Crook either to move upon them at once or consider the summer's campaign a desultory and indecisive affair. It is not improbable that the Sioux have resolved to keep to the main chain of mountains, and swing around south toward the head of Powder River, and debouch on the plains toward Fort Fetterman.

Gen. Crook's command consists of 15 companies of cavalry and 19 of infantry, numbering about 1,200 soldiers, a few half-breed scouts and citizen volunteers, and the 200 Snake allies, in all not over 1,400 fighting men. With this force, however, he feels that he can at least hold his own, and, with Gen. Terry's command in reserve, something definite can probably be effected. It is not unlikely, therefore, that this command will march over to the main fork of Tongue River at once, where the wagon train will be put in park. With the pack train carrying from 15 to 20 days' rations, a rapid march toward the enemy will probably be made within a day or two. The Sioux are either scattered already or are in force on the head-waters of the Little Big Horn and Ash Creek, near the Mountain line, not more than 40 miles distant.

The Sioux cannot move their families and effects through the rough mountains as rapidly as the soldiers can follow them, hence they must either make a stand or leave them behind after the fight is under way. The Snake Indian allies are of this way of thinking, and are almost as anxious for an advance as any other portion of this command. The pack train of 380 packs is the best organized affair of the kind on the continent, and is in a condition to follow the enemy over any trail they may select and make a good fight besides, so that the command will be enabled to remain in the rough-est mountains an indefinite period.

It is hoped and expected that a band of Utes and possibly a band of Bannock allies will join the expedition before the next move. These Indian allies, however, are only voluntary aids, and are looking for what plunder they can capture. Owing to their superstitious notions, they are not altogether trustworthy unless success is continuous from the first. Evidently a short time only will elapse before the entire command will be put to the test.

At an early hour on the morning of July 26th, several hundred unemployed workingmen assembled on the esplanade in Fountain-square, Cincinnati. After listening to speeches from Samuel Cary and others upon the deplorable condition of the workingman, &c., they went in procession to the city buildings to demand of the Mayor "bread or blood"—as announced by one of the leaders. Upon the arrival at the building, no one seemed willing to wait upon the Mayor with the demand, and after a half hour's waiting and discussion the crowd was dispersed. The Mayor had been apprised of their coming, and had placed a strong guard of policemen around the buildings.

Sidney A. Berlhoir, aged thirty years, a son of a respectable Orange County farmer, ended a spree at Middletown on the 25th ult. by taking morphine, dying the next morning. He had previously made several attempts at suicide, on one occasion digging his grave.

President Phelps, of the Educational Association, says that the establishment of a great museum is likely to be forced upon this country by the generosity of foreigners in contributing to the educational department of the Exhibition. He mentions Austria and Japan as likely to donate their exhibits for such a purpose, and Dr. Da Motta, who has charge of the Brazilian exhibit, intimates that this will be the probable disposal of it.

John S. Baker of Boston has accepted the nomination for Governor of Massachusetts on the prohibitory ticket.

John and William Young, who were sentenced to be hanged on June 21 for the murder of Abel McDonald, but who on May 28 escaped from Cayuga jail after a murderous attack on the jailer, were discovered the morning of the 26th ult., hiding in a barn, and recaptured. The convicts fired on the police when they appeared. It is reported one of the Youngs was shot through the arm.

A tornado passed over the northern part of the country near St. Louis, Mo., July 29, doing a great deal of damage to outhouses, fences, trees, crops, etc. A little girl named O'Toole was killed.

The terms upon which Prof. Seelye accepts the Presidency of Amherst College are said to be as follows:—He is to have $4,000 salary, without any perquisites; to continue also the duties of Professor of Mental and Moral Philosophy, and to have the liberty to complete his present term in Congress. All of these details are in accordance with his own wishes.

A serious conflagration in Millbury, Mass. has damaged property to the extent of $160,000.

The coal miners of St. Claire and Madison counties, Ill., held a mass meeting in St. Claire County, and resolved that after Aug. 1 they will not mine coal for less than three cents a bushel. As much the largest part of the coal consumed in St. Louis comes from the counties named, the prospect are fair for a coal famine.

The Indian Bureau claims it is not responsible for the distribution of arms and amunition to Sitting Bull.

Gen. Sheridan advises that the cavalry be recruited up to their full strength.

Unfounded reports received at St. Louis state that Gen. Crook has suffered a crushing defeat at the hands of the Indians on Goose Creek.

Runners who have come in to Red Cloud Agency are said to have come from Crazy Horse's band, and state that that Chief, with a portion of his band, had left Sitting Bull's domains and are en route to the agencies, avowedly to treat for peace. The turning over of the agencies at Red Cloud and Spotted Tail has been made without any difficulty.

CHICAGO, July 30.—The committee appointed to investigate the condition of wheat in the elevators report that it is in good condition, except about a dozen bins which contain warm wheat.

Col. Wharton, Gen. Bristow's law partner, has been removed by the President from the office of U. S. District Attorney of Louisville. He was very active in the whisky prosecutions.

A thousand Germans settled in Russia are reported to have emigrated to America last week.

A nickel mine has been found in Seymour, Conn., and the metal is said to be in paying quantities.

The bill to provide for the completion of the Washington Monument, as passed by both houses of Congress, appropriates $200,000 for that purpose, payable in four equal annual installments, and provides that before any portion of the money shall be expended, the Washington National Monument Society shall transfer and convey to the United States all the property, easements, rights and privileges belonging to that corporation.

It also permits that society to continue its organization for the purpose of soliciting and collecting money and material from State associations and the people in aid of the completion of the monument, and acting in an advisory and co-operative capacity with the commission charged with the duty of completing the work, which commission consists of the President of the United States, the Supervising Architect of the Treasury Department, the Architect of the Capitol, the Chief of Engineers of the United States Army, and the Vice-President of the Monument Society.

The Conference Committee on the General Appropriation bill seem to be in no great hurry to report it. They will probably arrange to pay the President's salary to the end of the term, while the salary of the next President will be left an open question. Salaries of Congressmen are to be fixed at $4,800.

It is estimated that there is about $20,000,000 in gold coin in circulation in California now against half that amount at the time of the panic.

FOREIGN NOTES.

IN France, out of a population of 36,000,000, only two million live on the revenue of accumulated wealth, the balance depending on the produce of labor.

In order to secure for themselves a suspension of Sunday labor, a number of the men employed by the Liverpool Omnibus Company have taken out a summons against the manager for breaking the Sabbath day.

The famous city of Sebastopol does not now contain more than nine thousand inhabitants, who vegetate in the midst of crumbled walls, living by a wretched commerce, which hardly brings them in bread.

The tomato, which a few years ago was a fancy article in the London markets, is now in increasing demand, and they are quite common even early in the season. Paris and Lisbon are the chief sources of supply. The climate of England is not suitable for its successful cultivation in the open air.

A Vienna special says it is said that the Turkish Embassador there has confidentially stated that the Porte declares some of the most important of Roumania's demands are inadmissible. He refuses to discuss the cession of the mouth of the Danube, as that question equally concerns the other powers.

A Ragusa special says that a private letter from Mostar announces that the Montenegrins were retiring to their own frontier after attacking Nevesinge.

There is a rumor, says a Vienna special of the London News, that a majority of the Softas and Ulemas have resolved to urge Sultan Murad to resign. Murad and the Ministers have agreed that the resignation shall take place at the close of the Servian war. The Sultan's brother is mentioned as successor.

A Belgrade dispatch says a disguised Turk has been arrested at Gladova. He had several packages of poison on his person, and it is supposed he intended to poison wells in Servia.

A Constantinople correspondent of the Times says considerable excitement prevails in Crete, Greece and Roumania. The Turks are convinced that the war will not be localized, and expect hostilities with Russia.

The Standard's Paris special says the Temps has a dispatch from Vienna stating that the municipal authorities throughout Austria have been instructed to prepare for the mobilization of the army at a moment's notice.

The Times's Berlin special says the Democratic society of Frankfort-on-the-Main presented, on the Fourth of July, an address in honor of the Centennial to the American Consul, strongly reflecting upon monarchical institutions. The Consul refused to accept the address. The Society thereupon complained to the American Minister, Mr. Bancroft Davis, who replied that it was inadmissable for an American representative to meddle with party politics.

The whereabouts of the Prince of Montenegro are unknown. It is believed that the battle a few days since at Banzana, where 5,000 Montenegrins attacked a Turkish post and were repulsed with heavy loss, was fought to cover the withdrawal of the main Montenegrin army.

Twenty-five thousand Roumanians are said to be concentrated on the Danubian frontier. The Turks are guarding the opposite bank. Shots were exchanged before Ostrow. It was reported that a Turkish patrol entered Roumanian territory and pillaged some houses. A conflict is apprehended.

At last accounts, all was quiet on the Timok, but as Abdul Kerim, the Turkish commander-in-chief, has arrived at the seat of war, it is probable hostilities will be promptly resumed on a large scale. The Servians are dispirited, but there is a ray of hope for them in the report that 25,000 Roumanians are concentrated on the Danubian frontier, and that shots have been exchanged with the Turks. Gen. Zach's success is also encouraging, since it is a step toward gaining control of the narrow strip of Bosnian territory lying between Servia and Montenegro. Were this secured by the Servians, the Turks would be cut off from communication with Bosnia.

Telegrams received from Paris July 29, state that numerous partisans of Karageorgewitch have been arrested.

Mr. Pesther Lloyd, the British representative in Servia, is endeavoring to induce Prince Milan to make an offer of reconciliation to the Porte before final operations take place.

The Echo, in its Berlin dispatch, says:—"Prince Nikita intends to resign the chief command of the Montenegrin army."

Slavic advices announce that the Turks are preparing to attack the Montenegrins before Podgoritza, in order to open the road to Niesics through Montenegro.

The Italian Senate, by a vote of 114 to 102, has adopted the bill for establishing free warehouses at seaports. The object of the bill is to establish a system of bonded warehouses, and not as heretofore stated, for allowing the delivery and consumption of goods without payment of duties.

A Rome special says Cardinal Antonelli's life has latterly been in danger from a complication of gout and rheumatism. He is now pronounced out of any immediate peril.

The Government powder magazine at Toulouse, France, has blown up, causing great loss of life.

The Pall Mall Gazette, in an editorial article on the extradition question, says:—We are still of the opinion that the scandal of Winslow's liberation might have been avoided, or the responsibility attaching to England considerably lightened, had a different attitude been assumed at an earlier stage of the proceedings. As far as this case is concerned Lord Granville had the best of the argument, but regarding future cases there is an undoubted force in Lord Derby's plea that as soon as a conflict of views was manifested the extradition arrangement could not be too soon revised.

The article quotes Lord Derby's exposition of the American and English contentions regarding their reciprocal rights and duties under the treaty, and continues:—We should have supposed, to anybody approaching this question with an unbiased judgment, doubt about which theory would be the most rational would be hardly possible. The two simple principles of universal acceptance—one, that civilized nations have a common interest in repressing crime; the other, that men are justifiable according to the procedure of the country of their allegiance and no other—would seem to supply ample material for a decision in favor of the American view. The rival theory appears to us utterly untenable except upon the assumption which has no natural formation in justice or international duty, that a refugee acquires new rights as against the courts of his own country by the mere fact of having escaped from a foreign land. It is as the first public movement toward the overthrow of an exaggerated theory of refugee criminals' rights, which has so strangely grown up of late years, that we welcome the speeches of Earl Kimberley and Earl Grey in Monday's debate.

The Royal Scottish Academy has sustained a loss in the death of Robert Thornburn Ross, who died on July 13 through inflammation of the lungs. He was born in Edinburgh in 1816.

The people of Edinburgh are going to build another memorial to the Prince Consort. Meanwhile, Albert the Gilt continues to be an object of awe and wonder to Hyde Park visitors.

In China the first railroad has been opened for traffic, and is regarded with favor by the people, who enjoyed for one day the American luxury of traveling as "dead-heads." This line, which is only five miles long, connects Shanghai and Kangwan. It was built on the narrow guage system, with British capital, and is finally to extend to Woosung, a further distance of five miles. In time we may expect to hear that the stock of the Nanking and Peking Railroad has been with La Hung and that Prince Kung is constructing Canton and Swatow Chung for the coal new field for American enterprise. As a success of the first line must be deemed gratifying. The Chinese need only a Winans or a Meiggs to establish, soon, a vast railroad system.

The total of attendance on all schools in the Argentine Republic is 117,203, the school population being 459,122. In Chili the attendance is 83,812, the school population 590,941. In Brazil there is a school population of 2,945,000 and the school attendance is 155,058. These Brazilian figures refer only to education in the provinces.

It is said that so popular are the normal schools in Canada that at the one which has been in operation longest there are constantly from 500 to 600 more applications for admission than can be granted. Each male teacher in Canada is by law required to pay into the fund for superannuated teachers $2 every six months, one-half of his total contribution being refunded to him in the event of his quitting his profession.

The Argentine Republic is making fair progress. In his recent address to Congress, President Avellanda said that the nation is now in the enjoyment of profund peace, that wheat-growing had quadrupled within the last five years, and that the exports of 1875 were greater than those of any previous year. The President also observed that the Government expenses had been reduced $4,000,000, and that three railroads had been open for traffic since October. Considering that the Argentines have not escaped "hard times,," this report is satisfactory.

The Madrid correspondent of the Independance Belge says the Jews of the United States have addressed to the King of Spain a petition praying him to restore to the descendants of the Jews expelled by kings of former ages their civic rights and religious liberty. It remains to be seen whether the Ultramontanes will permit the Government to extend the benefits of Article 11. of the new Constitution to the Jews.

In Wesel there is a restaurant keeper, twenty-seven years old, who measures around the waist five feet four inches and weighs over 400 pounds. When the landwehr was lately mustered to attend artillery practice, no uniform could be found that he could get on, and being absolutely good for nothing so far as activity was concerned, he was granted his dismissal, which he very willingly accepted.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 29, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	66,703	Molasses	—
Whisky	1,970	Rice, bbls	443
Corn meal, bbls	3,855	Cut meats, pkgs	12,544
Corn meal, bags	511	Lard, pkgs	4,020
Wheat, bush	533,113	Tobacco, hhds	3,877
Corn, bush	851,380	do. cases	4,172
Oats, bush	236,750	Butter, pkgs	26,614
Rye, bush	47,481	Cheese, bxs	85,430
Malt, bush	19,500	Cotton, bales	4,747
Barley, bush	5,280	Rosin	15,543
Beans, bbls	2,000	Spts. turp., bbls	3,201
Grass seed, bush	400	Dried Fruits, pkgs	13
Beef, pkgs	1,013	Eggs, bbls	7,884
Wool, bales	2,501	Peanuts, bags	1,294
Hops, bales	200	Leather, sides	47,039
Pork, bbls	1,345	Sugar, hhds	25
Tallow	1,318	Oil cake	7,103

AQUILA NON CAPIT MUSCAS.—And so with the RURAL; we always dislike to shoot at small game. Yet there are times when patience must give place to justice to our readers as well as to our efficient staff of reporters. We are sometimes forced to print a word or so of protection.

We were about to speak of a pernicious parasite of the press, known as the "circular," which, when an extra advertisement permits, swells into the pompous title of "review." A little yellow specimen of these "reviews" recently—perhaps ignorantly, perhaps dishonestly—garbled one of the RURAL'S valuable commercial reports, and misrepresented the facts by referring to a back date in order to make up a topic for its later paragraph. That is all.

The publication in question proclaims to be issued by the best house in the city! This is indeed modest; especially as current intelligence would naturally inform any reader that first-class merchants have no time to dabble in amateur journalism. It may be that the unfortunate pseudologist who perpetrated the paragraph had luminous visions of a gratuitous notice, if a paper of the RURAL'S prominence could be ensnared into a controversy. "Perish the thought." Such seekers of notoriety remind us of an applicable old story:—"Bless us, what a fat gentleman," said a certain king; and the corpulent party retired satisfied, as he could then truthfully say that royalty had spoken of him.

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 1,117 bbls.; since Jan. 1st, 33,712 do.; same time last year, 18,261 do. Exports of peas past week, 300 bush.; since Jan. 1st, 467,952 do.; same time last year, 228,329. Receipts of beans are light and so far as the demand is concerned, if they should come for a time the market would take on a better shape. Stored lots have a bad reputation since the heat of the past month and fresh supplies also suffer from the established impression as to unsoundness. Mediums are unchanged except for a few parcels of perfect keep. Marrows of fine exporting grade are scarce and though they are higher, the improvement is not in keeping with their special position. Red Kidneys keep up a trade. White Kidneys and pea beans are nominal, the latter are very unsuitable in quality for best Eastern buyers. Canadian peas are in light stock. Other peas quiet and unchanged.

Beans—Prime pea, $1.20@1.25; fair to good, $1.00@$1.10; prime mediums, 90@$1.; fair to good, 70@80c.; poor, 40@50c.; prime marrows, $1.37@1.40; fair to good, $1.15@1.25; prime white kid., $1.20@1.30; other, $1.00@1.10; prime red kidney, $1.35@1.45; other, $1.15@1.25; Lima (Cal.), $2.75@3. Black beans, $3.75@4. Peas—Canadian, in bulk and bond, 70@—c.; green, $1.00@1.10; Southern B. E., 2-bush. bag, $2.65@2.70; split, ₩ bbl., $6.

BROOM CORN.—Ranges 7@9c. for best and 3@4½c. for other. Market dull. Crop reports favorable; reported unusually large.

BUTTER.—The cool days of the past week brought out a rush of buyers and the receipts did not supply the sudden wants of trade. There is an abundance of butter here but it has gone through so many deteriorating phases of melting and cooling that buyers almost totally disregard it; while for that matter holders have refrained from showing it to any good class of trade. Retailers have consequently run short of fine or desirable stock and the first chances to replenish have created a firm tone in prices. We say tone only because at this season the regular requirements of the local trade are moderate and with good shipping weather it will not take long to stock the market and summer trade is not price-supporting only when there is a scarcity. Choice pails and creamery have shown the most firmness, 30c. having been readily paid for selections. Fine state tubs for the moment are also strong at the new figures, but must be strictly sound and sweet to bring the extreme. Western fresh receipts are stiffer in price but are mainly unchanged. Exporters are still working off stock but insist upon concessions for round parcels; these best payments have been 16@17c. There is quite an enlarged outlet for butter to our immediate neighborhood, including river towns owing to the decreased local yield during the drouth.

The following useful hint we clip from the Producers Price Current.—"We recommend shippers and packers of western butter in tubs to carefully assort their packages into invoices so that the latter will run straight and uniform in color, seasoning, flavor and style. To show the importance of this we mention that where the packages are not uniform the contrast of quality increases the defects. For instance a lot of butter of fair color, if it contains a few packages of deep yellow, will by the contrast be light colored; whereas if the deep yellow packages were separated the lot might not be objected to on the score of color."

We quote:—Choice pails, 27@28c.; prime, 25@26c.; poor to good, 19@23c.; creamery pails, choice, 28@29c.; good, 26@27c.; sweet cream pails, 27@27c. State firkins, choice, 26@27c.; fair to good, 22@23c.; do. half firkin tubs, choice, 26@27c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 24@25c.; other, 19@21c.; Western creamery, choice, 25@27c.; other, 21@24c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 18@19c.; other, 13@14c.; factory choice, 18@17c.; other, 13@14c.

CHEESE.—Early in the week trade dragged, with rather an easy feeling, as regards prices, but with the country sales showing comparative ready sales and indications of lighter arrivals, there soon set in a steadier feeling, which was further enhanced by the better position of the market abroad. Business towards the close became quite active in fancy factories, and the grade is probably well sold up this week—9¼c. was the best general rate, and indeed some parties claim this the best price they obtained at the close, although the principal transactions now are at 9¼@9¼c., showing a rise of one-quarter cent on the figures current the previous week. Shippers are unusually careful in their selections, pretty generally anything under strictly fine. Respecting good, and grades under the market, can scarcely be called in any better shape than last week, but slightly favored perhaps by the cooler weather. They are, however, very difficult to sell, and show about the same wide difference of rates referred to recently. The quotations are:

New 9¼@9¾c. for fine and fancy factory; 7¾@8c. for good; 6¾@7¼c. for fair; do., half skimmed, 4@6c.; do., skimmed, 3@4c. State farm dairy, 8¾@8¾c.; good to prime, 7@8c.; fair to good, 5¾@6¾c.; Western factory, good and prime, 6¾@7¼c.; fair lots, 6@7c.; do. cheddar, choice, 7¾@8c.; do. flat, choice, 8@8¼c. Exports past week, 92,539 boxes.

COTTON.—Export demand is still slow and otherwise but little doing; closing prices are for

July, 11¾@11 29-32c.; August, 11 29-32@11 15-16c.; September, 11 23-32c.; October, 11½c.; November, 11 13-32@11 7-16c.; December, 11 7-16@11 15-32c.; January, 11 19-32@11¾c.; February, 11¾@11 25-32c.; March, 11 29-32@11 15-16c.; April, 12 1-16@12 3-32c.; May, 12 3-16@12 7-32c.; June, 12 11-32@12¾c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	8 5-16	8 5-16	8 5-16	8 5-16
Strict ordinary	9¾	9¾	9¾	9¾

Good ordinary	8¾	Low middling	10
Strict ordinary	8¾	Middling	10¾

DRIED FRUITS.—There is no improvement in demand, and prices as before. Desirable lots of apples are in small stock.

State, sliced, 8@8¼c.; do., quarters, 7¾@8¼c.; Southern sliced, 8@8¾c. for prime; Blackberries, nominal. Pealed peaches, good and prime Georgia, 10@12c.; fancy, 13c.; unpealed peaches, new, nominal for halves and for quarters. Plums at 12@13c. Raspberries, 24@25c. Cherries, 14c.

EGGS.—The strong and upward tendency of our markets here a short period ago has made country shippers industrious in picking up stock and sending what could be spared from other cities. The addition, however, did not strike the market at a favorable period, for the extra demand began to subside a week ago and the general inquiry at the close is tame. Ice-house eggs are not generally a success. They sink in quality very suddenly after exposure to natural temperature.

Near points, 20@21c., State and Penn., 19@19¾c.; Western, prime, 18c.; do. other, 17@17¾c.; Canadian, 17¾@18¾c.

ESSENTIAL OILS.—Oil Peppermint, in glass, $3.75 ₩ lb.; in tin, $3.25. Spearmint, in glass, $3.50; in tin, $3. Wintergreen, $3. Sassafras 75c.

FEATHERS.—Quiet. We quote prime live Western geese, 52@55c.; other do., 35@45c.

FLOUR.—The market is recovering from the depressed feeling which existed for so long a period. Exporters are now buying more generally and there is a better home trade demand. Quotations are:

For poor to very choice superfine State, $3.35@4.20; $4.35@4.50 for very common to fair extra No.; $4.60@4.65 for good extra do.; $4.65@5.00 for fancy do., and $5.05@6.50 for very choice extra; $3.35@4.20 for superfine Michigan Indiana, Iowa, &c.; $4.40@4.65 for shipping extra do., the inside price for inferior, and $4.70@4.80 for choice to very fancy extra do.; good to choice white wheat extras at $4.90@5.00; fancy No. $5.05@7.25; winter wheat, good to choice family city mill extras, $7.25@8.50; round-hoop Ohio, $4.35@4.80, and trade brands of do. at $4.85@5.75; St. Louis, $4.80@5.00 for common to fair extra, and $5.05@5.50 for good to very choice; Minnesota "straight" at $5.00@5.60, and patent at $5.30@5.50; unsound stock at from $2.15@5.10; No. 2 at $2.25@3.15; city mill at $4.60@5.90.

FRESH FRUITS.—Apples are arriving freely from all sections and cheap rates are ruling, even for fine and seasonable table varities. Common summer pears are also low and seldom touch the extreme. California embellishes the market with a car or so per week of plums and Bartlett pears. The last invoice of the latter was most too ripe for steady prices. The plums are fine and showy including the Damne purple and Columbia gaged. Peaches are in daily supply, but do not give satisfaction being generally hard and of deceptive color. Our older fruit dealers very correctly state that "taste is spoiled for good early markets through the mistake of growers sending in stock that will disappoint the expectation of consumers. Blackberries have a good demand at the close and have latterly realized good figures. Raspberries had a short season. Whortleberries sell readily, it is noticeable that the call for these berries improves yearly, restaurants using them very freely. It seems to be a poor season for Watermelons they open poorly and sales are slow, about the only prime ones we have seen thus far was a small lot from Texas. Southern muskmelons not wanted, New Jersey more than supplies present wants. Virginia grapes it is said will be a success this season. The Cranberry crop will be a light one at both the East and New Jersey though the promise opened good. The West also reports probable injury to the crops. Peanuts have not had their customary demand, but as the stock is not large and the new crop not expected to be heavy prices are fairly firm.

Apples, Sweet Bough, ₩ bbl., $1.50@2; sour, do., $1.00@2.25; Red Astrachan, $2@3.50; common, 50c.@$1. Pears, California Bartlett, ₩ box, $5@5.50; Southern, fancy, crate, $3@4; Ball, bbl., $3@4.25; sugar, $1@3; Cooking, $3@3.50. Peaches, Maryland, fancy, crate, $4@4.50; other, $2@3.50. Plums, California, box, $5@6. Blackberries, ₩ quart, 10@20c. Whortleberries, ₩ bush., $1.75@2.25. Currants, red, 6@7c.; white, 7@8c.; black, 7@8c.; cherry, 10@12c. Muskmelons, New Jersey, ₩ bbl., $3@4. Watermelons, Georgia, $15@35; Virginia, $8@20; Texas, $30@40. Peanuts—Virginia, prime, ₩ bush., $1.65@1.85; Wilmington, $1.50@2; common, 90c.@$1.25.

GRAIN.—For wheat, prices have reacted about three to five cents per bushel from the lowest prices, with the cooler weather and stronger demand. Latest sales are:

No. 1 Milwaukee spring at $1.15@1.17; No. 1 Sheboygan at $1.20, afloat; small lots of No. 1 Minnesota spring at $1.10@1.15 for soft to prime; 92@97c. for very soft to very good steamer lots No. 2 Milwaukee spring; 95c. for fair to strictly prime No. 2 Chicago, chiefly at 98½c.@$1 afloat, and 97c. in store; 82@85c. for No. 3 Milwaukee hot and soft, and 75@83c. for do. Chicago; 90c.@$1.15 for very soft to choice ungraded spring. Rye at 50@63c. for Western; 55@58c. for State. Corn is higher and fairly active; quoted at 58½c. for poor steamer to best sail lots ungraded Western mixed; 52@54c. for fair to prime steamer, and 50@51c. for poor do.; 55@57c. for yellow western; 46@52c. for hot, warm and damaged. Oats are higher and partly active; sales at 35@38c. for No. 2 Chicago; 43@47c. for white State.

HAY AND STRAW.—Supplies of new hay are liberal, and the trade buy moderately with prices easy.

Sale hay is quoted:—Shipping, 60@65c.; retail qualities 80@95c.; clover, 50@55c.; salt, 55@65c. Straw is quoted at 80@90c. for long rye; 60@65c. for short rye; 45@50c. for oat.

HIGHWINES.—Bring $1.13 per gallon.

HOPS.—There has been rather more doing this week. The purchases include about 400 bales for export. Prices are steadily held. Advices respecting the crop are more unfavorable. It is thought that the yield per acre will fall short about ⅓ as compared with last year, but the increased acreage planted will probably make up a good part of the deficiency. We quote:

N. Y. State, 10@17c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c., ₩ lb.

LEATHER.—Hemlock sole at 19@20c. for light; 20@23c. for middle; 21@23c. for heavy; 17@19c. for good damaged.

OIL CAKE.—Western selling at $38.50 per ton.

POULTRY AND GAME.—The few lots of dressed that arrive are weak in price, cheap coops of live giving us a pretty free offering. We quote fowls, 13@18c. for scalded and picked; best sprlug chickens, 22@24c.; other, 15@19c.; turkeys, 13@16c.

Live poultry is abundant and lower. We quote spring chicks, near points, 17@18c.; Western, 16@17c. Fowls, N. J., ₩ lb 15@16c.; do. Western, 15@—c. Roosters, 9@10c.; Turkeys, N. J. 12@15c.; do. Western, 12@14c.; Ducks, N. J., pair, 75c.@$1; do. Western, 50@60c.; Geese, N. J., $1.75@2.25; do. Western, 1.25@1.50.

Best woodcock are a shade higher. State quoted at 70@75c.; Western, 65@70c. Stall-fed pigeons, $1.25@1.50; do. squab, 75c.@$1; tame live pigeons, ₩ pair, 30c.

PROVISIONS—Of hog products there has been a pressure to sell, while demand has been light for exporters. Mess pork quoted at $19.15 for August and $19.30 for September. Bacon at 10¼c. for long clear. Lard at $11.12½ for spot lots; $11.02½@11.05 for August; $11.15@11.17½ for September. Stearine at 14½c. for choice Western. Beef hams at $30 for choice. Southern tallow at 8 5-16c. for prime. Beef at $8@11 for plain mess, $12 for extra mess, and $13 for packet, the outside prices for small lots choice. Pierced quoted nominal for prime mess and India mess. City extra India mess at $19.

SALT.—Quoted at $2.50 for Ashton; $1.15@1.40 for other brands.

SUGAR (Refined).—Soft yellow, 9¼@10¾c.; soft white, 10¼@11¼c.; hard, 11¾@11¾c.

SUNDRIES.—Ginseng, ₩ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₩ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—There has been a very good export demand for Kentucky leaf and a fair trade in seedleaf, with prices well maintained.

VEGETABLES.—Potatoes are scarce and firm. For a novelty, Western new will be here very early, owing to the diminished crops of L. I. and N. J. We quote the latter $3@4 ₩ bbl. Corn and tomatoes have a good demand. Cabbages scarce and high. We quote:

Green corn, ₩ 100, $1@$1.25. Norfolk tomatoes, 50@75c. ₩ crate; Long Island, bush., $1.25@1.50; New Jersey, do., 75c.@$1, ₩ crate. Marrow squash, bbl., $1.75@2.00; crook neck, $1.75@2.25. Wax beans, bag, $3@3.50; Cucumbers, L. I., ₩ 100, $1@1.75; do. N. Y., do., 50c.@$1. Turnips, Russia, ₩ bbl., $1@1.25. Cabbages, L. I., $6@10 ₩ 100. Potato onions, $1.50@2.25 ₩ bbl.; white do., $2.75@3.

WOOL.—A slight improvement in trade, but yet no especial life, the recent auction sales of goods, being dispiriting. The disposition among manufacturers is to buy only to provide for urgent requirement. Sellers on the other hand in consideration of current low prices are not inclined to press business.

Mill feed dull at $13 for shorts, $14 for shipstuffs, and $17 for middlings. Railroad Freights—Flour to Boston, 40c. ₩ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., July 29, 1876.

THE heated term has given way for a spell of cooler weather, much to the gratification of dairymen and dealers who are interested in the movement of butter and cheese. But notwithstanding the favorable weather for shipping cheese, trade is dull and prices declining. Between 300 and 400 boxes of farm dairy cheese were on delivery this week and sales ranged at 8@8¼c., extra lots only reaching the latter figure.

The offerings from factories aggregated 10,000 boxes and upward, the larger part of which changed hands, some being sent forward on commission.

Prices were about ½c. lower than for the week previous, 9c. being "top price," though 9¾c. was reported for two lots exceptional sales and hardly to be named as market rates. The range of prices therefore may be quoted at 8¾@9c., the bulk going at the last figure. Quite a number of factorymen held over their goods for another week.

There was a light delivery of butter; that from farm dairies bringing 21@22c., and creamery in return pails 23c. Since the decline in the price of butter and the hot weather, we notice some of the creameries selling at this market, are holding back their goods under the impression that rates will advance.

The weather has been favorable for the hay harvest and farmers are well up in their work. Pastures are excellent for the season and cows are reported to be doing finely in every direction.

We have advices from abroad for the second week in July. Our London correspondent says American cheese clears as landed, especially fine and the lower sorts. The arrivals are expected to be of good quality and prices are thought to be at the lowest. The weather has been too hot to handle English cheese, old or new. The quotations are as follows:

American, extra fine, 56c.; fine, 52@51s.; good, 42@50s.; common and low grades, 30@40s. English cheddar sells for 76@90s.; Wiltshire double, 62@68s.; Cheshire medium, 45@51s.; fine, 72@84s., Scotch, 60@68s., Dutch cheese—Edams, 56@58s.

The intense heat has had a tendency to check the trade in butter. The supply of oleomargarine has fallen off and a supply is not expected if the weather continues hot. We give prices:

Dorsets, 136s.; Jersey, 104@106s.; Normandy, 112@122s.; American and Canadian, 90@105s. ₩ cwt.

Oleomargarine, or artificial butter, is not in market and quotations are not given.

LIVE STOCK MARKETS.

NEW YORK, July 29, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.

Totals this week	9,130	41	2,162	16,126	21,432
" last week	9,251	72	3,419	23,905	18,236

BEEVES.—Trade opened slow but firm on Monday last. The quality of the herds to hand was from course to good, being in general scarcely fair. Prices ranged from 8¼@11c. ₩ lb.; weights, 5¾@6 cwt. From 55@57 lbs., net, were allowed. The markets closed without any herds remaining unsold. Trade opened fair on Wednesday, but closed weak at ¼c. ₩ lb. reduction on the closing rates of the previous Monday, while the herds to hand were very generally coarse, ranging from poor to good, and selling at 8@10¾c. ₩ lb.; weights, 5@8 cwt. On Thursday trade was small at 7@10¾c. ₩ lb.; weights, 4¾@8 cwt. Friday the markets closed slow, prices having been 8¾@10¾c. ₩ lb.; weights, 5@9¾ cwt. From 55@57 lbs., net, were allowed; general sales on 56 lbs. net. Spanish herds, grass fed, sold at 7@8c. ₩ lb.; Native steers sold at 8@10c. ₩ lb., grade do., 10@10¾c. Oxen sold at 9@10¾c. ₩ lb. Mixed herds, 9@9¾c. ₩ lb. Bulls, live weight, 4@4¾c. ₩ lb.

Comparative Rates.

Quality.	This week. Cents.	Last week. Cents.
Good	11¼@	11¼@
Fair	10¾@11	10¾@11
Poor	9¾@10¾	9¾@10¾
Poorest	7 @ 9¾	7 @ 9¾
Gen. selling rates	9 @10¾	9 @10¾

MILCH COWS.—We have no change to note in this branch of trade. The cows to hand are not good enough to meet the demand, and sales, therefore, are slow at low rates. Nineteen cows sold at $40@55 ₩ head, 23 at $50@35, and 10 at $30@42—calves always included.

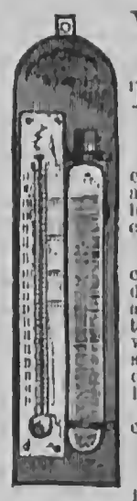
VEALS AND CALVES.—Smooth quality veals in fair demand at 7¾@8c. ₩ lb. Ordinary quality calves in heavy supply and slow of sale at 5@5¾c. ₩ lb. Grass fed calves of coarse quality sold at $4@8 ₩ head. Buttermilk-fed calves sold at 4@5c. ₩ lb. State veals sold at 7½@8c. ₩ lb. Slate calves at 4@6c. ₩ lb. Jersey calves sold at 8¼c. ₩ lb. Jersey veals at 8c. ₩ lb. Pennsylvania veals at 8c. ₩ lb.

SHEEP AND LAMBS.—Trade very slow in sheep and lambs of ordinary quality, with a fair demand for those of good quality. We quote sales of sheep Monday last at 4@5¾c. ₩ lb., and sales of lambs at 5¾@8¾c. Wednesday, sheep, 4¾@5¾c.; lambs, 8¾@8¾c. Thursday, sheep, 4¾@5¾c.; lambs, 6¾@8¾c. The market closed dull on Friday; sheep, 4¾@5¼c.; lambs, 6¾@8¾c. Ohio sheep sold at 4¾@5¾c ₩ lb.; State do., 4¾@5¼c.; Kentucky do., $5@5.40 ₩ cwt.; Indiana do., 4¾@5¼c. ₩ lb.; Canada lambs, 7¾@8c. ₩ lb. Kentucky do., 6¾@8c.; Jersey do., 8@8¾c.; Pennsylvania do., 7¾@8¾c.

HOGS.—There have been no sales of live hogs since our last weekly report. City dressed limeline at 8¾@9c. ₩ lb., weights, from 200 lbs. up to 110 lbs. down ₩ head.

HORSE MARKET.—City trade is still languishing. Nineteen poor quality light harness horses sold at $75@105 ₩ head; 29 ordinary do. at $120@200 ₩ head; 13 roadsters with moderate trotting action sold at $207@320 ₩ head; 30 course quality heavy draft horses sold at 100@195 ₩ head. No sale of valuable horses reported.

New Advertisements.



What will the Weather

BE TO-MORROW?

The Signal Service Barometer

WILL TELL YOU.

It will detect and indicate correctly any change in the weather 12 to 24 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators.

FARMERS

can plan their work according to its predictions. It will save 50 times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. Will send it express paid to any address on receipt of $2. Send Money Order or Registered Letter.

Agents wanted—send stamp for Circular. **H. W. POOL & CO., 835 Broadway, New York.**

The Boston Traveller says:—"We carefully inspected the above-described Signal Service Barometer, and find it to be as stated by Messrs. Pool & Co., who are honorable and reliable."

"MY native city has treated me badly," said the drunken inhabitant of a place celebrated for its whisky, "but I love her still." Probably her still was all that he did love.

AT the end of an Indiana marriage ceremony, the bride advanced gracefully to the clergyman, and requested him to announce the hymn, "This is the way I long have sought."

UPON the death of a woman who was a chronic borrower, an unfeeling neighbor observed, "She won't be buried there a week before she'll be calling on the other tenants for their flowers.

"TO you, my young friends," said the President of a Western College to his graduating class, "to you, we give a glorious future." "A present would be more acceptable," screamed a voice in the crowd.

THE Hessian fly is doing much damage in Iowa, and a Keokuk paper inquiringly asks whence this new post-origi nated? Why everybody ought to know that it was Washington who made the Hessian fly.

TWO Jews were distinguished, one for his skill in pugilism, the other for his fondness of the fair sex. A gentleman, on being asked to what tribe they belonged, answered, "I don't know; had they not been Jews, I should have supposed one of them to be an 'Amorite' and the other a 'Hittite.'"

A gentleman from California is now in Chicago negotiating for the purchase of a full-sized canal schooner to take a cargo of black walnut lumber from Chicago to San Francisco, via the St. Lawrence and Cape Horn.

THERE is no such word as fail in the vocabulary of the Tennesseean. One of them is going to eat a half bushel of strawberries in half an hour on a bet, or leave a widow and seven fatherless children to dig stumps for the neighbors.

CLARA BAUER, who was quite well known as a novel writer in Germany, died in Breslau on June 29. She had passed years of her life in Russia, and her last novel, "A Document," is said to be an able portrayal of the best Russian society.

WHEN a 200-pound darkey woman throws herself into a centennial rolling-chair and pays over her 60 cents for an hour's ride the gloom that settles over the gentlemanly white attendant's face can be felt from one end of the grounds to the other.

SOME people were talking with Jerrold about a gentleman as celebrated for the intensity as for the shortness of his friendships. "Yes," said Jerrold, "his friendships are so warm that he no sooner takes them up than he puts them down again."

MR. E. A. SOTHERN, who is in Philadelphia, is extremely ill from the effects of the heat. He has been threatened with congestion of the brain, and his condition now is quite serious. His physician says he may not be able to play for some time to come.

CURRAN, being angry in a debate one day, put his hand on his heart, saying, "I am the trusty guardian of my own honor." "Then," observed Sir Boyle Roche," "I congratulate my honorable friend on the snug sinecure to which he has appointed himself."

DE RUDIO, known to fame as a lieutenant in the United States army, who figured conspicuously here in the election of 1874, and as a co-conspirator with Orsini and Pierl in the attempt to assassinate Napoleon III. in 1857, is one of the survivors of Custer's command.

THE Burlington Hawkeye is inclined to harbor the conviction that, "No man can realize the geological history of creation, the slow, regular development and shaping of things in the slow unfolding centuries and ages, until he has watched a gang of men at work on the streets."

AN Englishman who had let his barber's account run for twenty years was confronted, the other day by a bill for nearly £32, the barber charging a penny a day. The man refused to pay the amount but offered to settle at the rate of £200 per acre of surface shaved. His face was measured and his bill then amounted to £73 7s. 8d.

MISS ALLISON, the engineer of the machinery in the Woman's Pavilion at the Centennial, is reported very ill in consequence of overwork and anxiety. Better take the dangerous toy out of the girl's hands, lest she faint away at some critical moment, and the Woman's Pavilion and its cause be started heavenward by steam.

MISS MULOCK mentions four professional pursuits in which women can now support themselves in England—teaching, painting or sculpture, literature and public entertainment. In America we have added the medical profession to the list, as has been done also in France. The University of Michigan and some other institutions graduate a few lawyers also each year.

LOUIS XIV., who loved a concise style, met on the road as he was traveling into the country, a priest, who was riding past; and, ordering him to stop, asked hastily:—"Whence come you? Where are you going? What do you want?" The other, who perfectly well knew the king's disposition, instantly replied:—"From Bruges. To Paris. A benefice." "You shall have it," replied the king, and in a few days presented him to a valuable living.

THE late Miss Martineau left an injunction in her will, the Birmingham Post says, against the publication of any of her private letters. A London correspondent of the Leeds Mercury also writes, "I understand that Miss Martineau had not only completed her autobiography previous to her death, but she had also had it printed and corrected. The work will form two volumes, and will be illustrated by a number of woodcuts. All that remains to be done, in fact, is to have the sheets bound and issued by a publisher."

ABDUL AZIZ'S private collection of jewelry valued at six million Turkish pounds, has been seized and turned over to the Finance Department for sale. One piece is a coffee service; that is to say, a coffee service according to Oriental ideas, neither coffee-pot, sugar bowl, nor cream jug, merely a salver, with twelve cups and saucers, the former being about the size of an egg-glass, but all in solid gold, each piece incrusted with brilliants and emeralds, and the whole cost £10,000, or about fifty-one thousand dollars in American currency.

THE Alexandria Sentinel says that the following letter from Gen. Custer to the Confederate cavalry general, Rosser, was entrusted by Custer to a farmer near Spottsylvania Court House, after a brief engagement between their respective commands, to be delivered to Rosser:

Dear—: You expose yourself too much on the field, old fellow. I recognized you yesterday, and with difficulty saved your life by stopping my fire. Don't do so again, but live to laugh over old times, after the war, with your friend,

G. A. CUSTER.

P. S.—I whipped Fitz Lee on Wednesday, and intend to give you a good dressing the first chance I get in a fair field.

Rosser read the letter to his staff, and laughingly remarked, "it was just like Fanny."

ANSWERS TO CORRESPONDENTS.

(1) Will you please describe a bug? (2) Are all insects having four wings beetles? (3) Is this wingless creature, now destroying potato vines, a grub, bug, or an embryo beetle? If the latter, will it pass through the pupa state, or will the wings gradually grow on it? BOREN.

(1) It would be somewhat difficult to give you a correct idea of the difference between the order of *Hemiptera* or true bugs, and *Coleoptera* or beetles, in the limited space which can be spared in these columns. But we will say that the two grand divisions of Hemiptera are composed, 1st. Half-winged bugs, called *Heteroptera*, having the basal half of the front wings coriaceous, or leathery, for instance, the common stinking or squash bug, bed bug, etc. 2d. Whole-winged bugs or *Homoptera*, having all four wings of a uniform membranous nature, folding straight down the back when at rest—for example, the common tree-hopper. By procuring some illustrated elementary work on entomology, you would soon be able to distinguish bugs from beetles, moths from butterflies.

(2) No; all insects having four wings are not beetles, for, in fact, beetles have only two true wings, with a pair of shields to cover them, hence the name of the order *Coleoptera*, which means shield-winged insects. There are some species of beetles which have no shields, or elytra, as these organs are termed, while there are others having very full and perfect elytra, but no membranous wings, consequently they are unable to fly.

(3) The wingless grubs, or more properly, *larvæ*, of the Colorado pest, after feeding and growing awhile, rests for a few days in what is termed the *pupa* state, then bursts its pupa skin and comes forth a true and very perfect beetle, with two membranous wings and two horn-like shields, or elytra, upon each of the latter. There are five black lines, making ten upon all, hence the scientific name of *Chrysomela* (*Doryphora*), 10-lineata. To speak of one of these insects as a *bug*, is as incorrect as it would be to call a turtle a horse. Still, men who know better often call them bugs, in order to be understood.

G. W. N.—You can obtain the Transactions of the American Pomological Society by addressing the Treasurer, THOMAS P. JAMES, Esq., inclosing four dollars, thereby securing a biennial membership.

"Barry's Fruit Garden," price, $2.50, or "Thomas' American Fruit Culturist," price, $3.75, are both excellent works, and would no doubt suit you.

Subscriber.—We have had no experience in making vinegar from sorghum sirup, therefore will ask some of our readers to answer your question.

C. E. A.—The branches and young twigs of your apple trees are probably afflicted with what is termed apple-tree blight. The cause of this malady is unknown, but is often quite destructive. Cut off all affected twigs as soon as the leaves begin to turn brown, as this will sometimes check the spread of the disease. You will find on another page an answer to your question in regard to budding trees.

R. V. D.—You should watch our advertising columns for information about game and other kinds of fowls, as that is the place we have to look for such articles when in want. At present we do not know who has this breed for sale.

Nurseryman.—The reason why your single, lone Box-Elder or Ash-leaved maple tree has no seed in the pod is because it is a pistillate (female) tree and there are no staminate (male) in the immediate neighborhood. This species of maple bears its two sexes of flowers on separate trees, hence both must be growing in close proximity, in order to obtain perfect seeds. We have a very large pistillate tree in our own grounds, which is loaded with the keys or seed vessels every year, but they are empty, not a germ ever appearing in one of them, for the reason given above.

A. C. asks if we deem plants in a sleeping apartment injurious to health. She says that her husband objects to her plants being in their bedroom, where there is a sunny window, and insists that they shall be removed at night. She herself has read that plants purify the atmosphere.

ANS.—It is now well known that plants give off carbonic acid gas as well as absorb it—that they absorb oxygen as well as liberate it—but that the quantity of oxygen absorbed and of carbonic acid gas liberated, is decidedly less than the quantity of oxygen liberated and carbonic acid gas absorbed. This, however, can only be said of healthy plants in a state of growth and exposed to the sun's rays, which are essential to decompose the gas in the leaf which retains the carbon and liberates the oxygen. A plant may grow in the dark, but its growth destroys it. Light and heat are essential to its nutrition. When we consider the imperfect light that sleeping-room plants get; when we consider their white, yellow, decaying and dead leaves—the stagnant moisture of the pots and earth in them, we doubt if they do not in a majority of cases, more poison the air than purify it. At best or at worst, however, it is probable that they do so little of either that Mr. A. C. need not put you to the trouble of removing your plants nightly; and the less *you* say about their *beneficial* effects, the more nearly you will approach to what seems a rational view of the question.

E. Cutler asks: (1) "What is the cause of water boiling? (2) Why does steam, after it leaves the teakettle, burn the hand even worse than boiling water?

ANS.—Any chemistry answers these questions more fully and accurately than we can answer them in brief. The pressure of the atmosphere is 15 lbs. to the square inch. Water, at about 212° at the surface of the earth, overcomes the pressure and boils. The atmosphere varies in its pressure—hence the boiling point varies also. The agitation of boiling is caused by the formation and bursting of steam bubbles which formed at the bottom of the kettle, rapidly make their way through the body of water like so many balloons. (2) Water is never raised above 212°, because the continued heat which would otherwise raise its temperature higher, becomes latent in steam. This when it condenses upon the hand gives out its latent heat, and the burn is therefore more intense than that from boiling water.

Marion, Noble, Co., Ind.—Have the kindness to send to Floricultural Editor your name. Your letter, published in RURAL of July 8, is lost. The flower is *Moluccella laevis*. We have an article written upon it to be published next week.

Amateur., Jamesburg.—It has been my intention this season to attempt experiments toward improvement in small fruits—blackberries and currants particularly, both by cultivation and seedlings. Your article, in June 24th, gave me just what information I needed as to treatment of seedlings, though I have already an oddity under way of my own. Will you be good enough, through your "Answers to Correspondents," to reconcile two statements in that article that have puzzled me. You say: "The seed should not get thoroughly dry," etc., and again: "When cold weather sets in, bury in the ground," etc. Now what bothers me and the information I should be grateful for is this: (1) I have splendid specimens saved, shall I cover them in sand at once? (2) If so, how shall I keep the seed till cold weather begins? An answer to the above will greatly oblige a constant and enthusiastic reader.

I have marked one or two bushes of native blackberries growing near me, which are of superior merit as to taste, productiveness and size of fruit, and this fall I intend to see what cultivation will do for them. One bush is of such excellence that I think it will prove valuable.

ANS. (1) Yes. (2) Place in box, and bury seed and sand in the ground, or place in a cool, dark cellar.

Seedsman.—We have read the new section of the Postage Laws as passed, but fail to see that nurserymen and seedsmen are benefited thereby, for there is not a word in it referring to seeds, plants, cuttings and similar articles—in fact, like most acts passed relating to postage matters, it is just indefinite enough to leave everybody in a muddle as to what it does mean and afford each and every postmaster an opportunity to construe the same to suit himself.

Pear Grower.—There is no need of applying Hellebore or other poisons to pear trees in order to get rid of "slugs" on the leaves. Dusting quicklime over the trees will destroy this insect quickly and as effectually as anything known. The larvæ of the different species of saw-flies, usually known as "slugs," which infest various kinds of trees, all yield readily to lime.

L. H. R.—The cluster of purple flowers left at the RURAL Office for a name, are those of the *Cleome grandiflora*. It belongs to the *capparidaceæ*, or Caper family. It is a tall-growing plant and the flowers quite showy, hence frequently met with under cultivation.

Anna R., West Va.—Mamma has a fine Calla which has been in bud for nearly two months, but never has opened; on examination we have found that the top of the bud is withering. What is the cause? Is it that the shoots which have sprung up have prevented it from blooming?

ANS.—No, we think not. Do you give it enough water? Is the soil loose so that water can reach the roots? Is the drainage perfect so that the water does not become soggy and sour? When you can give an affirmative answer to the above, your Calla will thrive.

W. B. J.—Polianthes is from two Greek words, meaning City and Flower, and was applied to a class of plants usually grown in city gardens—one species of which is the Polianthus tuberosea. In refering to this species, it has become common to discard the name of the genus altogether, distort the pronunciation of the balance and call it Tuber-rose or Tube-rose.

Agents Wanted.

AGENTS If you want the best-selling article in the world and a solid gold patent lever watch, free of cost, write at once to J. BRIDE & CO., 767 Broadway, N.Y.

ARE YOU OUT OF EMPLOYMENT? Send for our Illustrated Catalogue of Subscription Books, many of which find a ready sale even in these times. Some of our agents are clearing ten dollars per day. D. APPLETON & CO., Publishers, 549 & 551 Broadway, New York.

WHEAT GROWER.

GEO. E. WHITE'S CLIMAX SUPERPHOSPHATE, prepared specially for the wheat crop, is for sale at 159 Front St., New York.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Traveler's Guide.

JOHN CRUMP, - - Proprietor,
Chestnut St., cor. 15th,
PHILADELPHIA.

CALIFORNIA.

Have you any thought of going to California?
Are you going West, North or Northwest?
You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO,

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

FEE mail help—Postage stamps.

THE nation's tear—The frontier.

A MATTER of course—A river bed.

A WISEACRE—Your wisdom tooth.

AN oat-worthy animal—The horse.

IMPROPER Practice—A quack doctor's.

CUTTING a Finger—Amputating a limb.

THE only eats worth any money—Ducats.

BLIGHTING dew—The due of a mortgage note.

PERSONS of extended views—Panorama painters.

A DIFFICULT lock to pick—One from a bald head.

A WEDDING Trip—Stumbling over the bride's train.

A BARE assertion is not necessarily the naked truth.

WHAT class of persons may be said to lie the most?—Sluggards.

THE happiest paper in the United States is an Indianapolis daily. It has but one "want."

CRUSTY says the list of marriages in the newspapers ought to be put under the head of "ring frauds."

WHAT is the difference between a good penman and a sailor? One crosses the T's and the other the C's.

PROFESSOR of Rhetoric.—"What important change came over Burns in the latter part of his life?" Senior—"He died."

IT is said that figures won't lie; but the Detroit News thinks the figures of some women are very deceptive to say the least.

AN experienced boy says he regards hunger and the school-master's rattan as about the same thing, as they both make him holler.

IN reading a hymn to be sung one Sunday afternoon, a New York minister recently said: "You may omit the fourth verse. I don't believe it's true."

AN exchange remarks that "some people are wholly unable to appreciate delicate irony." We have observed this ourselves, particularly in the case of washerwomen and shirt bosoms.

"Is there much water in the cistern, Biddy?" inquired a gentleman of his servant-girl, as she came up from the kitchen. "It is full on the bottom, sir; but there's none at all on the top," was the reply.

"MA," exclaimed a Chicago youngster, as he gazed longingly into a bakery window, "what nice pie-ous men bakers are, ain't they?" The mother immediately invested in enough pastry to shut the child's mouth.

A DISSIPATED old negro in Montgomery, Ala. while watching the monkeys in the menagerie in that city, spoke thus:—"Dem children got too much sense to come outer dat cage; white folks cut dar tails off, and set 'em to votin' and makin' constitewtions."

AN Irishman in Iowa was bitten by a rattlesnake, but the liberal use of a neighbor's whisky cured him. The next day he was seen walking slowly on the prairie, and looking earnestly for something. He was asked what he was looking for, "For the boite of a snake," was the reply.

AN odd bit of dialogue occurs in a French novel:—"Where is your husband?" asks a gentleman. "He went to buy a cigar," replies the lady. "Has he been gone long?" "Eighteen years." "He is quite right," remarks the gentleman, philosophically; "he wants to choose a good one."

A WESTERN tailor advertised:—"Wanted—Two or three girls to put on pants." Dr. Mary Walker called next morning and said:—"Now bring on your pants and don't look." The tailor explained, and she left with a sorrowful air, vowing that she would send him a grammar as soon as she got home.

A *soi disant* naturalist was boring Hook with the distinctions in formation and habits between two animals of the same *genus*. Hook, who neither knew, nor wished to know anything about it, exclaimed—"It flashes on me now"—I see the distinction—"it's just the same in swine!" "The same?" cried the astonished naturalist. "Yes," said Hook, "you know some *pigs* are *driven*, and some *pigs* are *led*.

THE kicking propensities of the mule are certainly exaggerated. As we write, a farmer over by the tobacco barn is pulling one around to his place in front of the wagon by the tail. What gentleness the faithful creature exhibits! How meekly he submits too the superior will of his master! How—ah! by the way, the man is evidently an accomplished acrobat—that double somersault he threw over the wagon was very skillfully executed, indeed.

IS THE CENTENNIAL TO END IN SMOKE?

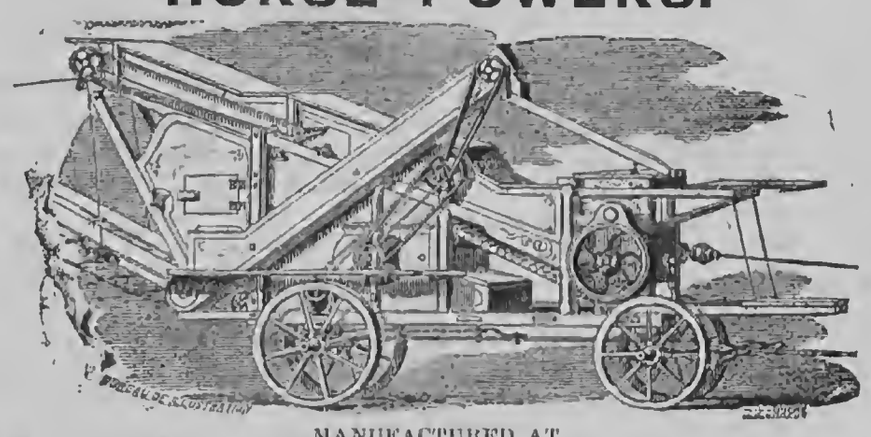
The Buffalo Pitts Threshers
AND
HORSE POWERS.



MANUFACTURED AT
The Pitts Agricultural Works, Buffalo, N. Y.,
Have been known throughout the United States for over thirty years as the
MOST PERFECT AND LIGHTEST-RUNNING THRESHERS
in the world.
FOR THE HARVEST OF 1876

I am offering a large assortment of these Celebrated and Popular Machines, adapted to either Steam, Water or Horse Power.

They combine all the latest improvements which are to be found in other threshers, and some which are found in the Buffalo Pitts alone.

They are built under the direct supervision of PRACTICAL THRESHERMEN (who have followed threshing as a business), and all changes made are the suggestions of experience in the field, and are thoroughly tested there before adoption.

Threshers will appreciate the great advantage of this over

Theoretical Threshing Machine Building.

The greatest care is given to using the very *best material* and to having the work done in the *most thorough* manner.

My facilities for purchasing materials at lowest figures and for economical building are surpassed by none and the machines are offered at the lowest prices at which

The Best Material, put up in the Best Manner, can be Afforded.

In comparing prices Threshers will please note differences in material, workmanship and finish and bear in mind that

The Best is the Cheapest in the end, even though the first cost is greater.

Various sizes are made:—24-in., 28-in., 32-in., and 36-in. Cylinder Threshers and 4-horse, 8-horse, 10-horse and 12-Horse Powers.

Repairs are for sale in almost every county in the wheat-growing country, *at my list price*. For Catalogues, Prices, &c., &c., address

JAMES BRAYLEY, Buffalo, N. Y.,
or 44 South Canal St., Chicago, Ill.

BUILDING PAPER!
FOR SHEATHING, ROOFING, DEAFENING, CARPET LINING AND PLASTERING

These are the best and most economical goods; impervious to dampness, heat and cold. Send for samples to B. E. HALE & CO., 56 and 58 Park Place, New York.

The American
CIDER MILL
will grind more Cider from the same weight of apples than any other mill in the world. Send for Circulars.
ABBOTT, BREW & CO.,
Cleveland, Ohio.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lares of Life.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

Rural Architecture.

CONVENIENT COTTAGES.

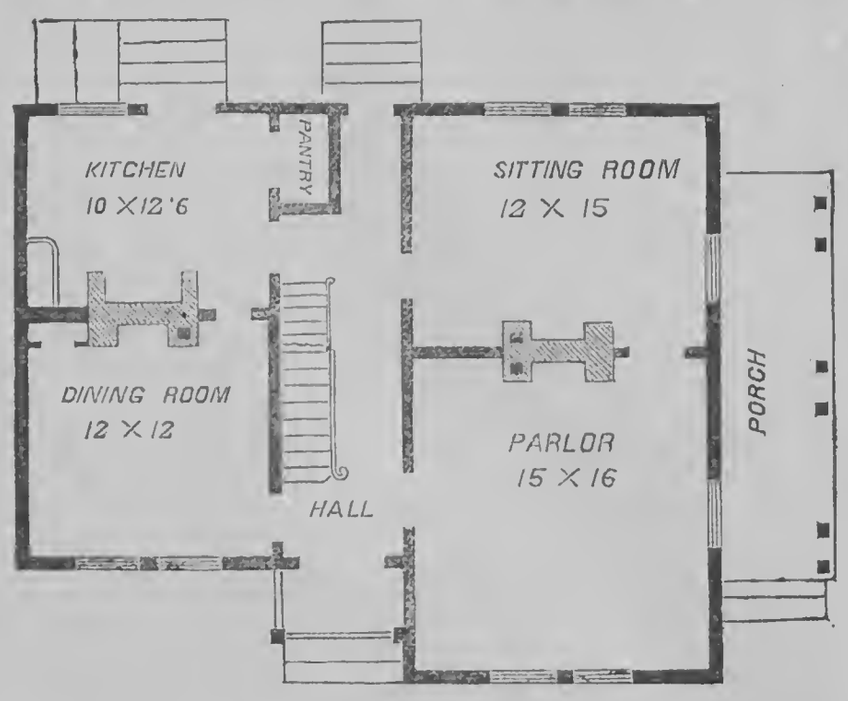
While we do not go so far as the author of a certain book on agriculture as to assert that "a man is known by the house he lives in," still it is our belief that there is a *something* in a residence which gives an inkling of the tastes and social standing of the owner.

The cottage shown in the illustrations on this page will be found to contain a very conveniently-arranged plan of rooms adapted to the use of a moderate-sized family. However doubtful may be the propriety of the use of the French roof in the city, there is no doubt that it offers some splendid points of fitness for country or suburban houses in our climate. Supposing the sides to be built in the usual way of setting up such roofs and a proper space to be allowed between the roofing and the ceiling of the upper story, large air spaces are secured, which are of great value in avoiding, in the rooms inclosed by the roof, those extremes of heat and cold which form so disagreeable a feature of our climate. The use of some one of the various forms which the French roof assumes among us also furnishes one of the readiest means of ornamenting the construction of dwellings. Perhaps there is no other feature in which so great a variety of design may be so easily attained as in the dormer window; and the outline of the roof itself is also capable of many modifications. It is impossible to give any general rule for comparing the cost of such roofs with that of the Italian roof, as much depends upon the number and style of the dormers, but it is usually something more than the cost of the same hight of vertical wall. The cottage represented in our design should be set with the principal entrance facing the east, in which case all the rooms would at some time during the day receive the sunlight.

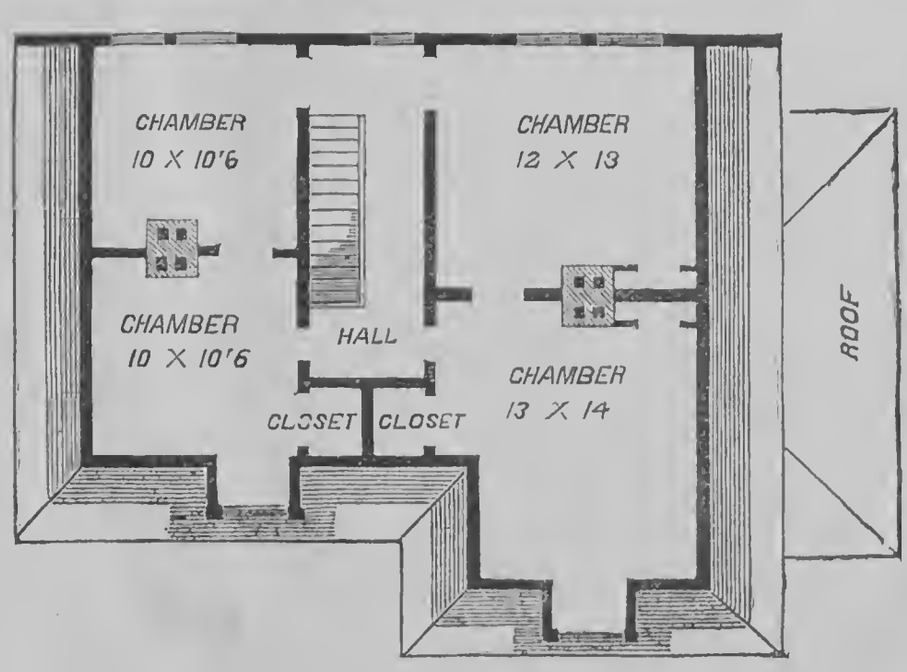
The floor plans, though presenting nothing specially novel, are believed to afford good accommodations — in fact, more than are to be found in houses of a more flashy style of architecture. The principal floor of this design is elevated three feet above the surface of the ground, and is approached by the front steps leading to the platform. The hight of the first floor is 11 feet, the second is 10 feet, and the cellar 6 feet, in the clear. The porch is so constructed that it can be put upon either side of the house, as may suit the owner. The cottage can be built in a substantial manner, with cellar throughout, for about $3,000.

In the planning of low-priced houses, every consideration is too often made secondary to the cost, and those very features which render homes attractive, healthful and delightful are so far lost sight of that their importance is never rightly estimated until the house is occupied and it is too late to think of those changes which, for a comparatively small additional sum, would never have been needed. "A penny wise and a pound foolish" is the adage which is peculiarly suited to low-priced dwellings of the present time. Let us hope that readers of the Rural who contemplate building will bear the adage in mind, and leave nothing undone that may be cause for after regrets.

Convenient Cottage; Cost, Three Thousand Dollars.



First Floor.



Second Floor.

NUMBER OF FAMILIES AND DWELLINGS.

In the official English digest of the census of 1871 there are materials for making a comparison of some important features in the social statistics of Great Britain and the United States. The relation between population and the number of inhabited houses in any given locality has always been held to have a direct bearing upon the sanitary condition of the community. But a house is a rather variable unit to commence with, for, as the English digest puts it, "the ordinary house varies in size and structure in town and country—in its cubical contents, in its hearths, in its doors, and in its windows; so that, to give a correct view of the accommodation which houses afford the population, a special inquiry is indispensable." It is only, therefore, with certain qualifications due to varieties of structure that a fair comparison can be made between the relative proportions of population and inhabited houses in different countries, or in different parts of the same country.

The English census enumerators were instructed to class as a "house" all the space comprised within the external and party walls of every separate building, and precisely the same method was adopted here. Apart from the very decided differences existing between the town architecture of the two countries—differences which tell unfavorably against the United States—it may fairly be concluded that whichever country has the smallest proportion of people in each dwelling has, so far, a sanitary and moral advantage over the other. In both countries the growth of wealth and intelligence has, at each succeeding census, found one of its most convincing proofs in the diminishing proportion of persons to houses. The English census of 1814 showed that there was an average of 5.45 persons to every dwelling in the country, while the census of 1871 shows that the proportion has in sixty years been reduced to 4.98 persons to each dwelling. In 1850 the census enumerators of the United States found a proportion of 5.94 free persons to each dwelling, while in 1870, despite the addition of the former slaves to the enumeration, there were but 5.47 persons to a dwelling.

The official digest from which we have quoted affords some instructive data for comparing the relative density of the population of London and that of New York. As has been frequently pointed out in these columns, the over-crowded condition of the dwellings on this island is without precedent in this or any other country. There are in New York 14.72 persons to each dwelling. The American cities which come nearest to this figure are the following: Fall River, Mass., 9.96; Cincinnati, Ohio, 8.81; Brooklyn, N. Y., 8.64; Lawrence, Mass., 8.40; Jersey City, N. J., 8.37; and Worcester, Mass., 8.35.

In the British metropolis there are 417,767 inhabited houses to a population of 3,254,260, being in the proportion of 7.79 persons to each dwelling. With an average density of population which is exceeded by nine large cities of this Union, London has no separate districts where the poor are huddled into so small a compass as they are in several of the wards of New York City. There are six wards in it in which there are upward of twenty persons to each dwelling.

THE WASH-HOUSE.

For the benefit of our friends building farm houses, in which comfort and convenience are desirable to the "help," as well as general cleanliness to the household, we give the following observations of the late Mr. Loudon, taken from his Encyclopædia of Architecture:

"The wash house should be well lighted; and therefore, when united with other offices, it should, if practicable, be made a corner building, and have windows on two sides. Instead of portable round tubs, which are the most convenient of all the forms that could be devised for washing by hand, oblong troughs, about three feet in length, eighteen inches wide at the top, one foot wide at bottom and eighteen inches deep, should be fixed round the two lighted sides of the room. Each trough should have a hole and stopper in the bottom, and close under

these holes should be a gutter, common to all the troughs, which may convey away the waste water to the manure tank. In one corner or side of the room the boiler should be placed, and over it a supply pipe from a cold-water cistern. Pipes may be conducted from both the cold-water cistern and the boiler, so as to deliver, on turning the faucets, cold or hot water, at pleasure, into each trough.

"The floor of every wash-house ought to be very carefully paved, with an inclination of an inch to a yard toward one corner, in which there ought to be a trap drain leading to the manure tank. This inclination, which will hardly be perceptible to the eye, or recognized in standing or walking, will yet be most useful, by directing all the water which must occasionally be spilt on the floor to the point where it will be carried off. Close under the ceiling there should be several openings communicating with the outside air, to carry off the steam, and in the bottom of the door there ought to be corresponding openings to admit fresh air. Both openings should have shutters sliding in horizontal grooves, with hooks in them, so as to admit of their being easily drawn back or pushed forward."

Pomological.

THE HUCKLEBERRY.

Our readers must remember how often in these columns huckleberry cultivation has been urged. We read with pleasure an essay upon this wholly neglected fruit, read before the New Jersey State Horticultural Society, by Mr. C. W. IDELL—extracts from which we give below regretting that our space prevents its entire publication:

While Horticulturists are busy propagating and introducing new varieties of fruits, I leave it to them to sound their praises, while I call your attention to one of our own natives that has been neglected, yet in quality is far superior to many species they have been enthusiastically extolled as being the perfection of rich and desirable culture. I have never known this fruit to be cultivated or the least attempt made to bring it under the bonds of civilization, although many writers have concluded it could be done. The fact is, God has distributed this little berry too freely over our State for us to appreciate its excellence and possibility of improvement.

Strawberries once grew wild only, but in such limited quantities that in order to supply the demand they had to be cultivated; the same with the blackberry: only a few years since a cultivated blackberry was unknown, all were found wild in the woods or fields, yet as the demand increased the supply decreased, and only through a course of experimental cultivation the Lawton, Wilson, Kittatinny and Dorchester were discovered, and sent forth to gratify the palates of all lovers of these fine varieties: but the huckleberry has been neglected to such an extent that it is known only by the botanical names of its genus and several species, and the rude, common names given by the inhabitants of the country in which it grows.

On looking into the history of the fruit, we find that it grows wild in many countries beside our own. It is found in the mountains of Scotland at an elevation of 4,000 feet above the level of the sea, and is a native of Northern Europe, but these are of kinds sparingly found in this country, if at all, none of our market species being known in Europe.

In this country they are widely diffused from Canada to the mountains of Georgia the common name among the country people, and in the market, is huckleberry; but some fastidious persons think this is vulgar, and a corruption of whortleberry, which they regard as the polite name—not being aware that this is itself a corruption of "Myrtleberry," the name by which the fruit was known in Europe in early times, so we have myrtleberry, whortleberry, hurtleberry and huckleberry, one being quite as correct as the other, but general usage has hit upon the most easily spoken—huckleberry. The Saxons call it the hurtberry, the Germans heicle, or heathberry.

The twigs and bark are astringent, and have been used for tanning. The bark is slightly stimulating. Spirits of a high intoxicating nature have been made from the fruit. A very pleasant drink can also be made from it; and I once gave some of the juice to a manufacturer of medicated wines, to test and compare with the blackberry, and he informed me "that he considered it far superior in its medicinal qualities." Leaving aside the general and specific peculiarities of this good and useful berry, I will confine this article to our own State in order to condense and make it more instructive and interesting.

The first to ripen are those borne by bushes about two feet high. These grow on the higher and dryer portions of the land, and some say that when the surface is rolling the fruit attains larger size. These are a small sweet blue berry, and are covered with a fine bloom, and being hard carry well.

The "swamps," so called from their growing in the swamp lands referred to, ripen next in order, and are the largest and richest of all varieties. Some of them grow as large as the common black-heart cherry, are sweet, and very juicy, and are also covered with a bloom equal to that which covers the Concord grape. They are very tender in their richness, which causes them to carry badly.

The next in order of ripening is the common variety, with which you are mostly acquainted; it is medium in size; color, light blue; sweet; without bloom, and is a good marketing berry.

Another variety is medium in size; very hard; black and glossy and is known by the name of "Cracker." It has a tart flavor, and full of seeds, which crack as you eat them, hence their name. They are not popular with the native consumers, but owing to their solidity they are sought for by the shippers of this fruit to send to distant cities, where they do not have the privilege of selecting other and better kinds.

A later variety is called the "Bill," or "Dangleberry; they are large; of a bright blue color, slightly acid, and quite juicy; they grow on long stems, hence their name "Dangle."

The peculiar feature of the fruit is, that when picked with the stems on, they keep dry; but when separated, the juice oozes from the berries, and in warm weather soon sours them.

The latest variety is called "Shiny Blacks," on account of their being so glossy. They are a trifle tart, but large and possess a good flavor, and last until the frost destroys them.

While I have called your attention to the leading varieties, and the names by which they are known, I believe that many others might be found by a close observer.

This fruit begins to ripen by the first of July, then a succession of ripenings take place the entire season until killed by the frost.

The first arrival of huckleberries in the New York market is eagerly sought for, and is frequently sold from $10 to $12 per bushel; but as the quantity increases the price gradually declines until it reaches $4 per bushel, when large quantities are received and sold at this price, and were it not for the interference of other fruits, I question if the price would fall below that figure; but a large crop of peaches seriously interferes with them, as well as all other kinds of fruit.

Permit me to call your attention to other items of interest connected with the gathering and shipping of this fruit before it enters the market for consumption. As the fruit grows wild, all are free to go when and where they choose to gather it: consequently thousands of persons, mostly women and children, find it a source of much pecuniary benefit.

Mr. David Rogers, of Cedar Creek, Ocean county, New Jersey, a veteran carter, to whom I am indebted for much valuable information, informs me that he knew of a family of seven persons, mostly children, who made $25.00 per day for two weeks in succession by picking berries, and quite a number of girls to make $5.00 per day; and it is a very common occurrence for a mother with her family of from five to six children, to gather from three to five bushels per day. Of course, the receipt of each was in proportion to their market value, yet in the early part of the season they frequently sold their berries at from $5.00 to $6.00 per bushel. Now, what these persons did, others could do also; and it shows conclusively, that a large amount of money is yearly earned by these people by picking this fruit.

In an interesting letter from Mr. Rogers, he says:—"If you wish to see a happy set of laborers, take a ride with a carter through his district when he goes to gather berries, and see the group of smiling, happy faces, that crowd around the wagon to exchange their berries for the money, for you must understand this point—they don't trust. True, they look happy, and are, but many of them dress in unique if not beautiful style, but their dress is adapted to their work, and when you see these young women with torn dresses, or perhaps with a pair of pants on, made of strong drilling, you would not realize that they were the same beautiful girls that you saw on Sunday at church, dressed in the richest of silks, as closely pinned back as any Broadway belle; yet they are the same, and they are the women whose price is above rubies, many of whom now adorn the homes of men of wealth and refinement."

As the fruit is scattered over such a large surface of country, the mode of gathering and marketing it is peculiar. It is done by a class of persons called "Carters." Previous to the ripening of the fruit, these men provide themselves with a number of boxes, which contain either eight or sixteen quarts each. The sixteen-quart boxes are made without lids, but have a narrow strip across the top, in order to prevent one from dropping into the others and damaging the fruit; at the same time it answers as a handle to the box. The eight-quart boxes are generally packed in skeleton cases, with lids, each case containing either four or six boxes. When the fruit is sold these boxes are returned to the shipper, to be refilled.

In the beginning of this shipping business they made use of any ordinary box containing from 16 quarts to one and a half bushels, and occasionally three bushels would be sent in one package; but this system necessitated the measuring of the fruit, which in time created dissatisfaction among the shippers, owing to the shrinkage in the measure reported as sold, from the quantity sent; gradually the present system was introduced, and the two kinds of boxes are now used by all the large shippers in the State.

These carters select a portion of the "Pines," which they call the route and meet the pickers at a named point and at stated hours, and buy their fruit. The plan is adopted for the convenience of both parties, and it saves time and fatigue to each; yet these pickers are not so isolated that they cannot or do not learn the price paid by other carters.

When the carter has gone his round and gathered his load of fruit, he proceeds with it to the nearest depot, and ships it to market, where it is generally sold by the box, not measured, as that would injure it.

Persons accustomed to go into the woods and pick these berries for home consumption, cannot bear to eat them after they reach the cities, on account of their being "mussed." I know no more appropriate word for the condition they are in, for they are not mashed. I do not wonder at them; but when we consider the jolting and handlings they receive, you will not be surprised. Let me, at the close of this article, call your attention to these changes, not merely out of curiosity, but to show you why fruit should be handled more carefully by transportation companies than it is. First, the pickers place them in their baskets; then they are measured, turned out in the boxes of the purchasers, then carted around over roots and stumps, until all are loaded, then to the depot, where they are placed in the cars, then on the boat, then on the dock, then on the carts, taken to the store, where they are again placed on the wagons, to be carted over the stones of the city. These are the least of the handlings they receive, for in many instances they are re-shipped to other cities, to undergo another series of changes of like character.

In conclusion, permit me to say to you, gentlemen, fruit growers of New Jersey, that I think it will add largely to your credit, and to the honor of the State, to take a greater interest in this fruit, which adds so largely to the wealth of the sections in which it grows; and if this paper will be the means of calling your attention to it, I shall feel myself amply repaid for my efforts in their behalf.

AN EARLY PEACH.—From a tree on our grounds we picked a ripe peach of the Beatrice variety on the 12th of July. Can any one beat this for earliness? The peach is very showy and delicious.—F. K. PHŒNIX, *Bloomington, Ill.*

Around the Republic.

IN OLD CONNECTICUT.

DEAR RURAL: If you will look on a map of Connecticut you will see, midway of the State, longitudinally, and but a little below its northern limit, a township, denominated "Bloomfield," but why thus named, it passeth the knowledge of man to tell.

When your correspondent was yet a lad—endeavoring, in the schoolhouse on the hill, by the aid of masters and mistresses, variously as the seasons changed, to fathom the mysteries of Webster's Elementary Spelling-Book—that territory had not attained the dignity of a town, but was divided between and formed portions of the towns of Windsor, Farmington and Simsbury. Separated from each and all of them by high hills or sandy plains, the inhabitants were permitted, for church government, schools, etc., to act by and for themselves, and were constituted a parish, to give name to which, each of the towns aforesaid contributed a syllable, which in the aggregate made Win-ton-bury, a name with a reason for it, which there is not for the present one, nor for those of half of the places in the State for that matter.

There are a few exceptions near at hand, as Tariffville, a manufacturing village, established when a protective tariff aided American industry in that line. Rainbow—from a curve in a river. Spoonville—where spoons were made, and a few others. But here, as elsewhere, names, copied from other places without a show of reason, or given in hopes of perpetuating the name of some man, predominate. They may be more euphonious and high sounding, but a name with a reason is far preferable, though it be as outlandish as Burnt Corn, Bad Ox, Sorrel Horse, or Shoe Heel, all of which designate post-offices in the United States.

Perhaps I say too much about the name; but I was born in Wintonbury, and in Wintonbury got my start toward manhood, and now, when I come back to the old homestead, after many years, it seems as if it would be better if I came to Wintonbury instead of Bloomfield.

But the people have changed as well as the name, and now I find, within a radius of half a mile, in a population of nearly two hundred, but two who lived here forty years ago. Many have died; many have gone away. Girls have followed the fortunes of husbands not to the manor born; and boys have sought fame and fortune in other lands. Their native soil offers little inducement for them to remain; but the business circles of our large cities and the rich farming countries of the West show that industry and enterprise were not wanting, and that larger fields gave opportunities not to be found at home which were not neglected.

Than the Connecticut River Valley, of which Bloomfield forms a part, none lovlier can be found. And than this no better specimen of a quiet inland farming town need be looked for. A few houses, amid which are churches, stores, shops and the Rail Road Station, constitute the village, which occupies nearly the geographical center of the township. The remainder of its population, numbering about fifteen hundred, are scattered over its whole extent. As a rule, all are farmers, and each owns and cultivates his own farm, which is usually comparatively small, and the township is so completely interlaced with roads as to suggest to a stranger that every man has his own private drive-way to meeting.

I propose to ruralize here a few weeks, and in leisure moments to indite epistles, which shall speak of men and things as I find them in this, to me, most beautiful section of beautiful New England.

L. A. R.

Bloomfield, Conn.

MORE PRAISE OF KANSAS.

UNDER this heading are some very pertinent facts following Mr. B. M. HOUSE's remarks.

In addition to their and your exposure of the toilers who "sit in the shade," etc., allow me to suggest that "the broad acres spread out for man's benefit, running to waste," had far better remain in their untilled condition, at least three-fourths or more ought to be held sacred from the plow, and, instead of being ruthlessly despoiled by men who run over all the best land, cropping year after year and giving no return, it should be in the possession of men of capital, who would keep all the fine grazing portions for raising and fattening mutton and beef, for growing wool and making butter, too, if it was found the prices paid equally well with production of meat, and horses could likewise be a proportion of the live stock raised.

Here, in the East, the former virgin soil of al the most fertile valleys and best uplands have been "subsoiled," and so ignorant are some land owners of the necessity of having soil full of plant food and rich and strong, that in advertising their farms they say, as a recommendation, the new land has been subdued, and then in an other part of the paper, where the weakened soil has been lauded, there will be some farmers bewailing the unsuitability of the country for permanent grass, and others complaining that some rough hillside pasture is good for little.

Common sense, if brought to bear on the subject, will explain the matter thoroughly, as any one can know, by inquiry, that all the fine meadows and rich pastures in England are in the best districts, where, under no circumstances, no excuses or misrepresentations, can the plow be brought into use for turning the sward (sod) under—the farms are most valuable which have the greatest proportion of old grass land on them. The arable fields on a large farm, where there is much more permanent grass in comparison, are always in a fertile state, as they are helped by receiving more manure than is their due, whereas, to hear what Americans say and see what they write, one would suppose grass land, perpetually kept in pasture or for mowing, was kept up at the expense of the plowed portion of the farm.

If Kansas land, which Mr. B. M. HOUSE describes as running to waste, was held by men of means, who would raise meat, wool, etc., on the natural grasses which fatten the buffalo and the deer, and the "hardy yeomanry," debarred from tilling what is already like the blue grass regions of Kentucky in condition to make meat, etc., without costly cultivation, it would be much better for the future of this run-down and impoverished country.

Here, in Kansas, are millions o acres where the grass is wasted for want of stock to eat it, while in Eastern States, are farmers who won't believe there is any permanent grass in the States or on the continent, and who represent that the grass lands of England are kept up and supported by the plowed portion when it is notorious that the contrary is the case, and I here distinctly deny that pastures are usually or generally manured, or that plowed land is robbed for them.

W. F.

Dairy Husbandry.

CHEDDAR CHEESE-MAKING AT FACTORIES—THE ENGLISH METHOD.

Those who have kept the run of our English market reports will have observed that English cheddar cheese is quoted regularly from 20 to 30 shillings sterling per hundred weight more than the best American factory. This is a wide difference, amounting to from 8 to 9 cents currency more per pound for English cheddar than for extra fine American.

The history of manufacturing our factory cheese will show that step by step as we have adopted particular features of the cheddar system our cheese has been improved in texture and flavor and is more suited to the English markets.

England doubtless has some advantage over us in climate and the better condition generally of milk for manufacture, but as our knowledge of requisites in cheese making is increased, these should teach us how to overcome the disadvantages named.

Mr. John Oliver of Derbyshire, England, who has been visiting us, says he thinks as good cheddar cheese can be made in this country as in England. He managed a factory in Derbyshire, England, last year, making his cheese on the cheddar plan and selling it at a greatly advanced price over that made on the American plan, and he has proposed to test his views by making a few cheddar cheese at our factories in Herkimer County, and thus by forwarding the goods to England in connection with the best cheese made on the American plan, at the same factory, allow the difference, if any, to be determined in the English markets. In our interview with Mr. O., he kindly furnished us with notes upon cheddar cheese making at factories, from which we make up the following points:

THE NIGHT'S MILK

is delivered and put in vats—about half the quantity in each that will be required for it when set for coagulation. Then set the agitator at work and turn on cold water around the milk, cooling it down during the night to between 60 and 70° Fahrenheit, according to the state of the atmosphere. The aim of the maker should be to regulate the cooling by the indications of the thermometer used for giving the heat of the air in the manufacturing room. If the latter shows a high temperature, cool the milk to a lower temperature; if low, cool the milk less, using less water, or using it a shorter time.

IN THE MORNING DELIVERY

the rakes (agitator) should not be removed from any vat until the whole quantity of milk for that vat is in it. The mixture of morning's and night's milk may be left—if time is not a matter of consequence—for a longer stirring with the agitator, exposing it to the air. It is clear that to rob the milk of animal heat and odor by exposure to the air is necessary or accessory to the production of a fine flavor in cheese. If it be practicable, let the milk both of morning and evening be carried from a weighing-can on an elevation of 8 to 10 feet and allowed to fall a distance of 4 or 5 feet into the vat through a strainer. If this latter be done, the former suggestion need not be carried out. Now remove the agitator and heat the whole mass to from 78 to 82° F.—this also being regulated by temperature of manufacturing room, stirring the milk all the time with a breaker, not violently, but sufficiently to expose it to air and prevent cream rising.

RENNET

is now added, and in the use of rennet the golden mean should be obtained—neither too much heat and not enough rennet, nor too much rennet and not sufficient heat, the action of each being totally different in character.

SOUR WHEY

is also added—this depending upon the state of the atmosphere and season of the year, less being used in summer than in spring and autumn, as acidity originated by using sour whey is developed more rapidly by heat than in cold weather, though more applied heat will not produce in the milk the same change as sour whey. The amount used ranges from one quart to two or three gallons for every five hundred gallons of milk under different circumstances. No general rule can be given.

IN COLD WEATHER

it is well to cover the vats at this point with cloths, to assist the coagulation, though the cloths should not be thick or very close in texture, in order that the air may have fair access to the milk, the cloth acting like a respirator.

THE WINDOWS

should be closed if near the milk and no heavy draft of air be admitted at this stage, nor, unless in summer, should they be opened again until the commencement of the cooling process. The room should be ventilated by small louvres near the ceiling and as far removed from the milk as possible, the aim being to preserve the air fresh and cool without permitting it to influence by retarding the developing process in the manufacture. At the expiration of from 45 to 60 minutes the curd should be formed and fit to operate upon.

THE CHEDDAR KNIFE

is now used. It differs from the American knife, there being but two blades set six inches apart. The curd is cut across in square checks of 6 inches each way, and no horizontal knife used.

THE SKIMMING DISH,

which resembles somewhat a common skimmer, now comes into use. With it the blocks of curd are turned over very slowly, causing them to split into small pieces and cutting as little as possible. The use of this instrument and the breaker must be learned by practice and oral instruction. After going over the whole vat two or three times, gradually increasing in speed, the skimming dish is laid aside and

THE CHEDDAR BREAKER

is brought into use. This is a shovel-shaped implement, with a long handle, the part corresponding with the blade of the shovel being of wire, passing through a light frame of steel with sharp edges. The breaker is held at first in a slanting position and worked slowly about, being careful to keep it under the surface for some time after starting and gradually increasing the speed according to the state of the curd. If the curd is getting too hard, the motion of the breaker should be quicker, but if there should appear a danger of white whey, its action should be slower.

The old rule—a reliable one for the prevention of white whey—is that the cheese maker should be able to see the reflection of his figure in the whey;—as long as such is the case there need be no fear of a white whey. After breaking the curd down to the size of large peas, the steam is applied and

SCALDING

commences, the breaker now being turned over to scour the bottom of the vat and prevent the curd from sinking. The heat should be gradually applied and at the close of the process be of from 95 to 100° F., this being regulated by the state of the curd and atmosphere in summer. The scalding need not be so high as in the colder season, as the after stirring, being prolonged, completely separates the whey, and if a greater heat was given to the mass, the acidity would develop too rapidly when the curd is piled.

THE AFTER STIRRING

is for the complete separation of the whey, and is continued until the curd feels "shotty" or powdery, and when rubbed between the fingers does not adhere, but rubs apart in small particles and feels dry. It must also have no free cream. If there is any, under ordinary circumstances it will come out on rubbing or squeezing it, and a little more stirring must be given. When stirred sufficiently, it then is allowed to sink to the bottom of the vat under the whey and acidify for half an hour. Then the whey is drawn by a siphon and the curd piled in a mass at the top, or upper end of the vat. On cold days it must be covered, to assist in keeping in the heat and aid in developing the acidity, but if fairly warm, it is much better without. After lying for about a quarter of an hour the mass is cut into two or three large blocks and turned over, in order that it may drain further and allow the upper and more exposed portions to acidify also. When the acidity is sufficiently developed, which is entirely a matter of judgment and experience, cooling begins.

COOLING.

The curds are now torn or cut in large lumps and laid on the bottom of the vat to drain. After a short time, when the outside of the curds is getting dry, they are torn in halves and spread again. Soon after they are put on the drying boards, which are arranged on the tops of the vats, and torn in smaller pieces at short intervals until the sheets of curd are about 6 or 7 inches square over the surface and an inch or so thick. When a fine, brown tinge comes on the curd and it is dry enough, it must be ground in a mill and salted at the rate of one pound of salt to fifty-six gallons of milk or pounds of curd and put to press.

PRESSING.

Here it remains until the following morning, when it is bandaged and returned to press and remains under pressure until the second morning, when it is taken out, ironed over the surface with a hot iron and sent to the curing room to cure. It will take about six weeks with a fair temperature (70° F.) to cure. Ironing cheese has its own peculiar virtues;—it makes it "fly-proof," hardens the rind slightly, and yet leaves the rind free to perspire, which is an important requisite in the curing process.

Since writing the above we have had another interview with Mr. Oliver, who has been testing the cheddar process as above described at some of our Herkimer County factories. He says the milk of Herkimer contains more solid elements than that of Derbyshire, and that he is enabled to make a larger proportion of curd from a given number of gallons than he can from English milk. He reports that he is able to work the cheddar system here to his satisfaction, and he believes the cheese made on this system will command a much larger price in England than that made after the usual American plan.

The subject discussed will be of interest to dairymen, and we ask from them a careful reading of what we have written.

MILCH COWS IMPOVERISHING PASTURES.

There must be a deal of ignorance, misapprehension and misrepresentation on this subject, for I am well acquainted with thousands of acres of grass land which have been grazed by cows, from whose milk butter has been made, without having experienced the slightest deterioration—in fact it has improved in many respects, and has never been manured or dressed by any fertilizer, but on the contrary has largely contributed in helping to fertilize the arable parts of the farms in more ways than one. For instance, every autumn, or during the open winter season, the bunches of coarse grass, the ant hills and every tuft of herbage not looking as it should do are cut out of the sward, and carts come round and take all this matter to make bottoms for dunghills on the plowed land, to be afterward mixed up when the heaps are turned over, as all manure is in England before being applied; also, where the dairy fields have been brought to a fine, even face and the surfaces require no clearing in the way stated, carts will go around and take away the droppings, which are picked up with a fork and thrown into the carts. In my time, I am ashamed to say, I have seen these cakes of dung hauled to the homestead and used as fuel in the back kitchen of the farm house.

The land I am alluding to lies from Banbury, Oxfordshire, to Daventry, Northamptonshire, and from the latter place on to Newport-Pagnel, Buckinghamshire, and the burning of the cow dung I witnessed between Aylesbury and Bicester. None of this land has been plowed for more than a hundred years, and some of it for a much longer time, though a good deal of it has been plowed some time, as is evidenced by the ridges of the lands, which vary in different localities from 11 to 15 yards in width, and are 3 or 4 feet higher at the ridges than at the furrows, in consequence of the old practice to plow one way.

I have farmed grass lands, etc., in the cheese-making districts of England, also, and have dairied for fourteen successive years on a fine estate, where the finest of double Gloucester cheese was manufactured, and I sold the cheese, six tons at a time, in market at Stow-on-the-Wold. The pasture on which I made this cheese had been in grass, without any plowing, since 1632—two hundred years, and perhaps longer—and that had not run down, but was so rich that the grass grew very heavy. Many nettles also grow among the grass, and to cause their destruction I mowed and made hay in alternate years, cutting three tons of hay per acre and mowing the first week in June; and this alternate mowing and grazing did not injure the set of grass, but improved it, although no returns were made in measure, excepting by wintering part of our flock of breeding ewes upon it, for it is customary to clear up all the grass left by the cows when they are put in the straw yards or placed in the cow stables for the winter. Some sheep racks are moved about the dairy fields and a little hay given early in the morning.

As some Englishmen are scattered here and there over the United States, and a few have been in the agricultural districts and witnessed the dairying there, it would be easy for any one to satisfy himself by inquiry about the permanency of the dairy fields, which are all old, long-ago-established grass. But it is not general to mow a dairy field, and is seldom done, as mowing will reduce the fertility, and very much so, if the grass gets old before it is cut. In the case mentioned by me, the grass was mowed so very young that it had not fed much on the soil, gaining its chief support from the atmosphere, and then the ewes which lay on the grass in autumn and winter, eating hay at daybreak, returned more in their droppings than they took from the land in grass.

In questions of this kind argument should be cool and with a view to get at the truth, not to support one set of men's ideas nor another's theory; and here I would call on every fair, honest mind to think whether it is not generally admitted and if he does not himself believe that herbage, up to the time it commences to form seed, takes very little from the soil; therefore, in grazing, if it can be cropped off without ripening stems or seed, the fertility is not decreased, and all the manure voided by the animals adds to the plant food, so that instead of the land being impoverished it annually becomes richer. But look at the case if the grazing is done in the accepted American way, where half the grass is left to ripen and thus suck the fertility out of the ground, and the dung and urine which the cattle would drop on the land while eating this moiety of the herbage is lost, thus robbing the soil, and the dead-ripe old thatch makes the pastures look very bad, besides which the cattle do not leave it regularly, and the thick mass in places, instead of benefiting the set of grass by shade, completely kills all the fine, shorter grasses, just as heavy crops of sown herbage are known to smother and totally destroy weeds. Thus all the sweet dwarf grasses which make a network of thick-set bottom grass, and which, though not two inches high, shade the ground ten times more effectually than the tall grass, is destroyed and the bare ground exposed between the thinner set roots of the timothy.

A pasture grazed according to the practice in the United States and one according to the prevailing custom in England puts the contrast as strong as that between two pieces of wood land—one from the tall trees has nothing under, and from tree to tree all is bare and harsh, no dews, no damps. On another piece of wood land indiscriminately cut off and kept down there is such a thick-set brush that it is one mass of living, green, tender twigs, etc., through which the rays of the sun cannot penetrate nor the air circulate fast enough to dry the soil. Thus under this thick dwarf herbage there is genuine shade, and the bluish-green leaves, twigs and stems, full of sap, are in striking contrast to the bare, withered-looking surface under the tall trees.

The ridiculous custom of yarding cows at night is a great injury to a pasture, because of the loss to the land in the manure thus taken away, and then in this country sheep are put on the pastures and fetched up at night, and often driven home out of the rain, so that pastures are robbed enough, without reckoning the butter and cheese as coming from them.

The fact is, there is no genuine, old, natural pastures in the Eastern States on land suitable for rich grass; and in the West, directly the timber is all cleared off and the blue grass, with other natural varieties, begins to flourish and gives evidence that it would make a permanent green sward that would not run out, the owners plow it up and crop the land with corn and wheat, till the soil is unfit for making the kind of pastures which will bear breeding and grazing at any season and will not run out under the roughest usage.

A Working Farmer.

THE CITY MILK TRADE.

On the authority of the New York Herald, the milk dealers of New York have entered into a combination to advance the price of milk and are charging twelve cents a quart for it to consumers, while the producers or farmers who furnish the milk to the dealers get only four cents a quart. This is an abuse which ought in some way to be remedied. We presume that no one will object to the dealers making a fair profit in their business, but a difference of eight cents per quart between the purchase and sale of the article is evidently a monstrous abuse upon a large number of persons in New York who cannot well do without milk and who find it difficult to provide the necessaries of life from day to day. We shall not argue in this connection that a considerable portion of this difference between the purchase and sale of milk should go to the milk producer. The farmer does and will complain that four cents per quart is small pay for producing milk, and it must be confessed the profit is by no means large. Still, when the low price of dairy products is considered, where the cheese dairyman realizes only about two cents per quart for his milk, the four cents obtained by the milk farmer would seem comparatively large, and from which a fair margin could be saved above expenses.

The city milk trade, as now managed, is not to the advantage of either farmers or consumers. Both parties are made to suffer, and the only relief to be hoped for is in an organization among farmers whereby the business of selling directly to the consumer may be inaugurated and controlled by the farmers themselves.

We hope, therefore, that the proposition by the milk producers of Orange County to combine and purchase wagons and sell milk in opposition to the present dealers in New York will prevail. Even if the farmers obtain no more for their milk than the present price, such an organization and movement on their part would be to their advantage, because in the present state of affairs they are under the complete domination of the city milk dealers, who dictate prices, make deductions for milk spoiling on their hands, and practice other impositions from which there is no escape single-handed. Let consumers be charged fair prices, but extortionary rates should be resisted and put down in the way proposed.

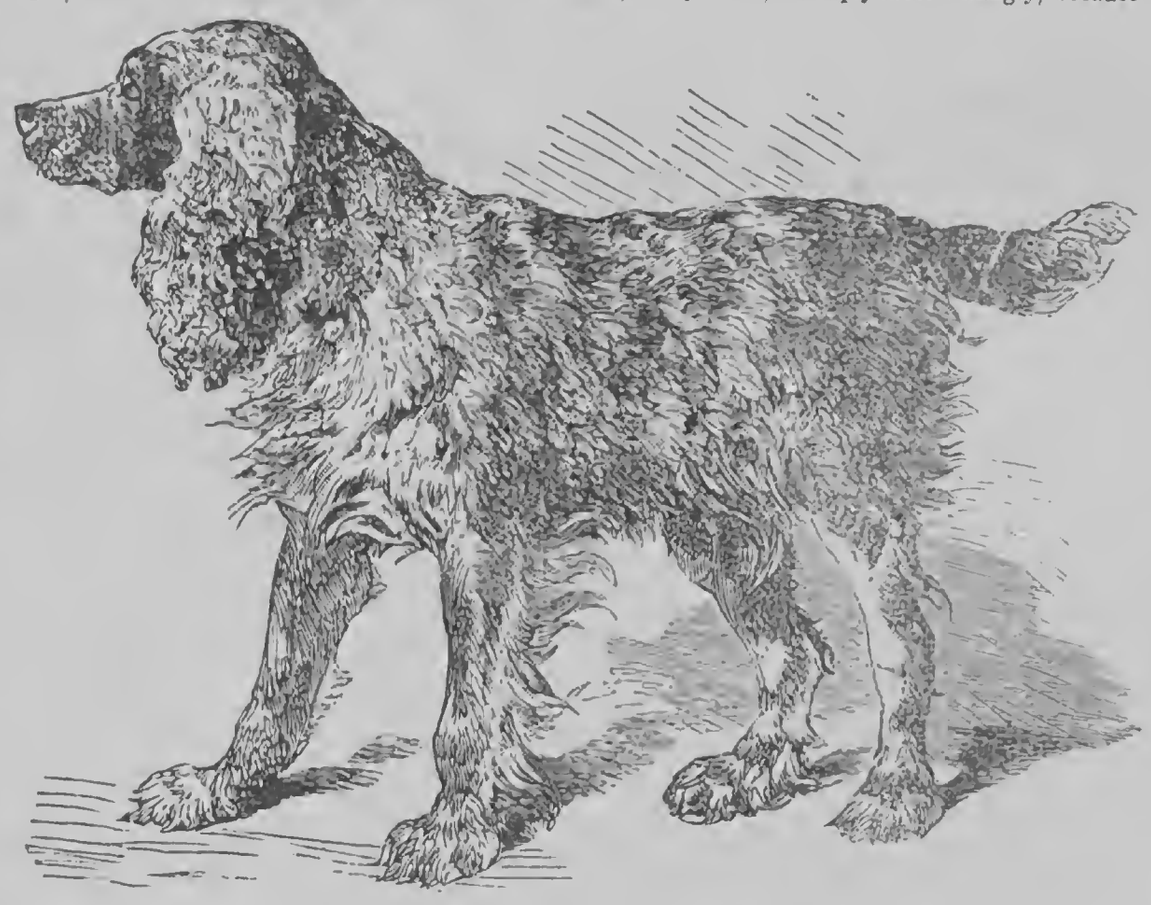
Milk in August.—Pastures are usually short during the month of August, and if cows are not fed extra the flow of milk will be correspondingly lessened. It is much easier to keep it up by feeding than to restore it after it has decreased to any considerable extent.

The Naturalist.

HYDROPHOBIA—THE SPANIEL.

It will scarcely be denied that the dog is one of the most, if not the most, affectionate of the lower animals. He loves his master. There is no other animal half so affectionate—half so kind to children—half so companionable to man. Were it not for the bane of hydrophobia, dogs would be generally welcomed in this their legitimate place. That dogs are liable to hydrophobia, we have no wish to dispute; but that the disease exists to the extent that many suppose who, disliking dogs—indeed all animals in the shape of pet companions—have no interest or desire to believe otherwise, we greatly doubt. One of the meager but sensible conclusions of the excited, desultory and hasty investigations made several years ago when, it will be remembered, hydrophobia, its cause, cure etc. created the liveliest speculations, seems to have been that only dogs left to take care of themselves—only dogs wholly neglected; alive with vermin, half of the time without food or drink, were ever attacked with this terrible disease. We need not discuss this. Certain it is that the whole race of dogs, however useful they might be made to man—however faithful and intelligent as companions, are held in light esteem because of the exceeding dread which the very name of hydrophobia engenders.

Among those dogs that are the least liable to rabies, the correct name for this malady,—among those strongest in their affections and fidelity to child and man; among those the most courageous and serviceable as watchers as well as the most tractable and docile is the Spaniel—a life cut of which we give herewith.



THE SPANIEL.

There are worthless dogs—aye, worse than worthless, and among them we class the sickly, yelping, lawless, untidy poodle that how high soever the periodical fever against dogs in general may rage, is ever as safe as "a bug in a rug" under the affectionate wings of his adoring mistress. We wish, too, that every savage, untrained dog that runs about the farmers' grounds to bark at one, to snarl at or bite another, might be shot, hung or drowned. But, good reader, while the poodle and snarling cur are tolerated, we presume to speak a good word for the spaniel—for the setter and pointer—for the Newfoundland—for *any* dog that is capable of being taught sufficiently to reveal noble instincts and qualities and to prevent him from resembling too closely the poodle on the one hand and the untutored, ferocious farmers' cur on the other.

We need not beg the farmer to change this; to procure spaniels or other intelligent dogs and to train them so that they may become, as it were, guardians and companions of the family and *not* the pests of the neighborhood. The farmer in some things is very set. But we will say to the ladies that there is no living animal that is demoralized hopelessly by their caresses except the poodle and that they, therefore, put to a bad use that which is conducive to unqualified and unlimited good when lavished upon more appreciative objects!

TAMING THE HUMMING BIRD.

Humming Birds are usually exceedingly delicate therefore quickly killed if handled at all roughly. But while few will succeed in trying to tame them we are pleased to know that it has been done—at least so says the Popular Science Monthly.

The ruby-throat has sometimes been tamed. Mr. Webber, in his "Wild Scenes and Song Birds," says, after several unsuccessful attempts, at last "I succeeded in securing an uninjured captive, which, to my inexpressible delight, proved to be one of the ruby-throated species, the most splendid and diminutive that comes north of Florida. It immediately suggested itself to me that a mixture of two parts of loaf-sugar, with one of fine honey, in ten of water, would make about the nearest approach to the nectar of flowers. While my sister ran to prepare it I gradually opened my hand to look at my prisoner, and saw to my no little amusement as well as suspicion that it was actually 'playing possum'—feigning to be dead, most skillfully. It lay on my open palm motionless for some minutes, during which I watched it in breathless curiosity. I saw it gradually open its bright little eyes to peep whether the way was clear, and then close them slowly as it caught my eye upon it. But when the manufactured nectar came, and a drop was touched upon the point of its bill, it came to life very suddenly, and in a moment was on its legs, drinking with eager gusto of the refreshing draught from a silver teaspoon. When sated it refused to take any more, and sat perched with the coolest self-composure on my finger, and plumed itself quite as artistically as if on its favorite spray. I was enchanted with the bold, innocent confidence with which it turned up its keen black eyes to survey us, as much as to say: 'Well, good folks! who are you?' By the next day it would come from any part of either room, alight upon the side of a white China cup containing the mixture, and drink eagerly, with its long bill thrust into the very base. It would alight on my fingers, and seem to talk with us endearingly in its soft chirps." Mr. Webber afterward succeeded in taming several of the same species. He gave them liberty occasionally, and they returned regularly. At the time for migration they left for the winter; but the next spring they sought their old quarters, and accepted the delicious nectar kindly provided for them, and by degrees brought their mates.

DIFFERENT TYPES OF THE REINDEER.

Mr. Lamont, an English sportsman and member of Parliament, who has made many summer yacht voyages to the arctic seas, says that the reindeer in Nova Zembla is much larger and wilder than in Spitzbergen, and he is disposed to believe that the smaller and tamer variety found in the latter island is allied to the reindeer of Norway and Lapland. As these animals are noted for their wandering habits, Mr. Lamont conjectures that they may have made their way originally into both islands from the continent, over seas not usually frozen, but which then happened to be so. It is a curious fact, however, that although Nova Zembla is much nearer the continent of Europe than Spitzbergen is, the reindeer there are of the wild and large American type, while those of Spitzbergen more nearly correspond to the European variety.

INTELLIGENCE OF ANIMALS.

The exaggeration of the alleged intelligence of animals has called forth some severe criticisms from Mr. St. George Mivart, F. R. S., an able writer on evolution and kindred topics. Although an advocate of the evolution hypothesis, he refuses to regard the higher nature of man as having been developed from the mind of brutes. An examination of Mr. Darwin's cases, showing to the satisfaction of that eminent naturalist that brutes possess reason, fails to convince Mr. Mivart. On the contrary, he thinks them wholly without it; and a strong argument is drawn from the fact that those animals which most resemble man physically, are by no means mentally most like him. Thus, dogs, horses and elephants are quite as intelligent as the gorilla. Attention is also called to the fact that greatly as dogs enjoy the heat of a fire in cold weather, and frequently as they see wood put on to maintain it, they never put any on the fire themselves, though usually quite able to do so.

SALT IN SEA WATER.

Prof. Chapman of University College, Toronto, has published an interesting paper on the "purpose" of the saltness of sea water. After giving reasons why he does not accept the usually received opinions, he urges the theory that the object is to regulate evaporation. If any temporary cause renders the amount of saline matter in the sea above its normal value, evaporation goes on more and more slowly. If the value be depreciated by the addition of fresh water in undue excess, the evaporating power is the more and more increased. He gives the results of various experiments in reference to evaporation on weighed quantities of ordinary rain water, and water holding in solution 2.6 per cent. of salt.

Industrial Topics.

THE POLITICS OF AGRICULTURE.

BY F. G. SKINNER,
Field Editor of the Turf, Field and Farm.

Ed. of Rural New-Yorker:—Having honored me with a request to write for your excellent journal, I comply most willingly, because I have always held the Rural New-Yorker to be among the very ablest papers in its special field, but I find a difficulty in the way. Though I have been more or less intimately connected with the agricultural press ever since my father, the late John S. Skinner, founded the American Farmer, just fifty-six years ago, I am somewhat at a loss for a subject, unless I venture to run against and perhaps wound what seems to me the deep-rooted prejudices of almost every journal in the country devoted to rural pursuits. It does appear to me that in their anxiety to secure patronage, most of these journals have renounced their independence to become a species of political hermaphrodites, for while they pile up precept upon precept on the best modes of fattening bullocks and hogs and the cultivation of field crops, they avoid, as they would the pest or the murrain, any allusion to what we will call the politics of agriculture, for fear of losing the support of the political partizans on one side or the other. A majority of our farmers will leave their plows to rust in the furrow and neglect their own affairs, and work with a zeal, which, properly directed, would insure their fortunes, to secure the election of some political partizan demagogue who has no interest in common with theirs, and who thenceforth becomes their master, and yet it is as evident as the noonday sun, that the legislation of the country, both State and Federal, is controlled in the interests of all great industries, except in those of that, greatest of them all, the agricultural industry.

It cannot be denied that the law-givers of the country are the creatures of the great railway and other corporations, the iron masters and the mill owners, and that to these, mere vermin upon the lion's mane of agriculture, the ignorant or careless farmers are mere hewers of wood and drawers of water.

The American journals devoted to rural economy are exceedingly numerous, and many of them are conducted with marked ability. Nothing of value to the cause they represent, either abroad or at home, escapes their vigilance. Through their advocacy the powers of steam have been made tributary to agriculture. The reaper and the mower, and the tedder and the horse rake, and many other toil-saving implements have come into general use, and our advance in all the processes of cultivating the earth has been prodigious; but has the average production per acre advanced in the same ratio? We are compelled to confess it has not. So far from it, we are obliged to acknowledge, that the wheat crop has declined, within fifty years, from an average of twenty bushels to the acre to ten, while in England it has increased in the same ratio. Nor have we anything to boast of in improved crops of the national grain—Indian corn. In despite of the senseless prizes annually offered by our agricultural societies for the last fifty years for the greatest number of bushels of maize produced to the acre, *without reference to cost*, we doubt whether any prize crop of recent times has excelled that 354 bushels and 69 quarts on three acres—or 118 *bushels and 2 quarts to the acre*, made by Mr. John Stevens at Hoboken, sixty-nine years ago.

To what are we to attribute these unsatisfactory results in the average yield of our fields, notwithstanding the wonderful improvements in our machinery and implements? Several reasons may be assigned for it, among them ignorance of agronomic science, and more particularly of chemistry as applied to agriculture. Next, I should fancy, is too great a tendency to adopt English methods, which are unsuited to our climate. How many homilies have been preached upon the importance of root culture, and more particularly turnips, and how much toil and money have been wasted upon root culture, which, while it constitutes the very basis of successful culture in the moist and temperate air of the British Islands, is the most precarious of crops in our sun-burned arid climate, unless we can have recourse to irrigation, that, with us, the most neglected though the most fruitful of all the agronomic arts; and, finally, the fatal ambition of a vast majority of our people to cultivate great breadths of land without adequate capital.

But let us suppose my assumptions to be all wrong and that our farmers do get from the soil its fullest returns, of what avail would this be if they neglect the politics of agriculture and resign the legislative power into the hands of rival if not hostile industries?

Possibly the instituting of the Granges may be a step in the right direction—a step towards that self-assertion and co-operation, without which fat bullocks and hogs, heavy fleeces and crops, are of but secondary importance, and without which the agricultural must ever remain tributary to all other industries.

There are two other topics which, if I could spare the time from my own paper, I should like to write upon, and which have not received from the agricultural press the consideration which their vast importance deserves—I mean the fence laws and irrigation, the one inflicting upon the agricultural interest a burthen of almost inconceivable magnitude, and the other offering to it a source of fertility and wealth beyond the dreams of avarice.

Field Crops.

CURING ALFALFA HAY.

Alfalfa which is better known in the Eastern States as Lucerne, has since the settlement of California attracted more attention than ever before, although one of the oldest forage plants know in the history of agriculture. Its popularity on the Pacific coast has prompted some of our farmers on the Atlantic slope to experiment with this plant, and the following from the Sacramento (Cal.) Union in regard to the cutting and curing of alfalfa hay may interest them:

There has been, and is yet to some extent, a prejudice against alfalfa hay as a winter feed for stock, especially horses. The principal cause that gave rise to and kept up this prejudice is to be found in the fact that the farmers did not understand when to cut it, or how to cure it, or perhaps, antecedent to either of these causes, we might mention another:—that they did not know how to sow the seed. The seed was sown too thinly on the ground and the plants grew large and coarse and woody. Then this coarse growth was allowed to stand before cutting, till the plants had blossomed, and sometimes till the seeds had formed. In this condition the stems had become more like wood than clover hay, and the leaves had fallen off, leaving what was then called alfalfa hay more like a bundle of sticks than hay.

Then again, it was formerly the custom of farmers to allow this over-ripe grass to lie in the sun and dry till it had neither color nor nutriment in it, and till even the seed that had formed on it had shelled out. Experience with this hay has taught farmers many valuable lessons as to its management. First they have learned that the seed needs to be sown very thickly on the ground, so that stems of the grass will grow small and slender. Secondly, they have learned that the grass, to make good hay should be cut just as it is coming into blossom, before, in fact, it changes its color from green to blue. Thirdly, they have learned that as soon as the grass is well wilted in the sun it should be raked up into winrows and then put into ricks and allowed to complete the curing in this condition.

By cutting the clover while thus green and treating it as thus indicated the fresh, green color is preserved, the hay is kept in a soft and pliable condition, and all the nutriment is preserved, and the hay is relished and eaten by stock of all kinds with the same zest that they eat the fresh growing clover. The hay while in the rick, if put as suggested, goes through a sweating process that changes the juices to starch and sugar, and that fastens all the leaves to the stem, so that in future handling none is lost. Alfalfa hay cut and cured in this way is actually more valuable for cows, horses or sheep than the best wild oat, or wheat or barley hay that can be raised, and is a good feed to winter hogs on. If cut when too ripe, and cured in the sun, alfalfa hay is not worth as much as poor wheat or barley straw; in fact it is hardly worth anything.

Floricultural.

CONFUSION OF BOTANICAL TERMS.

Our remarks as to the improbability of hybrids ever having again been crossed or hybridized, and the impropriety of using the terms "hybrid" and "cross" synonymously, as well as respecting the unnecessary and senseless increase of botanical terms proposed by M. Sachs—having been copied by the London Garden, are supported, we are glad to see, by Mr. P. Grieve; and we hope others will follow until the terms be used so as more accurately—we think we might say, truthfully—to express the union which by artificial fertilization is *known* to have taken place; until, indeed, the indiscriminate use of the word hybrid be discarded from the catalogues of seedsmen and horticulturists.

Mr. Grieve says: It is stated (see p. 37, Garden, Rural, p. 393.) that when a hybrid is made to unite with one of its parent forms, or with another parent form, or with a hybrid of different origin, the product is termed a "derivation hybrid." I am induced to ask if anyone of your readers can kindly point out to me an instance of this circumstance having taken place. As far as my experience goes, I have always found it to be impossible to induce a hybrid to form a union with any other plant, sterility appearing to be the unvarying accompaniment of hybridity. The terms "hybrid" and "cross" would appear to be frequently considered as synonymous, and applied indiscriminately. This should certainly not be done. Hybrid should never be applied to productions originating between different varieties of the same species, which are generally, if not always, fertile, while those originating between different species of the same genus, as well as those of more rare occurrence between different genera, are, I believe, invariably sterile. Should instances, however, be known where such is not the case, particulars regarding them would doubtless be interesting to many.

EXCHANGE.

To Marion.—I have been reading the description of some of your flowers, in the Rural New-Yorker, and feel very much interested in them, especially the one with cups around the stem. Would like to exchange with you this fall and get some of the seeds of it. I have the Euphorbia, or Snow on the Mountain, besides a good many other handsome annuals. Will name some of them: Asters, Balsams, Cockscombs, Coreopsis, Clarkias, Cacalias, Larkspurs, Nasturtiums, Sweet Peas, Portulacas, Marvel of Peru, Whitlavias, Verbenas and Zinnias, besides some Everlastings. If you would like to exchange for any of these, address Mary Waley, *Poquonoc Bridge, New London Co., Conn.*

[Mrs. Waley refers to "Molucca Balm" or Shell flower.]

MISCELLANEA.

Ligustrum tricolor, the three-colored Privet, either as a house plant or for the garden is a pretty shrub. It is not strictly three-colored. The new leaves are green and purple. As the leaves get age, the purple changes to yellow or buff, the variegation then resembling that of the variegated *Vinca* or Periwinkle. It is budded upon the common Privet, *L. vulgare*—was imported from Scotland three years ago, though it is now in the hands of several American nurserymen and will soon be offered for sale.

Seedling Deutzias.—Our readers will remember the seedling Deutzias to which we called attention last fall as being easy of cultivation. We raised about fifty from seeds of the double flowering Deutzia. About a dozen have borne double flowers, one pure white, the others variously marked with red upon the outer petals of different shades. But there is not one that differs notably from those already well known. We, nevertheless, advise our friends to procure seeds this summer (they are ripening now), as, aside from any hopes of obtaining varieties, we know of no easier or quicker way of obtaining shapely, flowering plants.

We have never been so well pleased with the double-flowering Hollyhock as this season. Suggestive of the old Hollyhock that is too common to be worth much care, we find that the most improved strains of the double varieties are little known in gardens even of considerable pretensions. Among these latest strains, the lemon-colored seems the most lasting, the most double and florif'erous. The flowers resemble rosettes made of yellow tissue-paper—not a very lovely resemblance, perhaps, but one fully appreciated during our late drouth, when many both homelier and prettier flowers fizzled entirely.

Lilium Humboldti bears the brightest orange flower we have ever seen, and among the orange-colored lilies we give this the preference. The petals are recurved the same as in *L. superbum*, but larger, of a more uniform color and speckled less decidedly. The habit is tall, slender but strong, and the pyramidal racemes of flowers need no support. After several years of trial, this is our first success.

L. Washingtonianum also bloomed with us for the first. The flower is white, with narrow petals. Long life and an exceeding popularity to it. One at a time is enough for us.

THE SATELLITE SPHINX MOTH.

NOTES.

We see that at Kew (England) the shrub Fremontia Californica stood out last winter in safety, and the Gardeners' Chronicle says that "it is unfortunate that its increase is attended with so much difficulty, being one of the finest of flowering shrubs." We purchased a quantity of seeds of this plant last fall—sowed a part, and gave the rest to several friends. Ours did not germinate. We have not heard from our friends as to their success.

Entomological.

THE NEW YORK WEEVIL.

In the accompanying illustration we give a life-size portrait of what is generally known as the "New York Weevil." The term "weevil" being by common consent, or long habit, applied as one of the common names to all the numerous members of the great Curculio family (*Curculionidæ*), whether an inch or more in length, like the palm weevil (*Rhyncophorus cruentatus*, Fab.), found so abundantly in the South, or the minute rice weevil (*Calandra Oryzæ*, Linn.), all appear to get weevil attached as a terminal name, hence we hear of plum weevils, grain weevils, hickory weevils and so on without end. But when we come to speaking of insects in a manner to be understood by the scientific world generally, some more definite appellation is required in referring to any particular species, as common names of things seldom range over a very extended region of country, hence are extremely indefinite and uncertain in their application.

N. Y. WEEVIL.

This New York Weevil was described by Forster, the naturalist, who received specimens from this country, he bestowing the scientific name of *Ithycerus noveboracensis*, the latter or specific name meaning "of New York," he doubtless receiving specimens from this State. Although now generally known in this country as the New York Weevil, it is probably less numerous in this State than further west, where it sometimes does considerable injury to peach and other fruit trees by eating off the bark from the tender twigs. It is supposed to breed in the young branches of the Bur Oak and the Pignut Hickory, at least Prof. Riley says he has found the female depositing her eggs in the twigs of these trees.

This beetle is of the size and form shown, and of an ash-gray color, with small black spots, and we think will be readily recognized from our illustration. It is a regular "hard shell," difficult to kill by any application to the plants which it infests, consequently the best way to rid an orchard of this pest is to go over the trees, whenever it is known to be about, and gather them by hand.

LARGE GRAPE-VINE CATERPILLAR.

Eds. Rural: I send you by the same mail as this, and in a tin box with some vine leaves, a large worm, which I found feeding upon my grape-vines. It seems to be a voracious feeder, as this specimen had already eaten up at least a dozen leaves. X. P.

Sussex Co., N. J.

The caterpillar arrived in good condition—thanks to careful packing. We recognize it as the larvæ of the Satellite Sphinx (*Philampelus satellitia*, Linn.), an insect which infests plants belonging to the grape or vitis family. These caterpillars, or worms as they are generally termed, grow to a length of three or four inches, and nearly as large as a man's finger. They vary somewhat in tint, but are usually of a cream color, with a shade of reddish brown or pink. When these worms reach full maturity in autumn, they leave the vine and crawl into the earth and there cast off their caterpillar skins, entering what is termed the chrysalis stage, in which it remains until the following spring, when the last transformation takes place, coming forth a large and beautiful moth, as shown in the accompanying illustration.

The colors of this moth are a light olive gray, variegated with dark olive green. Soon after the moths appear in spring, the females commence depositing their eggs singly upon the leaves of the plants upon which the caterpillars feed. These caterpillars assume different colors at each molt. At first they are of a green color, with pink sides, and at the caudal extremity there is a long, pink horn, which grows shorter at each successive molt, until at last it disappears entirely. This insect, although a voracious feeder, is readily kept in check by gathering the caterpillar, as they are so large few need escape notice in looking over the vines in summer, at the time of cultivating or pruning.

The Poultry Yard.

KEEPING POULTRY.

In my last, I treated of small places, where few fowls could be kept, and that if desired, such as needed no netting over their yards to keep them in. I now propose to treat of fowls that can be kept in confinement under ordinary circumstances, in a tolerably sized yard, at more profit than the Asiatics, which lay larger eggs and more of them in proportion to the food consumed, for instance such breeds as the Leghorns, Spanish, Houdans and Dominiques. The Bantams also thrive in such a place. The white Leghorns stand high on the list of profitable and prolific layers, their eggs being of large size and fine quality. This breed thrives well with ordinary care, withstands a tolerable degree of cold, lays well in winter, does not usually sit, is contented in confinement and is altogether a hardy American bred bird.

Size and vigor of bird should be preferred for use in preference to monstrous combs and very white ear lobes, and this holds good with the brown Leghorns, which are also neat and handsome fowls, but whether as hardy and vigorous as their white brothers and sisters, remains to be proved. This is a very popular breed just now, but the different strains vary a great deal.

Spanish fowls (now a neglected breed) if kept in a good warm place, succeed tolerably well in confinement. Where the winters are not very severe, they are one of the best for laying large eggs. The birds are very beautiful except at moulting time when they cut a very shabby figure. For weight and quantity of eggs against weight and quantity of food, it would be hard to beat them; they are of gentle habit and are also non-sitters.

Houdans are a deservedly popular fowl, being good layers, not quite up to the above breed in that quality, but surpassing them all in one very essential quality, that is for the table, being a fine flavored fowl, fleshy and juicy. To hold its own this breed requires more room and a little more attention than the first named varieties, not being quite as hardy, but it is a fine, square heavy fowl.

Dominiques, although longer residents of this continent and generally accepted as an American breed, do not make as good a record as the Leghorns, but it is a breed that can be much improved by proper care, as the shows of late have demonstrated. Henry Hales.

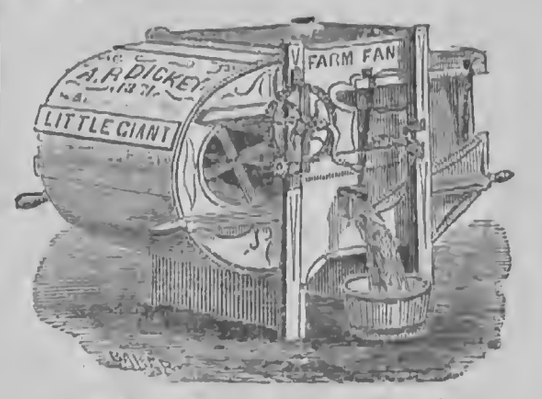
Chicken Cholera is more prevalent this season than ever known before.

Industrial Implements.

DICKEY'S FARM FANNING MILLS.

We illustrate this week a farm fan which we saw at the Centennial, and which seems to possess merits that place it among the front ranks of this class of implements. The substantial way in which it is put together; the honest and thorough workmanship which adapts means to ends with a perfect economy and directness of purpose, make it an admirable thing to have in the barn. Judiciously used it is capable of saving its original cost each year.

Mr. A. P. Dickey, Racine, Wis., is, we might say, one of the pioneers in the manufacture of fanning mills, and the acquired experience of thirty years' incessant toil in this branch of industry has been rewarded; its product, the "Little Giant," combines all improvements to date. They are made of nine sizes, suitable for the wants of every person, and having a capacity for cleaning from 40 to 400 bushels per hour. They are furnished with all necessary extras for cleaning small seeds and every kind of grain. They are easily operated; separate foul and refuse matter from oats, wheat, barley and other grains with great ease; are economical and durable.



The arrangement for cleaning flax, clover or timothy is very perfect, the sieves being produced with blinds and screw boards to shut off the wind and regulate the wind at pleasure. A special feature of this fan is the Macphail Hurdle and Spout, which is furnished with the mill at an additional charge. This effects a further separation of matter rejected from grain being cleaned, and spouting out at the side and end of the Hurdle any oats or other grain remaining, thus saving the labor of cleaning the tailings.

This improvement is an especial feature of this mill, no other, we believe, being thus equipped. We deem it unnecessary to dwell on the advantage of fanning mills, believing farmers are aware of the economy attending their use. They raise the grade of wheat from a lower to a higher standard, and prepare grain for seeding in a most thorough manner. Mr. Dickey will send circulars and information free concerning his manufactures.

THE ECONOMIZER.

This compact little boiler and engine, with which our readers have become familiar through our advertising columns and elsewhere, is deserving of a more extended notice than a mere announcement. It differs in many particulars from the light motors designed for the use of small manufacturing industries. The "New Idea," as Messrs. Whitman & Burrell, Little Falls, N. Y., designate their invention, is, at will, a portable or stationary engine. It comprises a horizontal boiler, made of the best material, and ready for work as soon as it reaches its destination, needing no preparatory mason work for foundations, etc. Its heating surface is admirably adapted for producing power at the minimum of cost, and the arrangement of fire box, flues, etc., is such that the operator can regulate the generation of steam so as to use just enough to do the work in hand, whether the engine is called upon to exert its full capacity or only a fractional part of its power; the expense of fuel being governed accordingly. The fire being entirely surrounded by water, no fire tile is necessary, and the arrangement of the flues makes "scale" an impossibility.

The various attachments, such as the "waterback," patent adjustable cut-off, Judson governor, improved heater, and above all, its compactness, make the "Economizer" one of the best engines for farmers, dairymen, and factorymen. It would be impossible to give a more detailed account of the apparatus in the circumscribed limits of this notice, but what has been said should stimulate curiosity sufficiently to encourage our readers to send for circulars, which explain the "new idea," fully accompanied with pertinent illustrations.

Time is never wasted when spent in investigating the claims of improved machinery, especially when it has a direct bearing on one's own occupation. No progressive agriculturist will hesitate to admit that the time is upon us when a steam engine is one of the requisites of modern farming.

The Centennial.

CENTENNIAL CORRESPONDENCE.

CENTENNIAL FIELD EXHIBITION, }
SCHENCK'S STATION, Pa., July 21, 1876. }

Early this morning the genial face of Brother Coleman appeared upon the field. He was accompanied by Mr. John B. Waring, of the Delamater Iron Works at New York, inventor of Waring's Air Compressor, and one of the best of America's mechanical engineers. Mr. Waring had conducted the trials with the Dynamometers on the previous days, and was one of the first to advise the rejection of the tests as not perfectly trustworthy. This was Waring's day. As he had kindly consented to come here, upon the solicitation of Mr. Landreth, the latter, in conjunction with Mr. Geddes, resolved to get the full worth of his money out of him. But Waring had seen service before and was not to be caught napping, so, dropping his coat and such other surplus clothing as came within the rules of stag society, he pitched in. It was what might be called steamer day. The Portable Engines were one by one attached to the Locomotive and placed in position to be attached to the Blower for testing.

The engines on the ground that were put to the test were the "Best," made by John Best; the "Eclipse," Frick & Co.; the "Phœnix," Chandler & Taylor; and the "Farquhar," A. B. Farquhar. The Eclipse was notable for its fine, mechanical finish, and all expressed their admiration at the excellence of the work performed by it. The Best may be all its name implies, but as it was its first appearance, little can be said as to what it will do in the future. The Phœnix worked very nicely and gave every evidence of being a first-class machine, well adapted to the work for which it is designed. How are the figures arrived at? By an ingenious contrivance called a Blower—a term which, applied to this useful piece of mechanism, is in one sense a misnomer, as it performs its task without any blatant fuss—wind is generated by a series of fans, set in motion by gearing, which force an air current through a small aperture into a rubber tube that is attached to a registering face which records the power by inches. The belt of the engine driving-wheel is slipped on to the wheel of the Blower, and the power is accurately registered on the index above mentioned.

After attaching the engine to the Blower by a long belt, the water being at 150° temperature, 10 lbs. of soft wood, 10 lbs. of hard wood and 100 lbs. of soft coal was weighed out and administered in one dose to the engineer, who then started the fire. The time between that and a pressure of 50 lbs. of steam was recorded, and the amount of water used during the test was also measured and recorded. At 50 lbs. pressure the fun began. Brother Waring then took out of his vest pocket a little silver-plated instrument (a revolution counter) and his watch. The former he inserted in the end of the shaft and the latter he held in his hand, right under his immediate eye. Whether he held his breath or not, I don't know; but I did, which was quite as good. He then consulted the thermometer arrangement attached to the Blower. I let my breath go again, and he wrote something on a piece of paper. This ceremony he repeated every few minutes while the engineer was at work.

During the continuance of the regular trials there was a sort of brevet trial going on under the auspices of Mr. Bruce, who tested to his apparent satisfaction the Silver & Danings Power Straw Cutter, which cut 500 pounds of straw in 11 minutes. The power applied was their two-horse tread, which was hardly sufficient, as with more power better time could have been made. Messrs. Ross & Co. unfortunately broke some of the gearing of their Straw Cutter in bringing it out, so that it could not be tried. The Common Sense Straw Cutter had no representative present, and, therefore, Mr. Bruce passed it by.

Mr. Kibler had the only Fan Mill on the grounds.

Last night there arrived a Russian Threshing Machine and Portable Engine. Both were about twice or thrice the size and weight of our largest ones. Bro. Geddes was in a quandary as how to unload them from the car and get them to the field. Again Mr. Castler, with his locomotive, came to the rescue.

While the steam engine trial lulled, Mr. Coleman tested the powers and efficacy of the Russian Thresher, or Beater, which was of six-horse power, manufactured by Lilpop, Raw & Loewenstein, at Varsovie, Russia. It had a 60-inch cylinder, 2 feet in diameter, with 12 beaters. The concave was very peculiar and gave a large rubbing surface. The construction was entirely different from that of any of our home machines; it was set on low wheels, about 7 feet apart, adapted to the Russian roads. Our British Juror doffed his surplus clothing, mounted the feeding table and fed to his heart's content. You know the English people are fond of feeding, and he was only gratifying his national proclivity at the expense of unnecessary dignity. The machine did good work, however, and brought the grain out in excellent condition.

The steamers were all tested, except the Russian, and, as night was falling, it became a question whether anything further should be done. The trial was over except this one engine, and at it they went despite the darkness and lateness, both of which, however, finally compelled them to give it up and adjourn till to-morrow for this one engine.

July 22.

The Russian Portable Steamer, which arrived on the grounds late yesterday afternoon, was tested this morning. This engine was much heavier than anything seen in this country, being built with low wheels, wide apart, similar to the thresher tried yesterday. It has an upright tubular boiler with a wooden jacket, inclined compound crank engine, and combined pump and heater. The pump is worked by an eccentric from the main shaft. Its weight is about 8,000 pounds. The machine is made by the same parties that exhibited the Russian Thresher, or Beater. It broke down twice before the final test could be made, which mishaps were accounted for by their not having a competent engineer. The boiler showed great capacity for producing steam, and on time beat the American machines shown the day before.

As a whole the trial was an exceedingly satisfactory one to all concerned, and the various officials were so well pleased with their work that they even bid a pleasant good-by to the newspaper reporters, among whom was

SHORTHORN.

ATLAS HOTEL, }
PHILADELPHIA, July 29, 1876. }

As I gaze drearily at the postal-card before me, it seems as if I had labored in vain, for lo! a lady correspondent writes, it appears, to the New York office to the effect that she does not so much wish to know what is noteworthy in the Exhibition as how to get there, what to do, where to lodge, and so on *ad infinitum*. The lady, too, is a constant reader, regular subscriber, or something of that kind that leaves an impression of continuity on the mind, and it is strange indeed that she should have failed to read the letters in RURAL of May 13, 20 and 27. These letters were prepared with great care and contain information that covers the whole ground, giving time-tables, fares, price of lodging, etc., etc. As Mr. Mantilini would say, one has there the "domnition total" of the expense of the trip, not including extras. It may be as well to again summarize the main points.

To begin: When you have decided to come to Philadelphia, procure from the nearest railroad agent all the details of which he is possessed concerning routes. If he don't seem to know much about it, compel him to ascertain: it's his business. Buy "excursion tickets" if they will permit you to remain as long in Philadelphia as you wish. They are much the cheapest. All trains land you within 50 feet of the main entrances to the grounds, and among a shoal of hotels that in price and accommodation are as various as the colors in the historic Joseph's coat. I assume at once that you do not desire to pay $4 and $5 per day, and will not mention the "Trans-Continental" or "Globe" as eligible. The "Boarding-House Agency" will billet you all over Philadelphia in private houses. Their way of doing business is fully explained in the letters referred to above. It is not a good plan to get too far away from the grounds, because of the time wasted in going to and from them. If I were to advise a friend whose income had a modest habit of shrinking, I should say go to the "Atlas." Why? Because it is about two hundred feet from one entrance to the grounds; lose no time. Lodging is $1 per day, which entitles you to one bed in a small room containing two beds, from 9 A. M. until the following morning at the same hour. As long as you remain you will have to renew your right of possession daily by investing in a coupon and paying a dollar. Single gentlemen use rooms containing four beds each, while on the other hand ladies who happen to travel unaccompanied by male escort, have quite a number of rooms set apart for their exclusive use in a wing of the buildings remote from the masses. Such rooms contain one bed only, when desired. This is a good arrangement and, judging by the number of ladies who are viewing the wonders of the world *solus*, a popular one. The clerks of the Atlas, Messrs. Matt. R. Clark and Newcomber, are courteous and painstaking gentlemen who are successful in their endeavors to make all comfortable, being especially considerate of the wants of those who have no "men-folks" to transact the business part of pleasuring. Of one thing all may be assured: Loneliness is out of the question, with 5,000 guests to whom you can express your opinions. Music enlivens the tedium of the evening. In fact, strains from a piano are wafted along the immense restaurant with your soup, for instance, and, like the poor, remains with you until the last spoonful of a water ice disappears. Speaking of the restaurant, I should say that your food will be a separate item of expense. The restaurant connected with the Atlas is well managed by Mr. Rielly, and the prices charged are reasonable, as the food is good. Any further information is within the reach of all by addressing "Atlas Hotel, Philadelphia, Pa."

My lady correspondent further asks, "What is the correct thing to wear?" I shall refer this question to the Fashion correspondent, "Frolic," who has been here and can tell all about it. I should say that the chief article of female attire was a note-book. Every lady here seems to have relegated her memory to paper, and it is quite apparent there's a "chiel amang us takin' notes," I sincerely trust *not* to "prent" them.

Ladies have great method in their madness, and it is most amusing to observe them at the hotel after the day's sight-seeing is accomplished. One will tell another about the wonders of Agricultural Hall, and suddenly remembering an item, dive for the note-book and write (perhaps):

"There's carts and gigs,
And pins for pigs,
There's dibblers and there's harrows,
And plows like toys,
For little boys,
And illegant wheelbarrows."

Speaking of Agricultural Hall, it's not a little odd to observe what an interest the ladies take in all that relates to the farm, and even in Machinery Hall—where

"There's staym ingynes
That stand in lines,
Enormous and amazing,
That squeal and snort,
Like whales in sport,
Or elephants agrazing,"

—they seem to enter into the spirit of the thing and take notes as industriously as if a record of the display was the one thing needful to cause them to remember it forever and ever. Perhaps it is, and——

YOUNG RURAL.

Sheep Husbandry.

ROQUEFORT SHEEP AND CHEESE.

Those of our readers who have eaten cheese made from the milk of goats or sheep will scarcely fail to be interested in the following on the subject, condensed from the Geographical Magazine:

The animal is remarkable in appearance, with a flat and narrow breast, very poor shoulders and legs, immense sides, and a vast development of milk. The lambs are weaned so early, for commercial reasons, that they never grow into a fine form, and when sold at a certain age are worth no more than a few francs. Nevertheless for the production of Roquefort cheese their milk is matchless. An experiment was made some years ago with the merino breed, but it failed altogether. Few have any idea of the subtleties involved in, or of the pains bestowed upon, this manufacture. To them all else gives way; it is a landscape of sheep—400,000 of them, from the most bleating infancy upward. The ground is gray with them, and when at their prime they are worth a guinea apiece. Nowhere is the "silly sheep" so tenderly watched over; he is fed with plenty; in winter he eats dried grapes carefully preserved, and drinks water whitened with barley flour; he is taken out for an airing when the weather is fine, and coddled like a Turk when it is cold. But the summer is the grand season, though he is still under some restraints. For instance, he must finish with one plot of herbage before beginning upon another, and it is amusing to look on while he, with perhaps a hundred other greedy rebels, tries to evade the crook. The flock is never led far at a time, for fear of tiring and distressing it; no barking dog or brutal boy is permitted to frighten it; its thirst is quenched at pure pools with "the chill taken off" by the sun: but the assertion often made that aromatic and balsamic plants enter largely into the pasturage is erroneous. It is not to a quantity, but to a fine quality of milk that the cheese farmer looks, and, as might be expected the traditions of this industry are its laws. One is not to let the sheep associate with oxen or goats. They are the aristocracy of Larzac, and keep other creatures at a distance. It is milking time morning, though it will be milking time again in the evening. Hundreds—thousands if you could see them—swarm in the sweet meadows, each carrying a very short-legged baby-looking stool, each catching a victim. But the pretty dairy-pail of Holland, of snow-white wood, with glistening copper hoops, is represented here by an ugly iron pot, lined with tin. Once full, it is hurried off to the farmhouse, skimmed strained, warmed to a degree according to the state of the weather, though never above boiling point, thrown into enormous deep vase-shaped pans and left to accumulate its cream. With a keenness of judgment only to be acquired by a life-long and even perhaps an hereditary experience, the dairyman distinguishes between the quality good for butter and the quality good for cheese. Then the morning and the evening milk are blended, and a number of young damsels, laughing like the girls of Chusium, stir these innocent caldrons with willow sticks. After that the covers are put on, and "mother of cheese" is left to take a little rest not, however, before the due proportion of rennet has been added. I do not feel bound to follow the entire series of operations, the breaking, the squeezing and filtering of the curd, the molding, milling and draining, but was interested in what followed—the rubbing of the new cheeses with moldy bread, which indeed, enters into the composition of the cheese and helps to give it the green ripeness that is essential. They are next arranged on grooved shelves, allowing whatever milk remains to run off; they are turned twice a day for about a week; then they go to the drying room, a twilight excavation among the caves of Chambalou, always facing the north, exquisitely clean, with metal or canvas blinds to keep out the dust and flies, and fitted with linen-covered shelves, where the cheeses remain, kept warm by pails of boiling water in incessant relays, until pronounced ready for the cellar. But they are far from being done with yet. I may as well say a word, however, concerning the moldy bread. The highest importance is attached to it. It is made "on the premises," from the finest wheat or winter or March barley, with a large quantity of the strongest yeast, kneaded beyond a necessity, except in the cheese-maker's eye, baked thoroughly, deprived of its crust, pounded in a mortar, allowed to be in a damp place until every crumb is touched, sifted and so prepared, it actually grows through the cheese like a plant. Indeed, the botanists have given it a name. On the passage from the drying vaults to the cellars the same delicate care follows the Parisian's *bon bouche*; it is packed with as much solicitude as though it were Venetian glass, in cases of special construction, and loaded in vans slung below the axles instead of above them, so that the crust may not be broken by the joltings of the wheels. And the transit must be made by night, so that the heat of the sun may not afflict these tender tid-bits. Arrived in the "scale chamber," they are examined, like the wounded after a battle; the spoiled put aside, the rest weighed, all registered. The rejected go to the farm proprietors, whose families do not mind eating them. But for the others maturity has not even been attained. They must be salted, that is a handful of salt is spread over one surface, and twenty-four hours later over the other. Then, two days elapse, and the salt not already absorbed is rubbed in with the roughest of Dutch drapery. Another two days, and still these persecuted cheeses are upon the rack, this time under the edge of a knife. First of all, a white outer coating of glutinous matter is removed, its thickness varying with the season. There is a second scraping immediately afterward, also white, which is eaten by the poorer classes. That ceremony being accomplished, the judges are called in to classify the products of the Roquefort farms. There is one of a Roman order which is above suspicion, and, therefore not classified at all. Next come the first and the second qualities, which, like Eastern slaves, after being inspected, have to undergo a sort of shampooing, and to be dressed. They dress themselves however. They put on a yellow, or a white, or a reddish covering of must, which is sold for a few farthings a bushel, as food for pigs, but this outburst—so capricious is the temporary Roquefort cheese—is renewed at intervals of from eight to fifteen days, and a joyous industry it seems to be.

A month or somewhat more passes over, and Roquefort is ready for the market. The ripest is selected, of that season. Last season's prime is kept, like old port, to get another crust, which should be red in color, and, when scraped off, a luxury of the farmer's table. September, is the month. The cheeses are then slightly shriveled, pungent in taste, just what the epicurean artisan of the faubourgs likes to keep a bit of, like a tobacco quid in his mouth, while he swallows his litre of wine. The distribution begins. Another packing takes place in round wicker baskets, willow hampers and boxes. Vain to attempt defrauding the Parisian palate—as well try to palm off oak apples for olives. Sheep's milk is not the same everywhere, and tradesmen of a high class, in France, never dream of deceiving their customers upon the point. They announce in their windows, *fromages, façon de Roquefort*, as who should say gilt, not gold. The true cheese, the unimpeachable and immaculate Roquefort, meanwhile, is being scattered from the humble little Aveyronnaise town to the four winds of heaven and earth.

THE only effectual cure for a sheep-killing dog is a large dose of leaden bullet from the barrel of a rifle with plenty of powder to give it force.

Domestic Economy.

BIDDYISM.

THE discussion of the servant-girl question has monopolized, to an alarming extent, society's small talk. Nay more, it has invaded the home circle, is served at breakfast, dinner and tea, and forms not an inconsiderable element in the entertainment of visitors. It was our painful duty to call on Mrs. A. the other evening. Well knowing her weakness, we went fully determined to steer clear of the all-absorbing topic, but, it must be confessed, not without misgivings as to the result. If our memory is not at fault, the conversation opened in the usual way, with a few desultory remarks in reference to the weather.

From this seasonable subject we rambled on, aimlessly to all appearances, until it was about time to take our departure. It did look as if our fondest hopes were to be realized, when in an unguarded moment we inquired after Mr. A.'s health. The old lady laid aside her spectacles, and with an energy far surpassing any previous efforts, replied: "Poor Mr. A. has retired much earlier than usual this evening, completely tuckered out. Do you know he has spent the better portion of the day hunting after a Biddy? Our beauty left us this morning without a moment's notice, and here I have been the whole livelong day fretting and stewing among pots and kettles, until I'm completely exhausted. To think that after doing so much for them that they should serve us so, the ungrateful wretches! But I couldn't stand the impudent huzzy's slack any longer. Now, there is Mrs. F., she never has any trouble with her help. I don't understand for my part how she manages so well."

All my diplomacy vanished as dew before the morning sun. The dear, old soul had found her level at last and didn't we catch it—whew! She rattled on, regardless of time and consequences; told us all about the vast army of BRIDGETS and MARY ANNS, which at one time or another, had infested her household; expatiated on the phenomenal good luck of Mrs. So-and-so in keeping girls; explained why Mrs. B. had to change her help every week—in fact told all she knew. What she didn't know she surmised, and what she didn't surmise wasn't worth hearing!

We merely cite this instance as an infinitesimal fraction of every day experience. To say the least, the whole subject is loathsome and disgusting, fit only for circulating among the class from which it emanates. BRIDGET is one of the evils necessary and incidental to housekeeping, but how much common sense does it require in order to appreciate the fact that the male portion of the community do not care as a rule to be bored almost to distraction by such an abomination?

We venture to say that such a thing was never known as two women getting together without discussing "my" servants, or if they didn't happen to have any, somebody else's, which amounts to about the same thing, and sometimes a good deal more. Who is particularly anxious, after coming home from a hard day's work, to listen to the croakings of a lot of old gossips about Mrs. W.'s help? Surely, the man who can relish such a dish must have a remarkable constitution. From the petted wearer of silks and satins to the humble occupant of a calico wrapper, it is pretty much the same. All seem imbued, to a greater or less extent, with a craving after this detestable and nauseating subject. Some there are who have nothing else to occupy their minds, and consequently must have something to talk about. Others wish to impress upon your mind how many servants *we* keep, while not a few it must be regretted, use the subject as a common sewerage for the dissemination of gossip and scandal. One-half the time consumed in comparing notes with Mrs. B., if spent in some profitable, refining occupation, would make the whole household more cheerful and the community at large happier by far.

Anything under the sun but this intolerable Biddy question. Try science, art, literature—anything in fact, but if you can't find something suited to your caliber, put on a knowing look and keep silent. You will then be credited with something you never dreamed of possessing. After all this advice, if you will persist in so demeaning yourself as to degenerate into discussing every servant girl in the place, don't be offended if, in anguish of spirit we cry out lustily, Peace, ho! F. J. W.

WE sympathize with our correspondent, and know from painful experience whereof he speaks. But we are also quite well aware of the fact that women who possess the ability to properly direct in household matters, seldom have any difficulty in obtaining and keeping good servants. Or, to put it in other words, the Lady of the house makes good servants out of the crude materials, imported or otherwise.—ED. RURAL.

FRIED SQUASH.—Slice thin, dip in egg, then in flour and fry in butter.

A NOVEL SMOKE HOUSE.

ONE sees very strange sights sometimes, and I am disposed to tell your readers how some people smoke their hams in winter, here in Minnesota. The snow falls to a great depth occasionally and drifts deeper yet, in places. Said a farmer to me last winter, "the very nicest hams we have had, were smoked in that snowdrift over yonder." And sure enough, there were props put up at each side of the large hole, for support to the poles to hang the meat on—a board door and the smoke house was ready for use. Simply a very large hole dug in one side of a snowdrift.

MRS. JULIA M. WHEELOCK.

ORIGINAL RECIPES.

Spiced Currants.—Three pounds of sugar to seven pounds of currants, one teaspoon each of ground cinnamon, allspice and cloves, a pinch of red pepper if liked. Boil a half hour. Very nice to eat with meat.

Pickled Apples.—Three pounds of sugar, seven pounds of apples quartered and cored, one pint of vinegar. Steam the apples till a fork will go through them readily. Then make a sirup of the sugar and vinegar and pour over them while hot. Stick a clove or two into each quarter. Very nice.—FARMER'S WIFE.

Fried Cauliflower.—Boil and mash, season with pepper and salt. To one medium-sized head, add a half pint of milk, two well beaten eggs, and flour enough to make a batter. Put a spoonful at a time in a pan of hot lard, or better, butter, and fry a light brown on both sides. A good breakfast dish.—MRS. RUSTIC.

Centennial Pudding.—One pint buttermilk, three tablespoonfuls of cream, one teaspoonful of soda, one teaspoonful of salt. Indian meal and wheat flour, equal parts, enough to make a not very thick batter; bake in the usual way. After baking split it open, spread with butter, and apply fresh raspberries. To be eaten with sweetened cream.

Graham Gems.—One cup cream, one cup sour milk, one teaspoonful soda, one tablespoonful molasses, salt, one cup wheat flour, two cups graham flour. Bake in gem tins.—JENNIE.

Baked Potatoes.—To eight or ten sliced potatoes, put two quarts of rich milk in a deep pan, butter, the size of an egg, a little salt—bake two hours—serve hot.—MRS. J. M. W.

Hygienic Information.

EARLY BREAKFAST.

IT may be some consolation to those who are obliged to take early breakfast that so good an authority as DR. HALL descants in this wise upon the subject:

Breakfast should be eaten in the morning, before leaving the house for exercise, or labor of any description; those who do it will be able to perform more work and with greater alacrity than those who work an hour or two before breakfast. Besides this, the average duration of the life of those who take breakfast before exercise or work, will be a number of years greater than those who do otherwise. Most persons begin to feel weak after having been engaged five or six hours in their ordinary avocations; a good meal reinvigorates, but from the last meal of the day until next morning, there is an interval of some twelve hours; hence, the body, in a sense, is weak, and in proportion cannot resist deleterious agencies, whether of the fierce cold of midwinter, or of the poisonous miasm which rests upon the surface of the earth, wherever the sun shines on a blade of vegetation or a heap of offal.

This miasm is more solid, more concentrated, and hence more malignant, about sunrise and sunset, than at any other hour of the twenty-four, because the cold of the night condenses it, and it is on the first few inches above the soil in its most solid form; but as the sun rises, it warms and expands, and ascends to a point high enough to be breathed, and, being taken into the lungs with the air, and swallowed with the saliva into the stomach, all weak and empty as it is, it is greedily drank in, thrown immediately into the circulation of the blood and carried directly to every part of the body, depositing its poisonous influences at the very fountain head of life.

The older merchants of Charleston may remember that when deadly fevers prevailed in hot weather, they dared not ride into town in the cool of the morning or evening, but mid-day was accounted safest.

If early breakfast was taken in regions where chills and fever and fever and ague prevail, and if, in addition, a brisk fire were kindled in the family-room for the hour, including sunset and sunrise, these troublesome maladies would diminish in any one year, not tenfold, but a thousandfold, because the heat of the fire would rarify the miasmatic air instantly and send it above the breathing point. But it is "troublesome" to be building fires night and morning all summer. It being no "trouble," requiring no effort, to shiver and shake by the hour, daily, for weeks and months together.

HYGIENIC NOTES.

Ague.—If you are made miserable with chills and fever, dissolve 15 grains of citric acid in a cup of hot coffee, and drink it just before the chill attacks you. It has been known to cure the worst cases of this disease.

Remedy for Nose Bleed.—Take equal parts of burnt alum, white sugar, and white of an egg. Mix well, make a swab by rolling cloth hard the size of the nostrils, saturate the mixture, and insert in the nostril. The bleeding will immediately cease.

Cure for Burns.—Charcoal has been discovered to be a sure cure for burns. By laying a small piece of cold charcoal upon the burn the pain subsides immediately. By leaving the charcoal on one hour, the wound is healed, as has been demonstrated on several occasions.

Sun Cholera Mixture.—Take equal parts of opium, red pepper, rhubarb, peppermint and camphor and mix them for use. The dose is ten to twenty drops in three or four teaspoonfuls of water. "No one," says the Journal of Commerce, "who has this by him, and takes it in time, will ever have the cholera."

Laugh at a cheese diet as you will, Prof. Peck says that in this country, where cheese is used least, it requires one physician to every five hundred persons, and in Switzerland and foreign countries, where it is used most, it only requires the practice of one physician for ten thousand persons.

Erysipelas.—I have found sour milk, buttermilk, or whey therefrom, an excellent remedy to apply for the erysipelas as a wash. Also to apply glycerine twice or three times per day; it has a soothing effect. I have many times applied the milk hot and found it allayed the inflammation better than cold applications, and far less troublesome than poultices. MRS. J. M. N.

Felons and Rusty Nails.—Elder Evans, the Shaker, says: For the past ten years we have treated felons with hot water, and with unerring success. No cutting, no blistering, no anything, but immersing the finger, hand, or even the whole arm if necessary, in water as hot as can be borne, until the pain is gone and the core is loosened and drawn from the bone. When rusty nails have produced wounds, the same course has been pursued. If on the hand or foot, keep it in hot water.

Rheumatism in the Joints.—When the joints are stiffened with rheumatism or a settled cold, the following applications are capital and enable the sufferer to move with ease:—Cut into small bits (or grate it) one ounce of castile soap. Add a heaping tablespoonful of red Cayenne pepper. Have these in a small pitcher and then pour on to them half a pint of boiling hot water. Stir until all is dissolved and add a little cider brandy or alcohol when bottling. An application of the above brings the blood in a glow to the joints. Rub a little sweet oil on to relax the muscles.

The Apiarian.

THE BEE KEEPING INDUSTRY.

THE following exhibit of the bee keeping industry from the Industrial Motor, appears to us to be rather strongly put in round numbers, still it may be true. There is however one very important point left out and that is the annual losses by those who are unsuccessful, which according to some estimates amounts to about as much as the entire profits. It is doubtless true however that the honey interest of this country is one of such growing importance as to be attracting the attention of a great many capitalists. Honey promises fair to become a source of national wealth. It is estimated that 70,000 of our people are engaged in apiarian pursuits, some of them having sold last year from fifty to one hundred thousand pounds each, the product of their own bees. It is said that the income of I. S. Harbison, the great California honey magnate, derived from the sale of surplus honey, is more than $25,000 per annum, over and above all expenses. In this State, Capt. Hetherington of Cherry Valley, sold last year 58,000 pounds from his own apiaries. Adam Grim of Jefferson, Wisconsin, as much more. In fact, we might go on enumerating individual instances of the profitableness of this industry until we filled a whole column. But perhaps a better idea will be conveyed by more general figures. The 70,000 bee keepers of this country own on an average a little more than 28 hives apiece, or in round numbers two millions in all. Twenty-two pounds of honey to the hive is considered a reasonable yield of surplus, worth 25 cents per pound = $8,800,000 for the crop. The wax produced is estimated at 20,000,000 pounds, worth at least $1,000,000, making the grand total revenue presented us by our industrious little friends, annualy, $14,800,000. We annually export $1,200,000 worth of honey and $700,000 worth of beeswax.

The late Mr. Quinby, a most reliable author, in his work on bees, claimed that on an average every acre of ground would yield one pound of honey. The State of New York alone has 30,000,000 acres, yet she has never gathered more than 400,000 pounds. Just think of the loss! Honey being a sort of volatile oil evaporates if not gathered and "wastes its sweetness upon the desert air." Mr. Harbison says that the honey thus lost annually in California is of more value than the gold gathered! The profit realized by the keeping of bees averages from one to two hundred per cent. on the capital invested. It is a business anybody with limited means can carry on. Students frequently support themselves by keeping bees. Poorly paid ministers have often depended with more confidence for their daily bread upon these little industrious creatures of God than on their parishoners. There have been but two or three real progressive steps taken in bee culture since the days of Huber. In 1852 the Rev. L. L. Langstroth invented movable comb hives, by which we are able to buy those neat little boxes or caps we see at the grocer's. Later on came the extracting machine, which throws the honey from the combs by centrifugal force, leaving the combs intact so they can be put back into the hives and refilled by the bees. The greatest invention, however, has been reserved for this year.

Most every one has noticed how delicately and perfectly formed the honey combs are, so much so that no one ever dreamt they could be successfully imitated. But it has been done. Dr. John Long has constructed a machine that turns the combs out mathematically correct. The editor of "Gleanings in Bee Culture," says in his comments on these combs that "the finest specimens of comb made by the bees look cheap and awkward when compared to them." That our readers may be better able to appreciate the value of this invention, we will say that three-fourths of their time, the bees are busied making their combs and this, too, in the very honey-harvest time. Only one-fourth of their time is consequently being spent in gathering and storing the honey. Now that the combs are to be furnished them, and this three-fourths of their time saved and devoted to gathering in the wasting honey, the revenue from honey and wax will be enormously increased, is it any wonder that this little insect has been the chosen symbol of saving industry for years?

PARASITES ON BEES.

THE Rural World reports that at the last meeting of the St. Louis Academy of Sciences, Prof. C. V. Riley, the President, read a communication from G. W. Barnes of San Diego, Cal., in relation to parasites found upon bees in that State. The parasite was described as the color of a flaxseed and easily distinguished by the naked eye. It appears usually under the wing of the bee, and adheres with considerable tenacity. It occasionally crawls all over the bee, and is quite agile in its movements. The bees afflicted with the vermin become agitated and move rapidly over the comb, frequently dying of injuries. The parasites were first noticed there last year, and have again appeared this season, giving considerable trouble in large apiaries. Specimens of the insects afflicted accompanied the letter, and Prof. Riley said the parasite was the larva of the blister beetle. It was well known that these larva attach themselves to bees and were thus carried into the hive, where they usually left the grown bee and attacked the larva. Prof. Riley had not before heard that these insects injured the fully developed bees. The information was valuable, if reliable.

BEE ENEMIES.

DADANT in his Bee Book says:—"Never put a swarm of bees in an old hive, as there will almost certainly be the eggs of the honey-moth deposited in the crevices of the hive, which will hatch out and probably destroy the swarm. Nothing is more to be dreaded by the bee keeper than the moth, and when they once gain an entrance to the hive the bees appear as if powerless to expel them, although they will seize them savagely at the entrance. When moths have savagely at the entrance. When moths have once established themselves in a hive, and the maggots begin to eat their way through the combs, the sooner the bees are fumigated and put into another hive the better, as for them to remain with the moth maggots will be certain destruction to them. Moths as well as the large sing may be taken in great numbers, late on summer evenings, by spreading a mixture of sugar, home-made wine and rum, on the walls or the stems of trees.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

ELBERT S. CARMAN, - - Associate Editor.

X. A. WILLARD, A. M., Little Falls, N. Y.,
EDITOR OF THE DEPARTMENT OF DAIRY HUSBANDRY.

IT HAS A GOOD INFLUENCE.

THIS remark is often made in referring to the acts of individuals or a community, and we have only to regret that it is not more frequently the *motive* which prompts one and all in giving support to any scheme proposed for the public welfare. There seems, however, to be a little touch of fate attending any undertaking, no matter how good, pure and humane it may appear; just as the child in his free, rollicking feats over the green sward, crushes the life out of scores of innocent and beautiful creatures, all unknown though it may be to him or his older companions. The taking the lives of the insects cannot be called evil; but their fate, while the fun of the frolic, along with the exercise, may have a good influence upon the child's health and character.

We might, were it necessary, enlarge upon this subject of injury to one creature for the purpose of seeing a corresponding benefit to another; but every observing, thinking person, must have discovered that it is one of the inexorable laws of nature, consequently not to be gainsaid or avoided. Of course the influence of an act may extend far beyond the realms of human understanding; still we can usually see far enough to know whether it is beneficial or otherwise to those with whom we are associated, and this is what concerns us most.

In illustration of this point we call to mind the introduction of the English sparrows into this and other Eastern cities a few years since. Before that time a bird flying in the streets of New York was something seldom seen, and when by accident or otherwise one did appear, the boys of all classes—from the lowest ragmuffins up to the residents on Fifth Avenue, would to use a common phrase, "go for the poor thing" with sticks, stones or any missile at command. The result was that the children had no more idea of the natural rights of the feathered tribe than wild Arabs, and to capture and kill a bird or other harmless creature, was an act worthy of commendation. But when a few sparrows were let loose in our streets and the *fiat* went forth that they were to be protected by the aid of numerous policemen's clubs, there came a marvelous change in the demeanor of the youth of our city, and the rights of the birds were immediately respected. In fact, there has arisen a fraternal feeling between the children and the birds, and we doubt if one of the wildest of our wild "Street Arabs" would not resent an injury to one of the sparrows as soon as to one of his human companions.

Leaving out of the question all the good the sparrows may have done in ridding our city of noxious insects, as well as the almost intolerable nuisance of having such a vast number of birds nesting and scattering filth about dwellings and sidewalks, the influence of association upon each succeeding generation of children is worth a thousand times all the good they may have done in other directions, or the harm done to property. The children of our larger cities have been taught one great lesson in kindness if they never receive another.

The transition from sparrows and their influence upon the young, to the Society for the Prevention of Cruelty to Animals, is both natural and easy, and we make it all the more cheerfully as the latter is undoubtedly the greatest reformatory and humanizing organization in existence, and should receive the support of every man and woman who believe they have a soul and that animals can experience pain. It is not so much for the beast of burden that we would plead—for they can, at most, but suffer and die—but the man who is permitted to maltreat them with impunity gradually descends in the scale as a human being until, at last, he reaches a lower plane than the most ferocious brute. Immediate gain is an incentive to great cruelty with those who have no higher aspirations than to satisfy their own animal needs and passions, and from free indulgence in maltreating beasts of burden it is but natural that the same disregard for pain or life would be extended to human beings. This is so well known that neither facts nor theories are required in support of the assertion, and we have only to follow the man who is cruel to animals to his home to find the evidence of cruelty to his family; consequently we repeat, that the Society named is worthy of the support of every man and woman in the land, because it has a good influence upon those who are bad enough now, but would be far worse without it.

Cruelty is a passion which can be encouraged, increased and transferred from one generation to another until it becomes hereditary in a family or nation; hence the importance of checking the hydra-headed monster by force, if necessary.

PLAGIARISM.

ALL thefts are not alike in degree of wickedness. It is a question whether a mother who steals a loaf of bread for her hungry child is guilty of any sin whatever. In this view, the degree of culpability should be estimated not by the value of the thing stolen, but by the necessity which constrains a person to steal it. Necessity, therefore, and the degree of selfishness prompting the act are the measures of the wickedness of theft. Whence it follows that stealing in one of its most inexcusable forms is that in which an able-bodied individual choses this as his means of livelihood—as his business. One of the meanest phases of this contemptable business is plagiarism. There are many journals in this country that would no sooner steal a newspaper article than they would a dollar. There are others who steal articles precisely as if there were no sin or even disgrace attached to such an act.

The sphere of journalism—presumably—is to teach. Some journals select special fields—agriculture, horticulture, science, literature; but all of them, whatever their usual field, set themselves up, more or less conspicuously, as teachers of morality. With what consistency they can teach morals with stolen material is a question that answers itself as soon as asked.

There are two fashionable forms of literary theft to which we wish to call especial attention. One is that of stealing ideas—clothing them in original language and presenting them as their own. The other is to copy an article with the *writer's* name, without any mention of the journal in which it first appeared and for which it was written. Thus, JONES writes an article for the RURAL. JONES either gives it or sells it to the RURAL, and this article in either case is just as much the RURAL's property as the paper upon which it is printed. JONES, having given away or sold this property, has no longer any claim to it whatever. Now the Alaska Farmer copies it, appending JONES' signature alone as if that gentleman had either given or sold it to the Alaska Farmer, and this, of course, is the impression produced and intended to be produced in the minds of the readers of that paper. Mr. JONES is in no way censurable, and, as has often happened to many other JONES', may open his eyes in surprise to find his name and composition in papers to which he has never and would never have contributed.

As to whether this class of plagiarists—and we may comprise under it another and larger class who steal without *any* credit—as compared with those who steal *ideas* alone, disguising them beneath synonymous language, are the more reprehensible, judgments may vary.

Our own impression is that, if the hair is to be split at all, a liberal judge would view with less severity the out-and-out thief than he would the sneak who with infinite, shame-faced pains seeks to smooth over all tell-tale tracks. Yet if individual instances were fairly investigated, it may be, that in either class it would be found that the degree of culpability was so softened by circumstances as to approximate the case of the poor woman who stole a loaf for her child, in that the editors were either obliged to steal or starve. This being proven, a hopeful proceeding would be the renunciation of editorial duties in favor of earnest physical application either in practical agriculture or the lesser mechanic arts.

Another discreditable method of copying articles though it cannot be considered a plagiarism, is that of crediting the copied article to "Ex." (Exchange). A. borrows a sum of money of B. He acknowledges he borrowed a sum of money; he uses it for his own benefit but fails to pay it back. The paper that borrows does not steal—it merely fails to pay back that which it borrowed. It is a good rule never to seek the company of those with whom we would blush to be seen if among our most respected friends. Is is just as good a rule not to borrow of those to whom we are ashamed publicly to acknowledge our indebtedness.

We do not wish in any way to be personal. In truth it is to avoid the necessity of being personal that the above is written. We will freely say for ourselves that, while the RURAL NEW-YORKER is gratified to have its articles republished with due credit, it cannot afford to have them stolen—and if it could so afford, would still deem it a duty to denounce this form of theft even more severely than other forms, inasmuch as those who perpetrate them have not the excuse of ignorance or of those evil influences of the associations to which other professional thieves in most instances are from boyhood subjected.

We have from time to time collected a quantity of extracts which have been stolen from our columns exemplifying the types above alluded to. And we give respectful if not affectionate notice that if those journals do not speedily mend their ways, we shall publish their names without fear or favor and without further warning.

RURAL NOTES.

Heat in New Jersey.—A minister communicates the following to the Pacific Rural Press. It may seem an exaggeration; but remember a minister wrote it and if his word is not sufficient and ours will add anything, we are ready to make an affidavit to its exact truth:—"For four weeks we have had not one drop of rain. For over two weeks the thermometer has reached 90 every day. My beautiful garden "sass" is completely burnt up. The mossy turf in the front yard bears the appearance of a much-frequented beer garden. The flower beds are like last Christmas' decorations. The thermometer in my study got so high last night that it is now suffering from acute and merited delirium tremens. We boil eggs by immersing them two minutes in the well. Black broadcloth burns spontaneously between here and the post-office. Ice is 75c. a hundred. It melts at the rate of 100 a minute. Collars starched to the verge of imporosity are reduced in five minutes to spissitude. Incrassated linen cuffs languish in half that time. STEPHEN H. TYNG, Jr., told me that he used seven clean shirts last Sunday! [This alone we cannot vouch for.] We are obliged to keep the baby in the refrigerator. A two hours' drive brings milk to the door in the shape of Dutch cheese. The butchers deliver only roasted roasts." A delicious rain has changed all this—the baby has been taken out of the refrigerator and New Jersey breathes again.

Cooking as a Science.—An eccentric millionaire in Massachusetts proposes to found an institution for educating "servants and cooks," at least so runs the announcement. But if this be his object then the institution should be located in Ireland instead of America, for it is always well to go to the fountain head of supplies when seeking improvement and purification. If the gentleman desires to improve American cookery let him found a popular institution for instructing women who do not expect to become servants, but wives and managers of households, thereby qualifying themselves to direct and teach their servants the gastronomic art. "A skillful master makes skillful workmen," is as true here as elsewhere.

A Quiet Excursion.—Within fourteen miles of this city, on the line of the N. Y. & N. J. R.R., grow immense quantities of blackberries now ripe and ripening. They are most abundant upon the west bank of the Hackensack river. We suggest to our city readers that they go thither for a day of recreation. After picking all they need of blackberries there are pleasant little groves and belts of shady trees in the coolness of which what remains of the day may be quietly spent. Or there is the river in which to bathe. Would not this be pleasanter, more sensible than visiting the "professional" groves in which a crowd of people, lager-bier and ice-cream are among the chief attractions?

RURAL BREVITIES.

WILL MRS. ANNIE H. FROST please favor Editor of RURAL with her present address? We should also like to hear from MRS. C. H. CRESSWELL.

NEWS.—The London Garden says, "The Potato bug has *again* made its appearance in America." Alas, that the blessed period of its disappearance should have escaped us!

THE Kansas Farmer says, "No high official in Kansas has ever suffered the penalty of the law for his crimes committed while in office, from County Treasurers up to United States' Senators." Kansas must be a grand place for official rogues or rogues in office.

WE learn from the Syracuse Journal that the veteran Pomologist, F. R. ELLIOTT, attempted suicide in that city a few days since, but whether for the purpose of getting a little free advertising or because he was really sick of this mundane sphere, is beyond our range of knowledge.

THE lottery swindlers are likely to come to grief, as the Post-office Department instructs postmasters that circulars relating to lotteries should not be delivered but destroyed. This may hurt some of those highly respectable journals which depend largely upon the lotteries for support.

A VIRGINIA PLANTER, in preparing beds for sowing tobacco seed, uses kerosene oil instead of wood. He says that applied to the soil with a watering-pot, it costs less than wood and is fully as effectual in destroying weeds, insects, and putting the soil in the best condition for the reception of the seed.

A TEXAS Grange recently passed a resolution instructing the secretary to burn all lottery circulars sent to the Grange, and also requests all members receiving them to treat them in like manner. To this resolve let the Patrons add a refusal to subscribe for or in any way support a paper which admits advertisements of lotteries and they will save thousands of persons from the sin of gambling.

THE question as to whether some kinds of snakes protect their young by permitting them to pass down their throats, is still being discussed very vigorously among the naturalists of Great Britain. Perhaps these wise men might get a sight of an old black snake taking down a dozen young ones without inconvenience, if they would spend a summer on the borders of some of our big swamps. Country boys are too familiar with this "snake-swallowing" for protection to have any doubt about it.

TO A GRASSHOPPER.

TINY, pea-green harlequin!
What of wonder can describe
All your odd, gymnastic tribe,
To the kangaroo akin?
Unless Darwin goes amiss,
With his queer hypothesis.

Chirping chimer, clover climber,
Insect athlete! never stumbling,
In your ground and lofty tumbling.
Strange it is a thing so fragile,
Should be so extremely agile.

Go it, then, spasmodic leaper!
Seize your pleasure while you may;
Blow your horn and have your day;
When the primrose days are over,
And all dead are vines and clover,
That austere, remorseless reaper,
Time, will turn us all to hay!

When October,
Like a varlet,
Robs the woodland's summer dress;
And the maple, blushing scarlet,
As the ruffian winds disrobe her,
Shrinks in timorous distress;
When no longer leans the lily
By the mill pond's mossy edge,
And an influence damp and chilly
Blasts the rose and daffodilly,
And the vines along the ledge
When the cricket
Leaves the thicket
To creep under kitchen rugs.
Then, O mountebank of bugs,
Unique acrobatic vaulter,
Your frail powers will fail and falter;
And some chill, autumnal morning,
Lying, dying,
Without warning,
You will find it useless trying
Leaping, creeping, singing, flying;
With some early robin waiting,
Cool and calm, and aggravating,
Like some grim and hungry wizard,
Obviously deliberating
When to pop you in his gizzard.
Farewell butterflies and clover,
Death is fate the wide world over.

[Golden Rule.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

(Continued from page 77.)

THE Plymouth Company were unsuccessful in establishing any settlements or inaugurating any enterprise of importance, and in 1620 King JAMES I. incorporated the Duke of LENOX, the Marquises of BUCKINGHAM and HAMILTON, the Earls of ARUNDEL and WARWICK and others, to the number of forty—noblemen, knights and gentlemen—by the name of the Council of Plymouth, in the County of Devon, "For the planting, ruling and governing of New England, in America." The patent covered "All that part of America lying between the 40° and 48° of latitude and from sea to sea." From this Company the different colonies of New England received their titles, which were approved and confirmed by the throne.

In 1628 the Massachusetts Bay Colony received a grant of all that territory lying within three miles north of the Merrimac River and three miles south of Massachusetts Bay and Charles River and from ocean to ocean.

The Plymouth Colony in 1630 received a grant covering lands between the Cohasset River on the north and the Narraganset on the south, and also of lands on the Kennebec.

It remained a separate Government until 1688 when, by charter of the King, it was united with Massachusetts Bay.

The original patent of Connecticut was granted by the Plymouth Company in 1630 to the Earl of WARWICK, and in 1631 he conveyed all the territory extending west from the Narragansett River, southwesterly toward Virginia 120 miles by the coast, and in all the breadth thereof to the western ocean. This has been construed to embrace as far north as Worcester, Mass.; south, including all of Long Island, and west in the same breadth from Narragansett River to the Pacific Ocean.

It is not necessary for our present purpose to examine the reasons for the making and changing the dividing lines between the colonies, the title of Great Britain to the country granted by the treaty of 1783 being all that is pertinent to our present inquiry.

In 1609, while CHAMPLAIN on behalf of France, was exploring Northern New York, and JOHN SMITH under English authority, was examining the various rivers of Virginia, HENRY HUDSON, an Englishman, in a vessel called the Half-Moon, fitted out by the Dutch East India Company, coasted along the Atlantic Coast in search of the much-desired northwest passage to India. Passing northward from the Virginia Capes, he entered Delaware Bay and afterward went through the Narrows into the bay of New York and up the river that still bears his name. On his return to England he was forbidden by the Government to continue in the employ of the Dutch Company; but having forwarded to them an account of his voyage and glowing descriptions of the country, a ship was sent out to trade which, meeting with good success, was soon followed by others.

In 1614 a rude fort was built on Manhattan Island and forts and trading houses erected up the river as far as Fort Orange, now Albany, and a company—the Dutch West India Company—was formed. Colonization was not anticipated, only trade. The States-General granted the Company authority over the country from Cape May to Nova Scotia and named it New Netherlands. Thus it appears that this territory was then claimed by French, English and Dutch.

In 1635 about thirty families of French Protestants, or Walloons, who had gone to Holland to escape persecution, concluded to emigrate to the New World. Some went up the Hudson or North River; others settled in Brooklyn near where is now the Navy Yard, on a bay—or bought—which was called the Walloon's Bought, since corrupted to Wallabout. The land adjoining from its general rolling character, so different from Holland, was called Breuken Land—now Brooklyn.

The agent of the Company located on Manhattan Island, which had been purchased from the Indians for $24. A few cottages were erected at the south end and honored by the name New Amsterdam.

In 1638 a colony of Swedes settled on the shores of the Delaware, on territory that had been purchased of the Indians by the Dutch and was claimed by them, as well as by French and English, by right of discovery. This colony, after seventeen years, was compelled to submit to Dutch rule.

In 1664 CHARLES II., ignoring the rights of Holland as well as those of the people of Connecticut under their charter, gave to his brother, the Duke of YORK, the entire country from the Connecticut to the Delaware. The Dutch were not aware of this until an English fleet was in the bay, Long Island in possession of the English, and recruits from New England had pitched their tents in Brooklyn. Making a virtue of necessity, the Dutch surrendered—New Amsterdam was named New York; Fort Orange, Albany. Once again the Island of Manhattan was under Dutch dominion. During a war between England and Holland a Dutch fleet sailed up the harbor and the colony was New Netherlands; but with the return of peace, a little more than a year after, English authority was acknowledged and the Dutch dominion in New Amsterdam terminated.

From this time English supremacy on the Atlantic coast was universally acknowledged.

Religious enthusiasm carried the French into the heart of America. Soon after CHAMPLAIN had made permanent settlements in Canada and had carried his explorations as far south as Central New York, by his invitation numerous Jesuit missionaries went to Canada with the desire and design to Christianize the natives. Going westward we find Father ALLONES in 1665 among the Chippewas, whom he soon claimed as subjects of France. He had among others as an assistant in his labors, JAMES MARQUETTE, a zealous Jesuit, a faithful worker and a good man. The Indians south of the St. Lawrence, Lake Ontario and Lake Erie, did not welcome the missionaries, but those on the northern shores received them kindly.

In 1671 NICHOLAS PEROT appeared at St. Marys, on the stream that joins Lakes Superior and Huron, just as MARQUETTE was about to leave that place to explore the Mississippi River, of which he had heard from Indians. PEROT bore authority from the French King to convene a general council of Indians at St. Marys. They assembled from all the sections the Jesuits had penetrated—from the eastern waters of the St. Lawrence and from beyond the Mississippi—and were informed that their father, the King of France, had taken them under his paternal protection and that thenceforth they were his subjects. A cross was raised to typify Christianity and beside it was planted a post on which was placed the arms of France.

The expedition to the Mississippi was, in consequence of this meeting, postponed till 1673, in which year JOLIET, MARQUETTE and five other Frenchmen, with two Indians as guides, reached the Wisconsin River and followed it to its junction with the Mississippi, down which they proceeded, making their first stay on the Iowa side near the mouth of the Des Moines. Again embarking they floated below the mouth of the Arkansas, and so far that they were satisfied the river flowed into the Gulf of Mexico. Returning, they entered the Illinois River, which they ascended to its source, and thence proceeded by way of Chicago and Lake Michigan to Green Bay.

In 1682 LA SALLE left Chicago and descended the Illinois and Mississippi to the Gulf of Mexico, claiming dominion of the whole valley of the Mississippi for France and naming it Louisiana, in honor of Louis XIV.

In November, 1698, LEMOIR D'IBBERVILLE sailed from Canada with nearly 200 colonists, intending to make a settlement at the mouth of the Mississippi, and in January, 1699, he anchored before the Isle of Santa Rosa. At Pensacola, on the opposite shore, 300 Spaniards from Vera Cruz had, a short time before, built a fort. Finding this preoccupation he sailed westward, touching Massacre or Dauphin's Island, southwest of Mobile Bay, and soon after discovered the mouth of the Pascagoula River. Leaving there most of his colonists IBBERVILLE, with a few men in boats, went in search of the mouth of the great river, which they found by following a current of muddy water in which they saw logs and branches of trees floating. He then went up the Mississippi to the mouth of Red River, where he was given a letter addressed to LA SALLE, which had been preserved by the Indians fifteen years and given to him, the first white man they had seen after its reception.

As the shores of the Lower Mississippi were marshy, the idea of settling on the river was abandoned and the colony remained at the mouth of the Pascagoula, there establishing the first French settlement on the Gulf of Mexico. True, DUMONT in his "Memoirs of Louisiana," says "the first settlers of Louisiana were Canadian voyagers who had got some goods from citizens of Quebec to go and trade among the Iroquois and Hurons; but after using them as their own they were afraid to return home after such a piece of business and, reaching the Illinois, they descended the river St. Louis, now Mississippi, and landing on Massacre, or Dauphin Island, settled there." None of the other authorities I have examined mention this, and as the Island is so far from the mouth of the Mississippi, it is highly probable DUMONT is mistaken in his locality, if not in his facts.

The French now had possession of the entire length of the Mississippi and a line of fortified trading posts were soon established, extending from the Gulf of St. Lawrence to the Gulf of Mexico. Spain asserted a right by discovery to the lower Mississippi Valley, but the possession of France was paramount.

Louisiana, as claimed by the French in 1730, included the entire valley of the Mississippi and of its tributary streams on either side. This embraced all country west of the Alleghanies, including the head waters of the Monongahela, Allegheny, Tennessee, Kane and Cumberland Rivers. The southwestern limit was the Bay of St. Bernard and the Perdido River was its eastern boundary on the Gulf.

Strenuous efforts were made by the French to extend their power throughout the valley of the Ohio. The Indians were not happy under this state of affairs and caused much trouble, while the English colonists viewed with alarm the approach of the French toward their settlements and the occupation by them of lands included in charters granted by the British crown which, it will be remembered, in most cases, covered the country from ocean to ocean. Continued collisions, together with other causes, led to a war between the two nations declared in 1754, which continued eight years, and notwithstanding Spain joined with France against Great Britain, the latter power, by gaining one after another the French strongholds in Canada and the stations and military posts in the valley of the Ohio, finally compelled France to seek peace at the cost of the loss of her dominions in America, while Spain at the end of the war, beside other losses, found England in possession of Havana.

In 1763 France ceded to Great Britain all of Canada and its dependencies and all the territory she possessed east of the middle of the Mississippi River from its source to the Ibberville, thence through the middle of that river and lakes Maurepas and Pontchartrain to the sea, leaving the city of New Orleans and the island on which it stands out of the cession, but declaring the navigation of the Mississippi from the Gulf upward, free to both nations. At the previous date (1762), by secret treaty France had ceded to Spain all of Louisiana not described in the cession to Great Britain just mentioned.

In 1783 Spain gave Great Britian all of Florida in exchange for the re-possession of Havana. Thus England became possessed of all east of the Mississippi except the city and island of New Orleans, which was the extent of her American possessions at the breaking out of the Revolution in 1775.—[To be Continued.

The Story-Teller.

BIBBS---A LOVE STORY.

CHAPTER I.

THERE was no doubt about it—John Weare was perfectly wretched that night. He had quarreled with Jennie Bell and he wasn't going to make it up. The fact was, she gave herself too many airs and he didn't mean to stand it any longer. He didn't care if she *was* pretty—that was no reason why she should let half-a-dozen fellows hang about the shop or stroll in one at a time and, leaning on their elbows, chatter and smirk and smile over the counter; cadets and officers too, wild young fellows, who only did so for their own amusement and would no more dream of marrying her than they would of inviting her to the ball that was coming off next month. To be sure, he was only a common cavalry soldier; but then he had been in the service a good many years now, had an excellent character and a good trade at his back and, moreover, his father had died not long since, and there was the cottage all ready for Jennie to walk into and they might settle down at once if she'd only be sensible.

Jennie acted as shop-woman for her sister, Mrs. Evans. A very poor little shop it was, very small and badly stocked, for Mrs. Evans had only managed to get a few pounds' worth of things with what had been subscribed for her in the garrison after the fever had carried off her husband. The speculation answered pretty well at first, for many of the officers' wives, knowing what an industrious woman Mrs. Evans was, made a point of buying their tapes and cottons and sticks of sealing wax of her. Then Jennie's pretty face was behind the counter and the shop was filled from morning to night with officers and frisky young cadets and the original customers took flight—though Mrs. Evans did not know it, for she, believing the business was safe in the keeping of Jennie, worked hard at the dressmaking (she had three children to support and the shop alone would not do it.)

The officers were not profitable customers, for they only went to flirt with Jennie under the excuse of buying a penny paper or perhaps asking for a time-table. Jennie made the most trim and pretty and obliging of shop-women and the place itself was always a pattern of neatness; but the officers' wives did not care to go and buy their threads where they were evidently interrupting a flirtation, and so the business continued to fall off and Mrs. Evans began to get quite uneasy about it. Jennie—pretty, kind-hearted, thoughtless Jennie—had no idea that she had anything to do with it, or she would have sent every one of her admirers off at a pace that would have astonished them. She had been only too delighted, after her brother-in-law died, to come from Devonshire and live with her sister at Woolwich—not only because she was very fond of her sister, but also because she had wished many times to see John Weare again. She had made his acquaintance when her brother and he—for they had been in the same regiment—were stationed at Plymouth and she had paid them a flying visit with her father.

John had told her then that he was tired of the service and wanted to settle down, and she inwardly thought that he could not do better than ask her to settle with him. He had been very attentive when she came to Woolwich and gradually established himself on the footing of a lover, till he found the shop always filled with officers and cadets. At first he was shy of appearing before his superiors, then he got jealous and at last angry; for he felt and knew that they meant her no good and besides, it was doing real injury to the business of the shop. At last he spoke his mind, and told the coquettish Jennie what he thought and was snubbed for his pains.

"If you think I don't know how to take care of myself, Mr. Weare, you are much mistaken, and I don't want any one to tell me what's right or wrong. I know myself."

"Well, Miss Jennie, I didn't mean to give offense. I only told you what I thought."

"Then you might have kept your thoughts to yourself," she said, with a little toss of her pretty head—"unless they had been nice ones," she added. He heard the aside and picked up his courage.

"It's awfully hard, too, when one that cares for you really can't get near you," he pleaded.

Just then Jennie caught sight of Captain McGee, a tall and handsome man, with long whiskers and a red nose, coming in the direction of the shop with a big bunch of flowers in his hand. She had heard John Weare's last words; but she was secretly of opinion that "he ought to have come up to the scratch before," so she thought a little jealousy might do him good.

"Oh, here comes Captain McGee!" she said, in a delighted tone.

"Well, he's just the biggest blackleg in the service Jennie, and if you take my advice you'll send him off sharp."

"I believe you are jealous, Mr. Weare, and telling stories about the captain; he is always very polite to me," and she smoothed her pretty hair and arranged the trifles on the counter.

"Oh, he's polite enough, no doubt."

"And he's bringing me some flowers."

"Now look here, Jennie; are you going to take them?"

"Of course I am."

"Well, then, good-by."

"Good-by," she laughed. Of course she knew he wouldn't go.

"Jennie, he'll be in directly and I shall be off; but you must choose between him and me. If you are going to keep on talking to him, I shall never come in the place again—so which is it to be?"

"The captain."

"But I am not joking. I'll never see you again."

No more am I joking; so good-by."

"Good-by"—and he went.

CHAPTER II.

He kept resolutely away for a whole month—never once went near the place. If Jennie wanted him, she might send for him or get her sister to invite him to tea, as she had done before. But John Weare was not sent for, neither was he invited to tea, and his spirits began to wax low.

"If she'd cared a dump about me she'd have got in my way somehow before this—trust a woman," he thought.

The idea of not being cared for, even to the extent of a dump, was not cheerful. That night he strolled carelessly by the shop, but on the opposite side of the way. Nothing was to be seen of Jennie. He walked on in a brown study and went deliberately by the shop with only one eye, however, turned in its direction, but not a sign of Jennie. He went on to the barrack in a dejected frame of mind.

"It's an awful pity—such a nice girl; and the cottage all ready for her to step into and me ready to retire from the service and a good trade at my back; it's too bad, and all along of that Captain McGee, too. And the fruit in the garden (of the cottage) all ripe and no one to pick it."

The very next morning John Weare walked deliberately into the shop and asked for a penny newspaper and had the felicity of being served by Mrs. Evans.

"Quite a stranger, Mr. Weare," she said; but that was the only remark she made, and for the life of him he could not screw up his courage to ask for her sister.

That night John Weare was miserable.

"She can't care a rush for me," he thought and marched all over the town and nearly to Greenwich and back, in his excitement.

The next day was a lucky day for John. He came across Bibbs. Bibbs was Mrs. Evans' eldest boy. No one knew what his real name was or why he was called Bibbs; but he was never called anything else.

"Bibbs," said John Weare, "come and have some fruit;" and he carried him off in triumph to the cottage and stuffed him with gooseberries till he couldn't move and with black currants till his

mouth was as black as a crow. Then he carried him inside and stood him on the table and sat down before him.

"How old are you, Bibbs?"

He thought it better to begin the conversation with a question.

"Five and a half. Is that your sword up there?"

"Yes. Who gave you those bronze shoes, Bibbs?"

Now he knew that Jennie had given them to him, but he so wanted to hear her name.

"Auntie. She's going away soon," he added. "Let me look at your sword now."

"Where is she going to?" he asked, in consternation.

"Devonshire. Do let me try on your sword."

"Why is she going?" he asked, with a sick feeling at his heart.

"She's ill, I think; and she's always crying now. One day she was crying over the silver thing you gave her and kissing it like anything."

The "silver thing" was a little heart of about the size of a shilling, which he had bought at Charlton Fair last October and timidly requested her to accept.

John Weare jumped up and showed Bibbs his sword and carried him on his back all over the place and entreated him to have more black currants, in his delight. But Bibbs declined.

"Aunt Jennie's going to bring me some from Eltham to-night."

So Jennie was going to Eltham, was she? John Weare took Bibbs home, and on his way presented him with a white woolly lamb that moved on wheels and squeaked and a monkey that went up a stick on being gently pushed.

"Crying over her silver thing!" said John Weare. "I'll go and hang about the Eltham road till I see her and beg her pardon."

And he went and Jennie met him and pouted and declared she hadn't once thought of him and then broke down and cried. And John begged her pardon and declared that he had been a heartless brute; and then Jennie contradicted him and said it was all her fault, and told him how Mrs. Dunlop, the colonel's wife, had one day walked in and told her in the kindest possible manner that she was spoiling her sister's business, for the ladies who had been interested in her welfare kept away on account of Jennie's flirting propensities, which filled up the shop with idle officers who were always in the way; and how she had been so ashamed and wretched and so cut up at the desertion of John Weare, that she had determined to go back to Devonshire.

"But you won't, now?" he said, as they leaned over the stile leading to the Eltham fields. "You'll get ready at once and we'll be married as soon as possible, before the fruit in the garden is spoiled?"

It took a long time for him to talk her into it—about three-quarters of an hour; but then she was very happy at heart and chatted like a young magpie, and told John how she had snubbed Captain McGee and had thrown all his flowers out of the window.

"And it really was all through that dear Bibbs that you waylaid me to-night?" she asked.

"Certainly."

"Why, but for him I might never have seen you again."

"Perhaps not."

"I'll give Bibbs a regular hug when I get home," she thought; and she did. And the day before she was married she bought him a rocking-horse, which he delights in to this day.

HINTS FOR THE TRAVELING SEASON.

At this season many persons contemplate traveling; to do so with the largest amount of comfort and advantage—physical, social and mental—the following suggestions are made:

Take one fourth more money than your actual estimated expenses.

Acquaint yourself with the geography of the route and region of travel.

Have a good supply of small change, and have no bill or piece higher than ten dollars, that you may not take counterfeit change.

So arrange as to have but a single article of luggage to look after.

Dress substantially. Better to be too hot for two or three hours at noon than to be cool for the remainder of the twenty-four.

Arrange, under all circumstances, to be at the place of starting fifteen or twenty minutes before the time, thus allowing for unavoidable or unanticipated detention on the way.

Do not commence a day's travel before breakfast, even if that has to be eaten at daylight. Dinner or supper, or both, can be more healthily dispensed with than a good, warm breakfast.

Put your purse and watch in your vest pocket and all under your pillow, and you will not be likely to leave either.

The best if not entirely secure fastening of your chamber door is a bolt on the inside; if there is none, lock the door, turn the key so that it can be drawn partly out, and put the wash-basin under it; thus, any attempt to use a jimmy or put in another key, will push it out and cause a racket among the crockery, which will be pretty sure to rouse the sleeper and rout the robber.

A sixpenny sandwich eaten leisurely in the cars is better for you than a dollar dinner bolted at a "station."

Take with you a month's supply of patience and always think thirteen times before you reply once to any supposed rudeness, insult or inattention.

Do not suppose yourself specially and designedly neglected if waiters at hotels do not bring what you call for in double quick time; nothing so distinctly marks the well-bred man as a quiet waiting on such occasions; passion proves the puppy.

Do not allow yourself to converse in a tone loud enough to be heard by a person two or three seats from you; it is the mark of a boor if in a man, and of want of refinement and lady-like delicacy if in a woman. A gentleman is not noisy; ladies are serene.

Comply cheerfully and gracefully with the customs of the conveyances in which you travel and of the places where you stop.

Respect yourself by exhibiting the manners of a gentleman and a lady, if you wish to be treated as such, and then you will receive the respect of others.

Travel is a great leveler; take the position which others assign you from your conduct rather than from your pretensions.—*Hall's Journal of Health.*

The Literary World.

NEW PUBLICATIONS.

The Historical Jews of Nazareth. By M. SCHLESINGER, Ph. D. [12mo.—pp. 98; $1.] New York: Chas. P. Somerby, 139 Eighth street.

THERE are books which are *con*structive and books which are *de*structive—books which, if they pull down one cherished faith, proffer what is believed to be a better one, and books which simply deny, asserting only the everlasting No. Such is the work under notice. The writer is the rabbi of a prominent Jewish congregation at Albany, N. Y., and as Jewish theological works are rather scarce—at least with us—we read the work carefully, but ended it with a feeling of intense disappointment.

It is not within the province of this paper either to attack or defend any system of theology, and we must confine ourselves mostly to a statement of his views, with brief comment, that our readers may learn what an educated Jew really does believe in.

He traces the vitality of the Jewish race to their "Messianic idea." We doubt whether that is the true name for the "idea" that is most powerful in swaying the Jewish mind and would suggest that, if the thought be a true one, he has not probed it to its depths. They believe they are to be the saviours of the world, he says; yet, what have they done, since Christ was born, to save it? Here and there many have arisen and made themselves famous among men, but the mass have only a physical vitality, and because of smaller numbers and a *positive distinction* to proselyting—refusal to become the savior our author says they believe they are to be—without influence on the mental condition of the world. Nor do we perceive any indication that either by increase of numbers or intelligence they ever will have influence—or that they have desired, or do, or will desire, such influence.

Asserting the might of the idea of a *coming* Messiah, he resolutely shuts his eyes to the far grander results following a belief in the Messiah that *has* come. Asserting the obscurity of CHRIST'S birth and the insignificance of his first followers, he sees nothing wonderful in the millions who now believe in him. Jewish history has nothing like it. The people who received the law from Sinai were many times more numerous than the disciples of CHRIST were a hundred years after his death. What are their relative proportions now? If there be such force in the Messianic idea, does it not seem as if the Christian and not the Jew, had perceived and realized it?

Possessing a spirit of *scientific* research—the usual euphemism for universal skepticism—and seeming to forget (we all of us do forget at times) how much the prejudices of his whole life unfitted him for a fair judgment, he eagerly strikes hands with the German rationalist STRAUSS, who once boasted, "we have advanced from knowing a little about CHRIST to knowing nothing," and does not perceive that he has joined himself to a company who will take the arguments he uses and turn them against *his* faith—saying the supernaturalism he denies in CHRIST is as absurd in MOSES—that if the miracles of CHRIST lack evidence, so do those Jewish history is full of. While to the CHRISTIAN he is an unbeliever, the school he has joined sneer at his credulity.

As was to be expected of a man so trained and using such teachers, our author finds nothing remarkable in the life of CHRIST. JOSEPHUS does not mention him; therefore, though several Pagan writers do, it is of no consequence. He cannot believe the magi had any supernatural intimation of CHRIST'S birth, but believes *they learned it from the stars*. He thinks JESUS was a common man; yet, even if we reject supernaturalism and read his life as a simple history, we shall find none like it, and we once heard an infidel say, "If the gospels are true, they reveal a wonder; if not true, who could have devised a character so impossible of human conception?" But, like our author, he was content to wonder at the lie rather than accept the truth. Our author finds nothing supernatural in CHRIST'S miracles. He sees marvelous virtue in faith. "Those who believed were easily cured." He does not perceive that faith still has power, for men are men still. He sees nothing remarkable in his death and contemptuously dismisses the resurrection as witnessed only by MARY MAGDALENE "a nervous, amorous, excited woman," and "MARY saw him," all the evidence the disciple had. He does not seem to have read the last chapter of LUKE'S Gospel.

He asserts that PAUL is the real founder of Christianity, the Gospels being written either to support or oppose PAUL. He says the Book of Revelations is an attack on PAUL.

We must close. The book is a remarkable one as to its utterances, not its spirit. We do not think it will unsettle Christians; if it should, he offers no substitute for Christianity. His last few words, asserting that Christianity is being absorbed by Heathenism, are only an illustration of what absurdities "scientific" men can be guilty of. There are no facts to prove this now; doubtless they can be invented when needed.

Two Years in California. By MARY CONE. (8vo.—pp. 228; price, $1.25.) Chicago: S. C. Griggs & Co.

THE author thus vigorously cites the evidence of her impartiality:—"There has been much that was partial and untrue written in regard to California. The writer lays no claim to infallibility, but does claim that during two years spent in California, she made an honest effort to see things as they really were and has tried to describe them as they appeared. Bought up by no corporation, never dead-headed, protected by insignificance from all ovations whatsoever, there was nothing to cast a glamour over the eyes or bias the judgment except so far as the loving-kindness of friends brought content to the heart and opened pleasanter and fuller facilities for seeing and knowing."

With this principle in view the author has produced rather a remarkable book than otherwise—remarkable for a woman. It contains a mass of statistics which are so interwoven with interesting facts and pleasant reading as to lose all their dryness. No one who reads the work carefully can fail to have an excellent idea of both the advantages and disadvantages of a residence in California, which is to-day a comparatively unknown region to many of our Eastern people. That the State has exceptional advantages to the agriculturist there can be no doubt and nowhere have we seen these more clearly set forth than in this work. It is beautifully illustrated and printed in clear type on handsome paper. The publishers have done their part well.

The Pilot and his Wife. A Norse Love story. By JONAS LIE. Translated by MRS. OLE BULL. [8vo. —pp. 336. Price, $1.50. Chicago: S. C. Griggs & Co.

To the more Southern reader—the denizen of a warmer climate—there is always something refreshingly strong in the literature of the colder climate. The people seem to be—nay, are made of sterner stuff, probably the result of a more sterile land and the habit of conquering the greater obstacles which Nature has thrown in the path of their existence. Among the most vigorous of the Scandinavian writers is JONAS LIE, the author of the work before us, which has been so well rendered into English by the translator. To the lover of our modern "gush" served up in novels of the present day, we should say throw it aside as somewhat heavy and stupid; but from those who read for information as well as amusement it certainly merits a perusal. The glimpse of Scandinavian low life must be truthful, and is an interesting study. The character of the reckless, stern old fisherman, with quite as much bad as good in his composition, is so finely drawn that one's interest is held throughout.

Achsah. By Rev. PETER PENNOT. (8vo.—pp. 368; price, $1.50.) Boston: Lee & Shepard.

THIS is another novel from the pen of a Minister of the Gospel and, like a majority of such works, largely made up of church matters and church people. Of course it is but natural that the author should write about that which he knows most; but it seems quite unnecessary for him to follow the great fault of nearly all ministers' novels, viz.,—the exaggerated contrast between the good and bad in daily life to such a degree as to amount almost to a double caricature. While this is an interesting story and is smoothly written, we wish his good people had been a little less good and his bad people a little more like others. Upon the whole, it is far above the average novel of the present day and certainly points an excellent moral. Some orthodox people may think it a trifle too liberal; but the world develops each day and never retrogrades. The work is illustrated with good and appropriate wood cuts, some of which quite enter into the author's spirit of excessive good and bad.

Roadside Poems for Summer Travelers. Edited by LUCY LARCOM. (Pp. 263; price, $1.) Boston: Jas. R. Osgood & Co.

THE tendency of modern bookmakers is toward compilation and a reputation for excellence of selection has now become almost as desirable as one for good writing. Material is always at hand and the light readers in this busy era are generally glad to have their mental food culled for them. Hence the active demand for such little volumes as the one before us. Originally designed for a pocket companion to the mountain traveler, the editor seems to have drifted naturally into selections suitable for all times and places. Glimpses of what is best and purest in nature from the pens of the greatest English and American Poets are here reproduced. A glance upon any page cannot fail to convey to the mind of the reader food for enjoyable thought. The convenient size of the work will render it a welcome comrade to travelers.

The Complete Poetical Works of Henry Wadsworth Longfellow. [Large 8vo. pp. 281.] Price, $1.50. Boston: James R. Osgood & Co.

THIS is one of the Cheap Editions of the Poets published by this enterprising firm. They should have the thanks of the middle class in this country for the inauguration of so commendable an undertaking. Of course it is unnecessary for us to say anything of LONGFELLOW, for who is not familiar with his works? This edition is an honor to its publishers, and how they are able to make and sell a book exhibiting such careful preparation, excellent typography, beautiful illustrations and mass of matter for a dollar, is to us a mystery. But they have done it in this instance and promise to do likewise with other writers, so that we must wish them success.

Sabbath Reading.

"IN REMEMBRANCE OF ME."

So long as rain and sunshine fall,
The blossom shall not fail
Which friendship seeks when friends must part,
To give with her farewell;
And long as any breath of spring
Within our hearts shall stir,
We shall not ask, How fair? how sweet?
But only say, From her.

To-day I found some withered leaves,
Once fragrant, fresh and fair,
I held them tenderly and smiled
At what was pictured there,—
Smiled happily, and looked away
Behind the bygone years,
And saw the waves upon the sand,
And heard the boatmen's cheers.

And saw the blue sky overhead
With white-sailed clouds bedight,
And wore them on my breast again
And said again, "Good-night."
"Good-night;" and then I folded them
With precious things away.
To me they are not withered leaves
But sweet-souled words to-day.

"Good-night," and with my treasure safe
My tryst with God I keep,
And read his word, and pray, before
I lay me down to sleep,
Dear Christ, forgive the wayward feet,
And stay the failing hands,
And guide to pastures fresh and sweet
Thy little straying bands.

Still in the wine we drink thy blood,
And eat the broken bread;
And still our sacred vows renew
With bowed and reverent head.
Still may we hold thy gift of peace,
And, sweet as morning light,
Hear once again the tender tones
That gave our souls good-night.

[*Addie L. Wyman.*

FAITHFUL MEETS SHAME.

Christian.—Met you with nothing else in that valley?

Faithful.—Yes, I met with Shame; but of all the men that I met with on my pilgrimage, he, I think bears the wrong name. The other would be said nay, after a little argumentation, and somewhat else; but this bald-faced Shame would never have done.

Chr.—Why, what did he say to you?

Faith.—What? why he objected against religion itself. He said it was a pitiful, low, sneaking business for a man to mind religion. He said that a tender conscience was an unmanly thing; and that for a man to watch over his words and ways, so as to tie up himself from that hectoring liberty that the brave spirits of the times accustom themselves unto, would make him the ridicule of the times. He objected, also, that but few of the mighty, rich or wise were of my opinion; nor any of them neither, before they were persuaded to be fools and to be of a voluntary foolishness to venture the loss of all for nobody else knows what. He, moreover, objected to the base and low estate and condition of those that were chiefly the pilgrims of the times in which they lived; also their ignorance and want of understanding in all natural science. Yea, he did hold me to it at that rate also about a great many more things than here I relate; as that it was a shame to sit whining and mourning under a sermon, and a shame to come sighing and groaning home; that it was a shame to ask my neighbor forgiveness for my petty faults, or to make restitution where I have taken from any. He said, also, that religion made a man grow strange to the great, because of a few vices (which he called by finer names), and made him own and respect the base, because of the same religious fraternity: and is not this, said he, a shame?

Chr.—And what did you say to him?

Faith.—Say? I could not tell what to say at first. Yea, he put me so to it, that my blood came up in my face; even this Shame fetched it up, and had almost beat me quite off. But at last I began to consider, that that which is highly esteemed among men is had in abomination with God (Luke 16: 15). And I thought again, this Shame tells me what men are; but he tells nothing what God, or the word of God, is. And I thought, moreover, that at the day of doom we shall not be doomed to death or life, according to the hectoring spirits of the world, but according to the wisdom and law of the highest. Therefore, thought I, what God says is best, is best, though all the men in the world are against it. Seeing, then, that God prefers his religion; seeing God prefers a tender conscience; seeing they that make themselves fools for the kingdom of heaven are wisest, and that the poor man that loveth Christ is richer than the greatest man in the world that hates him; Shame, depart, thou art an enemy to my salvation.—*Bunyan's Pilgrim's Progress.*

CONSCIENCE is the voice of the soul, the passions are the voice of the body. It is astonishing that these two languages contradict each other, and then to which must we listen? Too often reason deceives us; we have only too much acquired the right of refusing to listen to it; conscience never deceives us; it is the true guide of man: it is to man what instinct is to the body, which follows it, obeys nature and never is afraid of going astray. —*Rousseau.*

Too many only see Christ in a book, as we see places in a map: but to come right—to enjoy him—this is delightful and saving.—*Rutherford.*

Ladies' Portfolio.

HOME.

THERE is a land of every land the pride,
Beloved by heaven o'er all the world beside;
Where brighter suns dispense serener light,
And milder moons emparadise the night;
A land of beauty, virtue, valor, truth,
Time-tutored age and love-exalted youth.

The wandering mariner, whose eye explores
The wealthiest isles, the most enchanting shores,
Views not a realm so bountiful and fair,
Nor breathes the spirit of a purer air;
In every clime the magnet of his soul,
Touched by remembrance, trembles to that pole;
For in this land of heaven's peculiar grace,
The heritage of nature's noblest race,
There is a spot of earth supremely blest,
A dearer, sweeter spot than all the rest,
Where man, creation's tyrant, casts aside
His sword and scepter, pageantry and pride,
While in his softened looks benignly blend
The sire, the son, the husband, brother, friend.

Here woman reigns, the mother, daughter, wife,
Strew, with fresh flowers, the narrow way of life!
In the clear heaven of her delightful eye
An angel guard of loves and graces lie;
Around her knees domestic duties meet,
And fireside pleasures gambol at her feet

Where shall that land, that spot of earth be found?
Art thou a man?—a patriot?—look around;
Oh! thou shalt find, howe'er thy footsteps roam,
That land *thy* country, and that spot *thy* home!

[*James Montgomery.*

HE WAS RICH.

A FEW weeks since a pleasure yacht was capsized in New York harbor and five of the persons on board were drowned, Mr. GARNER, the owner of the yacht, and his wife being among the number. This accident was in itself no more appalling than hundreds of others which are duly chronicled in the press from week to week, still within a few hours after its occurrence our city papers were filled with staring head lines, such as "HEART-RENDING CALAMITY—*Terrible Accident in New York Harbor*," etc., etc., followed by a brief account of how it occurred and a long eulogistic personal history of Mr. GARNER, ending by informing the public that he *was rich*. The illustrated papers posted off their artists to obtain portraits of the gentleman named and his wife, which duly appeared in their columns, they not forgetting to inform their readers that the deceased *were rich*. Even the very waters which rolled over the sunken yacht and its precious burden, and the dozens of small craft filled with idlers listless hovering about, were duly sketched for the delectation of the people. For a week or more following the disaster column after column of our daily papers were filled with accounts of it, not the smallest scrap pertaining to Mr. GARNER'S wealth being omitted.

In the search for the good deeds of the deceased it was discovered that he paid the men who catered to his personal comforts and pleasures "liberally"—a glorious thing to do, and judging from the comments of the daily press of this city, one might suppose it was the first instance on record of a man spending money freely to gratify his own personal pleasure. But in addition to the hundreds of columns filled with eulogium of this rich sportsman and the manner in which he met his death, nearly every church in New York and Brooklyn bowed to Mammon, and their pastors feelingly referred to his loss—and all because he *was rich*.

Scarcely a day passes in which some worthy person does not meet death in fully as tragic a manner as did Mr. GARNER, but a line—a paragraph at most—is all that the press bestows to their memory or good deeds in life, unless they happen to be wealthy; if so, the eulogium is drawn out to correspond with the length of the purse of the deceased!

Of course we have nothing to say in regard to the virtues of those who lost their lives in the ill-fated yacht, never having heard of them before their death, and for aught we know they may have been the very "salt of the earth," but neither vices nor virtues were named in the vivid accounts given of the catastrophe in the press of our city, but the burden of it was, bonds, stocks, landed property and great wealth—all of which seemed to stimulate the facile pens chronicling the sad event. Neither would we undervalue wealth or the talents a man must possess to accumulate and keep a store of this world's goods, in order to provide for his own wants and those depending upon him for support; but this long-continued laudation and bowing down to Mammon, as in the case under consideration, is, to say the least, disgusting, and unbecoming a people who claim to appreciate and exalt personal integrity and individual worth above gold.

What a lesson to our young men and women. Does it not say to them, as plain as words and actions can say, seek and obtain wealth above all things else! Get money, and your name and fame shall be heralded throughout the length and breadth of the land, and when death comes you will be remembered in prayers offered up from a thousand pulpits.

Is it any wonder, under such a condition of society, that men become corrupt and women stoop to intrigue and infamy to obtain that which possesses the power to silence calumny and open the gates of praise? CRITIC.

A MAN who takes a wife for the sake of her money rears ill-behaved children.

SUNDAY FLIRTATION.

IN a certain sense all attractive females are flirts. True, there are women about as good looking as the rough side of a horseradish grater, who read with glasses and eat with porcelain teeth, and yet flirt. There is an excuse for them. They are obliged to snap at the first chance like hungry wolves. But girls who don't have to jump at chances flirt because it is pretty business. True, it is pretty, and it is right. That is the only way she is to find out what her beau, possibly her future husband, is like. A man always approaches a girl dressed in society politeness, and it is the girl's duty to pierce this thin coating of sugar and plum, and learn what is beneath. She cannot accomplish this without flirting. Sunday is a blessed day for this semi-religious work. It is like an after-dinner hour. The men are gallant, the ladies melted out from the weekly stiffness, impulses are a-top, the key of the conversation delightful soprano, and the old people are snoozingly satisfied in the cool back room, or lazily content in church. In the evening the moon gives light enough to see the palpable shafts of a woman's glance when her head is bent forward. A woman's face never looks well by moonlight with the chin salient, unless it is when the young man has a few of his fingers engaged in supporting it. When the head is bent downward the girl can look out of the tops of her eyes. A man at all interested will wither like a cabbage leaf in August before the glance of a woman shot from the tips of her eyes. Again on Sunday the heart appears peculiarly soft and tender. There is a pathetic sadness in the associations which the heart takes. And this is in the woman's favor. She should lean away from levity. No man ever made any progress in loving while a woman was laughing. Nothing will sink into his soul like that subdued contidingness of tone on sad topics. A man may be worldly, but of all things he dislikes it is worldliness in a young girl. If you have any piety crowd it up on Sunday evenings. Better brush up on it in the morning.

FOR AND ABOUT WOMEN.

AN old man in a house is a terror; an old woman is a pearl.

HE who marries a woman congenial to himself is loved by the Almighty.

HE who has no wife lives without comfort, without help, without joy, and without blessing.

WHEN a man loseth his wife, the world around him groweth dark, the light in his tent is dim, and the light before him is extinguished.

To write a good love letter you ought to begin without knowing what you mean to say, and finish without knowing what you have written.—*Rousseau.*

Two ladies contended for the precedence at the court of Charles V. They appealed to the monarch, who, like Solomon, awarded, "Let the elder go first." Such a dispute was never known afterward.

A YOUNG lady of Georgia is six feet two and a-half inches high, and when her young man sings, "Thou art so near and yet so far," he can throw more feeling into the song than any other man in the State.

WOMAN AS A CRIMINAL.—French statistics show that woman is six times less criminal against person, four times less criminal against property, and twice less hardened a criminal than man. The record (recently published) also proves that maternity is a better shield against bad life than paternity. Of 1,000 female criminals 261 are mothers, and of 1,000 male criminals 324 are fathers.

MARY MAPES DODGE, in her new book "Theophilus and Others," has the following model preface:

"These tales and talks, most of which have appeared in various periodicals, are now at the urgent solicitation of friends, etc., etc., etc.

"Their preparation has enlivened hours of, etc., etc., etc.

"If this little volume shall, etc., etc., etc.

"In conclusion the author begs, etc. etc., etc. "M. M. D."

A BROOKLYN girl having been visited for some months by an exceedingly bashful gentleman brought on the wished-for climax by the following ruse. He made an afternoon call and after a few minutes waiting she rushed into the parlor equipped for the street and said hastily, "I am in a great hurry—have an engagement with a lady friend, and if you came for the purpose of proposing marriage you must be quick about it." Wedding early in the fall.

THE literary women of England have entered a protest against the apartment allotted to them in the British Museum. The approaches to it are narrow and unsightly, in marked contrast to the broad passages and stairways leading to the other departments. The room itself is dingy, dimly lighted and in uncleanly order. The ladies maintain that the museum belongs to the nation and that they have a right to as comfortable and elegant a reading-room as that accorded men. They announce, too, that they intend to prosecute the affair until they get justice.

REFERRING to the closing of the first year of instruction at the Smith Woman's College in Northampton, Mass., the Springfield Republican says: "Ten months of experiment have shown that women students are as capable of advanced study as are men, and it is the college's proud record that all of the students who have boarded on the institution grounds, go to their homes in as good health as when they came, and that some are much better. There has been but one case of sickness among them, and that was really contracted before the pupil entered.

Reading for the Young.

NATHAN NOBB,
Oh, what a job!
Always walked on his head;
His mother would sob
To his brother Bob,
And his father took to his bed.

They made him a boot
His head to suit,
But a horrible thing must be said,—
His hair took root,
And began to shoot,
One day, in the garden bed!

So there he stands
With the help of his hands
And a little support from his nose:
The gardener man,
With the watering-can,
Says, "Gracious, how fast he grows!"

LETTERS FROM BOYS AND GIRLS.

From a West Va. Genius.

GOOD MORNING, COUSINS:—"Why—where did you come from?" I hear some of you exclaim. I will tell you. I live in West Virginia, in a small village on the banks of the West Fork River. My father is proprietor of a large flouring mill. I am going to school, and, like YOUNG ARTIST, "am still young enough to attend common school." About making quilts: Girls, I will give you my opinion, and not charge you one cent. I think there is not the least use of it—cutting up calico just for the pleasure of sewing it together again. Why not spend your time at something better? Let YOUNG ARTIST tell the girls that plan she has for spending time better than making quilts. We have an organ, and I have been taking lessons. I am having a nice pleasure boat built, and I want some of my Cousins to give me a name for it—a real nice one. What shall it be? YOUNG ARTIST, in her letter, says, "We may not be as conceited as our boy-cousins," &c. As if we boys are conceited! The idea is preposterous! And let none of our Cousins again speak of "noble manhood" in such "degrading" terms. Boys! boys! awake! Don't you see the girls are "half crazy" to hear from you? Come out and say what you want to; and don't be "backward." We *can* and *must* "hold our own" with the girls. Let us have a "lively campaign" this summer. YOUNG BACH, how can you sit there, and let the girls say what they please about you, without saying a word? Stand up and let them know what you are made of. Show them that you are not afraid. They need not think they can "preach decorum" to us; if they do try, we will make a noise and not listen to them. I think I shall attend the Centennial, and perhaps you will hear from me. Well, I must draw my letter to a close, for I fear it will be too lengthly. Let me hear from all of you soon, and perhaps you will again hear from—YOUNG EDITOR.

P. S.—My reason for signing my name Y. E. is, that I print a small amateur paper. I will send YOUNG ARTIST a copy of my paper, provided she will send me one of her works of art, which, if I receive, I will highly extol in my paper.

From an Iowa Girl.

DEAR COUSINS:—It is a long time since I wrote to you, but I have not much time for writing as I go to school and have to study very hard. I promised to describe the place in which I live; but before I do so I wish to say, in answer to CRITIC, that the reason girls bestow their smiles and favors on "tobacco distillers" is, they can find nothing better. But I intend to wait for something better, if I have to wait a lifetime. I always said I never would go with a beer keg stopped with a cigar, or lock arms with a whisky jug corked with a plug of tobacco. The printer made me live in Iowa City instead of Tama City, which is my home. Now this is not a city, but an incorporated town of about 1,500 inhabitants, situated on the north side of the Iowa River, on the C. & N. W. R. R., 170 miles west of the Mississippi River. About three and a-half miles west of the town is a large dam, which turns the water into a canal or race which carries it into a reservoir covering about forty acres. This reservoir is situated southwest of the town, and on its banks, and run by the water which it contains, are a foundry, machine shop, tub factory, flouring mill, carpenter's shop and pump shop. These have all been built within the past year. In the eastern part of the town is our large school house, which cost about $16,000. We have an excellent school of six departments, with a principal and six assistants. I attend the higher department. We have many nice buildings for so small a town. There are two banks—the National and the Bank of Tama. The latter has a marble front. In the north part of the town are two very nice buildings—finer than are generally found in towns of this size. They are large brick dwellings, costing about $16,000 each. But I am making a short story long, so I must close. SCHOOL GIRL, *Tama City, Iowa.*

A Query.

DEAR EDITOR:—I like to read your valuable paper, especially the puzzles and letters from boys and girls. I did not chance to see TOM'S letter, but from what I can make out from the replies, he gave the girls a blowing up about fashions. I think girls pay more attention to fashions than boys do. But I know that any person can get along as well without fashions as with them. If I dress neat, and clean and suit my own taste, I care but little for latest fashions or style, or people that admire them. I am lame, and cannot work much on the farm. Can any of our Cousins tell me which are the best kinds of ducks to raise, and what is the meaning of deboitement?—WALTER P., *Ills.*

From a Connecticut Girl.

DEAR EDITOR:—We take six papers, but we all like the RURAL and think it the best of any. I go to school this summer; we have a lady teacher, and I like her very much. I study Arithmetic, Geography, Reading, spelling and Writing. I have a diary and write in it every night. I am eleven years old. I have two brothers and two sisters older than myself. I have a little nephew six months old; he is very cunning. My father is a farmer. We have four little calves and a good many little lambs. I have a tame sheep.—EMMA V. B., *Newtown, Ct.*

A New Recruit.

MR. EDITOR:—I have been reading the letters from the girls and boys, and am going to try my hand at it. I am sixteen, and live on a farm. I would tell R. E. M. that I have been to one leap-year party, and expect to go to another next week. It is real fun. I have no pets but have a very nice piano, and am fond of music. There are a great many young folks here, and during winter we have grand times. Please accept me as a cousin. LENA B. C.

From a "Blue Grass" Boy.

MR. EDITOR:—I have been thinking for a long time of writing a letter to the RURAL, but have not attempted until now, and I hope you will print my first letter. My father has taken the RURAL for about twelve years, and he says he cannot do without it. I live in the country, four miles from Carlisle. I enjoy reading the Story Teller and the Boys' and Girls' Columns very much.—R. H., *Carlisle, Ky.*

From Ohio.

DEAR EDITOR:—Pa has taken your paper two years; we missed it one year, but find we cannot get along without it. I live on a farm in Ohio and go to school. I have a little mute sister. We intend to send her to school in the fall.—YEKIE.

The Puzzler.

GEOGRAPHICAL ENIGMA.

I AM composed of 61 letters:

My 5, 11, 15, 38, 30, 18, 31, 9, 26, 40 a town of Connecticut.

My 37, 1, 2, 23, 22, 8, 44, 18, 19, 32, 3 a town of Quebec.

My 53, 28, 6, 13, 21, 4, 23 a town of New Hampshire.

My 20, 12, 23, 49, 35, 10, 33, 48 a city of Massachusetts.

My 51, 29, 55, 7, 45, 57, 52, 36, 38, 20 a mountain peak of Vermont.

My 14, 59, 17, 47, 24, 29 a city of New Hampshire.

My 41, 42, 43 a city of Burmah.

My 16, 61, 33, 44, 12, 66, 50, 58 one of the Fiji Islands.

My 60, 61, 51, 19, 26, 25, 61, 54 a river of Australia.

My 37, 16, 40, 11, 27, 34 a city of Abyssinia.

My whole is a text showing the importance of prayer.

☞ Answer in two weeks. LITTLE ONE.

NUMERICAL ENIGMA.

I AM composes of twenty-five letters:

My 3, 22, 7, 20, 14 a small fruit.
My 5, 15, 19, 11, 24 an aromatic plant.
My 7, 9, 18, 8, 1 a blacksmith's tool.
My 14, 12, 6, 1, 16 a rapacious bird.
My 18, 24, 9, 21, 10 a planet.
My 20, 17, 22, 2, 23 a European city.
My 25, 4, 12, 22, 13 a voracious fish.

My whole is a proverb.

☞ Answer in two weeks. ISOLA.

PUZZLER ANSWERS.—July 29.

ILLUSTRATED REBUS.—

Some err in that, but numbers err in this,
Ten censure wrong for one who writes amiss.

HIDDEN TREES.—1, Laburnum; 2, Laurel; 3, Larch; 4, Palm; 5, Willow; 6, Palmetto; 7, Yew; 8, Camphor; 9, Beech; 10, Cedar; 11, Aspen; 12, Chestnut; 13, Orange; 14, Upas; 15, Spruce.

SYNCOPATIONS.—1 Crow—cow; 2, Meat—mat; 3, Cart—cat; 4, Dime—die; 5, Pain—pan; 6, Boat—bat; 7, Load—lad; 8, Bread—bead; 9, Clock—cock; 10, Coat—cot.

MISCELLANEOUS ENIGMA.—Lord Macaulay.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters he aim will not be to make them so scientific that hey may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

THE cotton worm has appeared unusually early in Mississippi.

Kansas expects to make $20,000 worth of silk this year.

New gold mines have recently been discovered on Beaver Creek, fourteen miles west of La Grande, Oregon, and between that point and Senator Jones' celebrated Camp Carson gravel mine.

Galveston, Texas, is now shipping wheat direct to Liverpool at 20c. per bushel.

In England, theatres are being converted into skating rinks, while on this side of the Atlantic the reverse is the case, the large rink at Newark, N. J., being now in the course of transformation from its present condition to that of a first-class theater.

Mr. John Bell of England has written a pamphlet proving the United States of America to be the Messianic World Kingdom. It is painful to reflect, in this connection, that the Messianic World Kingdom is the seat of the whisky ring.

A band of Cuban insurgents captured a convoy with $60,000 in gold, recently, near Villa Clara.

Tramps are said to be becoming so numerous along the Central Pacific Road in Nevada that conductors and brakemen are scarcely a match for them. It is feared that if they continue to go in gangs, armed guards will have to be sent with the trains to protect passengers.

Governors Tilden and Hendricks have published their letters of acceptance.

D. F. Welling, the editor and publisher of the Warwick Advertiser and the Orange County Crusader, Chairman of the Prohibition State Committee and a prominent temperance reformer, has been missing since Saturday. His financial affairs are in a bad state, and the office was to be sold last Saturday under a mortgage. He assigned some book accounts to secure indorsements.

Colorado is now a State, making the thirty-eighth in the list.

There is now no obstacle to an early adjournment of Congress. If the session, however, should be prolonged, the fair inference would be that the honorable members are afraid to go home. Some of them have been out rather late.

In Canada the hay and oat crops are very large, but wheat has suffered severely, owing to the great heat. There are fair crops of peas and Indian corn, but fruits are less abundant. The general result appears to be satisfactory, and will stimulate Canadian trade.

The Senate of the United States has recorded its decision in the impeachment trial of ex-Secretary Belknap. On the first article the vote stood 35 for conviction, 25 for the discharge of the accused for lack of jurisdiction. On other articles the vote stood 36 and 37 to 25 and 26. The negative votes were explained by those who cast them with two exceptions. It was stated in nearly every instance that the negative decision was based, not on the question of guilt, but on that of jurisdiction exclusively. Senator Jones of Florida refused to vote.

A detail of fifty more convicts from Auburn has been made to the Elmira Reformatory. This leaves the population of the prison at 1,365. Forty-one men were discharged in July, and forty-nine go out this month. Sixty-six men were received during the last month.

Fifteen Chinamen went up in a waterspout in Nevada last week. They were in a tent on a hillside near Eureka when the water broke upon them. Six were swept down the canon, and their bodies have not been found. One was carried two miles, but still lives.

The Centennial buildings were well constructed after all. They were subjected to a severe test by the recent storm, but there were few leaks. The sieve-like roof of the Art Annex let in water, and the Japanese silkworms, the Italian confections, and the Canadian birds were slightly injured, but the damage in the Main Building, Machinery Hall, Memorial Hall and the other structures was trifling.

There are 40 cotton mills in Georgia, and they have been in active operation during a very dull season. Tennessee has taken great strides in manufacturing, and throughout the South the drift of capital is toward industrial pursuits. The farmers, too, have not only adapted themselves to free labor, but have also planted new crops, adopted wiser methods of cultivation, introduced improved agricultural implements, and begun to sow grasses and raise stock. The South is learning manufacturing, stock-raising, and scientific farming in the hardest of hard times, and scarcely knows whether it is going backward or forward.

The report of the committee from the U. S. Senate, which investigated the affairs of Mississippi, will be made soon.

On the return trip from Deadwood, Wyoming Territory, on Aug. 6, the stage was attacked by Indians at Indian Creek. The stock was stolen, the mail bags cut open, the coach destroyed, and one passenger wounded. A camp of 15 Indians was surprised and attacked at Old Bridge Ferry, forty miles north of Fort Laramie, by a party of herders.

The Athens depot, N. Y., has again been burned.

The latest number of the American Journal of Science and Art contains a highly interesting paper on Dinitroparadibrombenzols and their derivatives, on Menonitroparadibrombenzols, on Alphadinitroparadibrombenzol, and on Natriumhydrate solution's action on the Alphadinitroparadibrombenzol, producing as it does a Nitrobromphenol. In the experiments which led to the adoption of these Aristophanesian words "a violent action set in, during which it was found advisable to remove the burners." We are not surprised.

A further importation of improved live stock is to be made into New-Brunswick at the expense of the Province.

The (Chicago) Evening Telegraph, Mr. Storey's evening paper, which started eight weeks ago, has published its last issue.

The Cheyenne Sioux request of the Government a cessation of hostilities against Sitting Bull with a hope of effecting a peace with him.

The House has passed a bill repealing the Resumption act of 1875 by a vote of 106 to 86; another bill was passed providing for a commission to consider the question of a double standard of value and the practicability of resumption.

Commodore Vanderbilt's condition improved, and his physicians and friends think he may possibly live for weeks.

Mr. Mullet has now 31 Republicans and 2 Democratic Senators on his petition for reinstatement as Supervising Architect of the Treasury. The President is known to be very friendly to him, but it is understood he has said he would not interfere with Secretary Morrill in filling that important office.

The President has signed the joint resolution prohibiting the supply of special metallic cartridges to hostile Indians; also, the act to further authorize the Commissioners of Indian Affairs to purchase supplies for the Indian Bureau in open market; also the joint resolution providing for the restoration of the original Declaration of Independence.

A Boston correspondent of a New York paper gives an interesting account of the anniversary meeting of the Society to Encourage Study. It is doing an excellent work in stimulating study among young women who have ended their school days but not their desire for learning. The high class of studies that have been pursued in many instances by members of the society is especially noteworthy. Might not a similar organization do good service among young men, especially with clerks in mercantile business, whose tendency is to drop all studies and lose the bulk of the knowledge they have acquired at school?

Sultan Murad's condition is pitiable indeed, if accounts from Constantinople are true. A correspondent of the *Messager du Midi* sends to that paper a letter purporting to have been written by the Sultan's physician, which says that "Murad is dying from delirium tremens, brought on by hard drinking, principally absinthe, reckless debauchery, remorse for his uncle's death, and dread of a Russian invasion, or attacks on his palace by Mussulman fanatics."

The receipts for a year's license fees from gamblers in Virginia City were $29,000. The money is collected monthly, and gambling is in no way restricted.

A circus wagon containing sea lions was backed into Lake Winnebago, Wis., to give the animals water, when suddenly the doors flew open and the lions escaped. As one of them has by this time a litter of young ones, it is likely that a colony of the animals will grow up in the lake.

The skull race for the championship of Halifax Harbor in which the competitors were Warren Smith and Obed Smith of the Fishermen's crew, and John Brown, was won by Warren Smith, making the distance, three miles, in 23 minutes.

The Dominion Government has refused to commute the sentence of O'Neil, the New Brunswick murderer. He will therefore be hanged on Thursday next.

Bruce Younger, a cousin of the notorious Younger brothers, has been arrested on suspicion of being one of the gang who robbed a railroad train near Otterville, Mo.

A tornado passed over Rhomere Township, Cass County, Missouri, destroying several dwellings and seriously injuring the crops and farm produce. Two people were killed.

Chief Justice Monell, of the Superior Court of New York, is dead. He was a good jurist, and highly esteemed on personal grounds.

The second day of the Maine State camp meeting at Sebago Lake opened with an increase in numbers and enthusiasm. The forenoon was devoted to reports of the reform work in the different parts of Maine and New England. Owen B. Chadbourn of Saco, J. K. Osgood, E. W. Stetson and others gave very interesting accounts of the great work being done.

Mrs. P. W. Prescott's large Westborough barn and contents were burned by a tramp. Insured for $2,100. The Reform School boys did good service at the fire.

The power of mineral water is demonstrated by the new springs at Saratoga, the Diamond and the Magnolia, the latter near the High Rock. A nail dipped in the water will pick up needles. At a recent trial by a young man he picked up and drew away, not only a needle, but the young lady to whom it was attached. Since then young ladies pronounce this spring superior to the old cathartic waters.

Two bales of cotton were received at Savannah last week, one of Georgia and the other of Florida growth. The Georgia bale was sold at 15 cents per pound, while that from Florida brought 15 1-6 cents.

Competition for the selection of a Canadian rifle team to compete at Creedmoor is in progress. The members of the Austrian team to take part at Creedmoor will participate in the matches of the Ontario Rifle Association, which commences at Toronto on the 29th.

A new relic of Washington! A lady in Newburgh has in her possession a piece of the tablecloth the Father of his Country ate on at Morristown. She gives this account of it in the Newburgh Journal:—"Gen. Washington gave it to the washerwoman, and by accident it got scorched. When she returned it to him there was a young lady present by the name of Eunice Lindsly, and he gave it to her. And when she married she made a wedding skirt of it. It was the fashion in those days to wear skirts and shortgowns. One of Gen. Washington's generals gave the same lady her wedding ring. She lived and died in Westtown, in the town of Minisink. Mr. Edmund Cocks's wife was a granddaughter of the lady spoken of. She gave the piece to me. She was formerly of Newburgh, but now of New York."

The Washington correspondent of the Boston Herald furnishes this interesting news:—"The proposition to give President Grant a pension for life has become a subject for discussion among Congressmen, and it looks as if an effort to that end might be made next winter. Members of the House are talking the matter over."

Col. Sellers to the front! Great gold discoveries in Vermont.

There are 12,000 men and boys in San Francisco looking for work. If the surplus capital that is now locked up in railroad and mining stocks were used to bolster up manufacturing, the unemployed might earn a living.

The early settlers at Saratoga mixed biscuits with Congress water, using neither cream of tartar nor saleratus, so great was its effervescing quality at that time. The pillars of Old Union Hall at Saratoga were overgrown with tomato vines—then considered poisonous, and called "love apples." Boys and girls, on their way from school would stop there and throw the red apples at one another.

J. S. Poland, Captain of the 6th Infantry, writes from Headquarters, Military Station, Standing Rock, D. T., under date of July 24, to the Adjutant-General, Department of Minnesota, giving an Indian account of the battle of the Little Big Horn on June 25. The account does not differ essentially from the reports already published. It says, however, that Sitting Bull was neither killed nor personally engaged in the fight. He remained in the council tent directing operations. Crazy Horse, with a large band, and Black Moon, were the principal leaders on the 55th of June. Kill Eagle, a chief of the Blackfeet, at the head of some 20 lodges, was at this agency about the last of May. He was prominently engaged in the battle of June 25, and afterward upbraided Sitting Bull for not taking an active personal part in the engagement. Kill Eagle has sent word that he was forced into the fight, and that he desires to return to the agency, and that he will return to the agency if he is killed for it. The report concludes as follows:

"There is a general gathering in the hostile camp from each of the agencies on the Missouri River, Red Cloud's and Spotted Tail's, as also the Northern Cheyennes and Arrapahoes. They report, for the special benefit of their relatives, that in the three fights they had with the whites they have captured over 400 stand of arms, carbines rifles, and revolvers not counted; ammunition without end; and some sugar, coffee, bacon and hard bread. They claim to have captured from the whites this summer over 200 horses and mules. I suppose this includes operations against the soldiers, the Crow Indians and the Black Hills miners. The general outline of this Indian report concurs with the published reports. The first attack of Reno's began well on in the day. The Indians report about 300 whites killed, and do not say how many Indians were killed."

A report from another source says the Indians obtained from Custer's command 392 carbines and revolvers. I have, since writing the above, heard the following from returned hostiles: They communicated as a secret to their particular friends here information that a large party of Sioux and Cheyennes were to leave Rosebud Mountains, a hostile camp, for this agency, to intimidate and compel the Indians here to join Sitting Bull. If they refuse, they are ordered to "soldier" them, beat them, and steal their ponies.

FOREIGN NOTES.

THE new French postage stamps are now in circulation. They represent Commerce with the caduceus and Peace with an olive branch joining hands over a terrestrial globe, upon which is put a number indicating the value of the stamp.

The zither is fast coming into fashion in London drawing rooms, and, it is said, threatens the exclusion of other now popular instruments.

The proprietors of the Paris newspapers which were fined for libel on the Jesuit College have appealed from the judgment of the court.

Queen Isabella has informed King Alfonso that she has decided to take no part whatever in the political affairs of the Kingdom.

TORONTO, Aug. 1.—The fourth annual meeting of the Canadian Labor Congress was opened here this afternoon. A large number of delegates are present. A motion was carried advocating universal suffrage.

TORONTO, Aug. 1.—The Globe to-day publishes the second series of crop reports from all parts of Ontario, Quebec, New Brunswick and Nova Scotia. The reports show that the sanguine anticipations indulged in a month ago have not in some respects been realized. The hay crop is enormous and the quality excellent. The root crop gives good promise; the instances where it is not reported as doing well are few. The too stimulating effects of the weather have been prejudicial to barley, the berry in many places being thin and light, and the crop is expected to turn out an inferior one. But this state of things is by no means universal, and in many instances the appearance of the barley, now rapidly ripening, is said to be most satisfactory. On the whole, the barley crop may not be very much, if at all, below the average.

In proportion to the area planted of oats, the crop will be a very heavy one. The storms have in many sections done some injury to struggling grain, and here and there the frost is said to have affected the oats, but the yield will be, both as to quality and quantity, above the average. Indian corn, where early planted, and in fairly favorable situations, is looking well, and will be a good crop. Potatoes are promising well, and will yield apparently an abundant return. Colorado beetles do not seem to be much less numerous than formerly, but the means taken to insure their destruction, and the extraordinary growth of the plant, have greatly frustrated their ravages. Peas have been injured by storms, and the season generally of late has not been very favorable to their development, but the crop will probably turn out on the whole a fair one. The crop of flax, so far as it is cultivated, is also reported on favorably. Of fruits the crop will be small. There seems to be literally no plums, and peaches will be scarce. Cherries have been more abundant, but small fruits, both field and garden, have been much injured by rains. The intense heat of the weather, accompanied by rains and a close, humid atmosphere, have during the past month done immense damage to wheat.

The negro Cooba, one of the most prominent Cuban insurgent leaders, has been killed in ambush near Sagua.

The Montenegrins are armed with the Kraka rifle.

Sultan Murad had at one time the reputation of being a hard drinker.

The Softas in the Turkish service carry a green bag having a long Arabic inscription in red letters.

The Red Republicans control the Roumanian Chamber of Deputies, and are of course friendly to Servia.

Great Britain has about 50,000,000 Mohammedans in her East India Empire. Her Christian subjects there do not number quite 900,000.

Selim Pasha, killed at the battle of Urbiza, had been nearly a year engaged in war against the Herzegovinians.

The Circassians, who are in part responsible for the Bulgarian atrocities, migrated into Turkey between 1860 and 1864 to the number of 150,000.

A dispatch from Ragusa says that Mukhtar Pasha, with the remainder of his army, variously estimated at from six to nine battalions, had arrived at Trebigne, having evacuated Bilek immediately after the battle of Urbiza. The Ottoman authorities admit their defeat in that battle, and also the following losses:—Selim Pasha, killed, and Osman Pasha, taken prisoner, together with two colonels, three lieutenant-colonels and seven majors. Two battalions of infantry and one of chasseurs were destroyed to the last man, and all the other battalions suffered more or less. The Turkish loss was between 5,000 and 6,000. The number of Turkish inferior officers killed is enormous. The pursuit was continue to the walls of Bilek. Corpses were lying thickly in the road be-

fore the citadel. Besides the artillery and trains, the Montenegrins captured 400 horses and an immense number of arms. The Turks were greatly outnumbered.

The Montenegrins are besieging Trebigne.

The Servians defeated an Egyptian division.

After five days' fighting the Servians have abandoned Gurgusovatz.

A new Ministry has been formed in Roumania.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 29, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	58,125	Molasses	—
Whisky	2,841	Rice, bbls	317
Corn meal, bbls	3,335	Cut meats, pkgs	6,174
Corn meal, bags	1,223	Lard, pkgs	5,561
Wheat, bush	259,251	Tobacco, hhds	3,217
Corn, bush	149,361	do. cases	5,373
Oats, bush	207,900	Butter, pkgs	25,084
Rye, bush	1,025	Cheese, bxs	105,329
Malt, bush	62,026	Cotton, bales	5,065
Barley, bush	—	Rosin	18,122
Beans, bbls	5,832	Spts. turp., bbls	2,765
Grass seed, bush	6	Dried Fruits, pkgs	95
Beef, pkgs	458	Eggs, bbls	6,150
Wool, bales	3,971	Peanuts, bags	1,163
Hops, bales	519	Leather, sides	73,324
Pork, bbls	1,342	Sugar, hhds	—
Tallow	1,105	Oil cake	5,935

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 566 bbls.; since Jan. 1st, 32,373 do.; same time last year, 18,534 do. Exports of peas past week, 2,235 bu.; since Jan. 1st, 470,201 do.; same time last year, 228,947 do. The bean market has suddenly improved, and holders are generally quoting strong prices for sound or useful parcels of both mediums and marrows. The latter show the best advance, being now quoted at $1 50. Exporters are operating freely, and have secured most of the above quantity at $1 45, free on board. This has increased use for mediums since the weather cooled off, and the Eastern trade is forced to use some, owing to the scarcity of good beans. White kidneys have had some sale. Red kidneys have quite a steady, price-supporting demand. Canadian peas quiet. Green peas dull. No Southern it. E in market. We quote:

Beans—Prime pea, $1.20@1.25; fair to good, $1.00@1.10; prime mediums, $1.11@1.10; fair to good, 80@90c.; poor, 60@80c.; prime marrows, $1.45@1 50; fair to good, $1.25@1 35; prime white kid., $1.20@1.30; other, $1.00@1 10; prime red kidney, $1.40@1.45; other, $1.15@1.25; Lima (Cal.), $2.75@3. Black hawns, $2.75. Peas—Canadian, in bulk and bond, 97½—c.; green, $1.00@1.10, split, ₱ bbl., $6.

BUTTER.—There is still only a limited supply of fine table butter and sellers have no trouble in closing out all of the creamery and fine pails that arrive. Fine half tubs are also scarce. A good many lots are sent in as fine which have not that standard. Summer buyers however who are willing to pay full prices are very fastidious and sample very closely. After leaving good table grades there is little call for State, and many lots will have to be held for a time with losses on the July shipments. Of Western butter there are two selling grades the best and the poorest. Holders of Western have acted wisely this season in encouraging an export outlet. The market has been cleared of many lots that would have hung on indefinitely. The comparative table we annex shows the export to be about three times the quantity taken last year up to this date. For Europe in addition to the English demand some German buyers are operating.

Comparative receipts and exports from June 1st.

	Receipts, pkgs.	Exports, lbs.
June 1, '76, to Aug. 1, '76	205,785	1,115,926
June 1, '75, to Aug. 1, '75	154,903	414,750
June 1, '74, to Aug. 1, '74	175,749	1,179,389
June 1, '73 to Aug. 1, '73	186,707	635,207
June 1, '72 to Aug. 1, '72	123,068	813,032
June 1, '71, to Aug. 1, '71	119,111	1,163,757

We quote:—Choice pails, 28@30c.; prime, 25@26c.; poor to good, 19@23c.; creamery pails, choice, 28@30c.; good, 26@27c.; sweet cream pails, 22@27c. State firkins, choice, 26@27c; fair to good, 22@25c.; do. half firkin tubs, choice, 26@27c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 27@28c.; other, 18@21c.; Western creamery, choice, 25@27c.; other, 21@24c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 20@21c.; other, 13@15c.; factory choice, 16@17c.; other, 13@14c.

COTTON.—With reports from the South of apprehended more serious damage to the crop by worms, prices are higher and strong. Quoted 12 3-16@12 7-32c. for August; 11 15-16@11 31-32c. for September; 11¼@11 25-32c. for October; 11 21-32@11 11-16c. for November; 11 11-16@11 23-32c. for December; 11 27-32@11¾c. for January; 11 31-32@12c. for February; 12¼@12 5-32c. for March; 12 9-32@12 5-16 for April; 12 7-16@12 15-32c. for May; 12 19-32@12¾c. for June; for July, strong. August, ¼c; September, 5-32c.; October, 5-32c.; November, ¼@5-32c.; December, 5-32c.; January, 5-16c.; February, 5-32c.; March, ¼@5-32c.; April, 5-32c.; May, 5-32c.; June ¼c.; July, 5-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	8¼	8¼	8¾	8¾
Strict ordinary	9¼	9¼	9¾	9¾
Good ordinary	10	10	10¼	10¼
Strict good do	10⅝	10⅝	10⅞	10⅞
Low middling	10 1-16	10 3-16	11 5-16	11 5-16
Strict low middling	11¼	11¼	11⅜	11¾
Middling	12	12⅛	12 3-16	11 3-16
Good middling	12⅝	12⅝	12⅞	12¾
Strict good middling	13	13¼	13⅛	13¾
Middling fair	13⅜	13¾	13⅞	13⅜
Fair	14¼	11⅜	14¾	11¾

Stained.

Good ordinary	8 13-16	Low middling	10¼
Strict ordinary	9⅜	Middling	11⅛

CHEESE.—Early in the week there was quite a firm feeling generally and ¼c easily made on strictly fancy factories, with reports of some ordered lots up to 13c., but it soon became evident that pretty full supplies could be looked for through the week, and this led to indifference among exporters. When the heavy arrivals by Thursday's cheese trains came along, on top of the very fair receipts previously, the market became completely demoralized, and it was impossible to sell, unless at decided concessions; this was the case more with grades running on the choicest. The bulk of the business has been at 9@9¼c. for about fine and the ordinary run of fancy; on some special brands 9¾c. is held, but this rate is now extreme. Very good sold as low as 8½c. A larger quantity will be carried over than for some little time, and the feeling at the close is weak.

New 9¾@9¾c. for fine and fancy factory; 7½@8c. for good; 6½@7½c. for fair; do., half skimmed, 4½6c.; do., skimmed, 3@4c. State farm dairy, 8½@8¾c.; good to prime, 6@7c.; fair to good, 5¼@6¼c.; Western factory, good and prime, 6½@7½c.; fair lots, 6@7c.; do. cheddar, choice, 7¾@8c.; do. flat, choice, 8@8½c.

Comparative receipts and exports from June 1st:

	Rec'ts, pkgs.	Exp'ts, lbs.
June 1, '76 to Aug. 1, '76	659,613	30,138,462
June 1, '75 to Aug. 1, '75	777,823	31,775,618
June 1, '74 to Aug. 1, '74	685,985	35,177,251
June 1, '73 to Aug. 1, '73	711,220	30,873,020
June 1, '72 to Aug. 1, '72	570,164	25,535,224
June 1, '71 to Aug. 1, '71	424,604	22,126,133

DRIED FRUITS.—Small lots of new Southern apples are coming forward, but in poor order, with quartered at about 8½c. The inquiry is very light and the crop promises large. Peeled peaches are dull. Supplies are well controlled. Blackberries bring 7c. and are in light demand. We quote:

Apples—State, sliced, 8@8¾c.; do., quarters, 8@8¾c.; Southern sliced, 8@8½c. for prime; Blackberries, nominal. Peeled peaches, good and prime Georgia, 10@12c.; fancy, 13c.; unpeeled peaches, new, nominal for halves and for quarters. Plums at 12@13c. Raspberries, 24@25c. Cherries, 11c.

EGGS.—This usually readily-selling item in summer has an unsteady time this season. Just as soon as prices begin to show any real hardness buyers withdraw and light receipts become unmanageable when a new extreme is pressed for. For the moment prices are firmer than at our last, but much depends on prime quality for outside prices.

Near points, 20@22c., State and Penn., 20@20½c.; Western, prime, 18½@19c.; do. other, 17@18c.; Canadian, 18½@19c.

ESSENTIAL OILS.—The following are the latest revised quotations:

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras, 3oc.

FEATHERS.—Quiet. We quote prime live Western geese, 53@55c.; other do., 25@40c.

FLOUR.—There has been a good, liberal demand for exporters and the home trade, and prices are higher and buoyant. We quote:

For poor to very choice superfine State, $3.65@4.35; $1 50 4 60 for very common to fair extra No.; $4.55@4.75 for good extra do.; $4.80@5.35 for fancy do., and $5.30@6 50 for very choice extra; $3.65@4.35 for superfine Michigan Indiana, Iowa, &c.; $4.50@4.75 for shipping extra do., the inside price for inferior, and $4.85@5.35 for choice to very fancy extra do.; good to choice white wheat extras at $5.75@6.60; fancy do. $6.75@8.25; winter wheat, good to choice family city mill extras, $7.50@8.50, round-hoop Ohio, $4.55@4.95, and trade brands of do. at $5.00@5.85; St. Louis, $5.05@6.10 for common to fair extra, and $6.15@8.50 for good to very choice; Minnesota "straight" at $5.50@7.15, and patent at $6.50@9 00; unsound stock at from $3.50@5.75; city mill extra at $4.50@5.90; No. 2 at $2.40@3.35. Southern flour brings rather better prices, with, however, less doing. Sales 1,400 bbls. We quote as follows:—Common to good extra, $4.35@5; good to choice, $5.05@5.75; common to choice family extra, $5.80@8; choice to fancy new process, extra, $8.05@8.50, the latter an extreme.

FRESH FRUITS.—The fruit market indicates our entrance into the last month of summer by an abundant display of fruit of mature size and improved quality. Of apples there is now a good assortment of ripe, early sorts, and sales are more readily effected. Prices rule low, as they do not obtain much of a start until peaches have had their term. Peaches are daily running better, some of the desirable sorts begin to appear, among which are Troths. This season will be a profitable alternation for Delaware owners, and they indeed deserve one, after handling the immense and unremunerative crops of 1875. New Jersey orchards, also, will be helped by the light growth of the South. California pears and plums are counted upon for regular arrival, and sales are encouragingly active. The products of the Pacific nurseries have become ensconced in an undisputed niche in our pomological display; growers, shippers and consignees cannot be too highly commended for the evident pains they take to make the establishment a worthy one.

This branch of trade requires the attention and exertion of wealthy and enterprising merchants to develope it, and their efforts are certainly praiseworthy. Pears, after many experiments, can be landed here successfully; but plums and grapes have, to some extent, baffled the attempt to put them in market right, owing to their tender nature. But it seems that even these will have to succumb to determination and ingenuity. This season, one of our assiduous firms, Messrs. Davis and Sutton, has utilized the celebrated Allegretel Refrigerators with marked success, delivering this week 800 boxes of White Egg, Duane's Purple and other choice plums. Grapes will now have a thorough test in shipment. Watermelons unusually bad. Blackberries in good demand for preserving or table use.

The Producers Price Current says:—We are glad that there is a movement among dealers in apples to prevent the use in this State of the "pony barrel," a package of uncertain and irregular size the design of which is to cheat the community. In this effort the dealers will now be aided by the law, the last legislature having made it an offence, punishable by fine, to use or make for the purpose of using for the sale of apples, quinces or potatoes, a barrel holding less than 100 quarts, dry measure. At the same time efforts are to be made to induce fruit growers to use only the flour barrel of 196 quarts. The 100 quart barrel is only a lesser fraud than the "pony barrel," It originated as a chest and became so general that the legislature sanctioned it for certain uses, which it never should have done. We hope that the next legislature will pass an act prohibiting the use in this State of any barrel for dry packing holding less than 196 quarts. As a means of inducing apple growers to use for the large crop of this season only the flour barrel, it is proposed that the standard prices shall be for apples in barrels of that size and that 25c. less shall be paid for the 100 quart barrel, with a further discrimination of 25c. or more against the "pony barrel," in addition to the prosecutions under the Act.

Apples, Sweet Bough, ₱ bbl., $1.50@2; sour, do., $2.00@2.50; Red Astrachan, $2@2 50; common, 75c.@$1. Pears, California Bartlett, ₱ box, $4@6; Southern, fancy, crate, $3@5; Bell, bbl., $3@4; sugar, $1@3; Cooking, $1@2.50. Peaches, Del., extra, crate, $1@4.50; do., fair to good, $2@3.75; do., Ruskin's, $1@2.25; N. J., preservation, 50c.@$1. Plums, California, 20 ₱ box $1@4. Blackberries, ₱ quart, 10@12c. Whortleberries, ₱ bush., $1.75@2. Muskmelons, New Jersey, ₱ bbl., $2@2.50. Watermelons, Georgia, $15@25; Virginia, $8@15. Peanuts—Virginia, prime, ₱ bush., $1.65@1.85; Wilmington, $1.50@2; common, 90c.@$1.25.

GRAIN.—Wheat has advanced and is very strong, with increased export demand. Sales of prime No. 1 Milwaukee spring in store at $1.22; prime No. 1 Sheboygan, $1.25; No. 1 Minnesota spring, $1.15@1.18; No. 2 do., 98c.@$1.07; No. 2 Chicago spring in prime order $1@$1.05; No. 2 Northwest, $1.05; No. 3 Chicago spring, 81@85c; ungraded spring, 85c.@$1.05; amber Michigan, new crop, to arrive, $1.27; amber Delaware, new crop, choice, $1.25; white Tennessee, new, choice, $1.35. Rye depressed; prime Western, 60@60c.; State, 72@75c. Corn has been active and strong; sales at 54@58c. for ordinary steamer to sail lots of ungraded; chiefly sail grades at 57½@58c. for primo afloat and 57c. in store; steamer mixed ungraded at 55@57½c.; New York steamer mixed at 56c., and by steamer at 51c.; yellow Western at 58@59c.; hot and heated sold at 50@56c. Oats are active and favor the seller; sales at 37@50c. for fair to choice sound No. 2 Chicago; 41@41½c. for mixed State, and car lots do. up to 45c.; white State, 45@47c., and 50c. for strictly fancy; No. 2 Milwaukee quoted at 38@39c. bid, with up to 41c. asked for choice clowed and screened, and white Western at 41@45c.

HAY AND STRAW.—There is a better business, although receipts at full prices are without change.

Baled hay is quoted:—Shipping, 60@65c.; retail qualities 60@80c.; clover, 50@55c.; salt, 55@65c. Straw is quoted at 80@85c. for long rye; 60@65c. for short rye; 45@60c. for oat.

Exports past week 121 bales; since Jan. 1st, 31,765 do.; same time last year, 28,667 do.

The crop is said to be the best cured that has been known to commerce for many years.

HIGHWINES.—Are held higher with small receipts, quoted at $1.15.

HOPS.—Trade is still very light, on other than strictly prime lots which have a fair sale. Prices generally steady. The crop prospects are more favorable and in all probability there will be an average crop. We quote:

N. Y. State, 10@17c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c., ₱ ₱.

LEATHER.—Hemlock sole at 19@20c. for light; 20@23c. for middle; 21@23c. for heavy; 17@19c. for good damaged.

MILK.—Has ruled very low, having been in overstock almost every day. It has sold at the unpaying prices of 50c.@$1.25 for cans of 10 quarts, with a great deal returned. Commission men at the Harlem platforms suggest that farmers hold back at least one-quarter of the mess until the cool weather subsides.

PROVISIONS.—For hog products generally there is a hardening market on the better statistical position, and increased export demand. Mess pork quoted at $19.60 for spot and August and $19.70 for September. Bacon at 10½@10¾c. for long clear. Lard at $11.50 for Western steam on spot; $11.50 for August; $11.55 for September. Tallow, 8 5-16@8¾c. Stearine at 14½c. for prime Western. Beef hams at $31 for choice Western. Beef at $8@11 for plain mess, $10@12 for extra mess, and $14 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess.

POULTRY AND GAME.—We quote fowls, 13@18c. for scalded and picked; best spring chickens, 18@22c; other, 16@18c.; turkeys, 13@17c.

The market is easy for live. We quote spring chicks, near points, 16@17c.; Western, 15@16c. Fowls, N. J., ₱ ₱ 15@16c.; do. Western, 13@14c. Roosters, 9@11c. Turkeys, N. J. 12@15c.; do. Western, 12@14c.; Ducks, N. J., pair, 75c.@$1; do. Western, 50@60c.; Geese, N. J., $1.75@2 25; do. Western, 1.25@1.50.

Woodcock scarce. State quoted at 90c.@$1; Western, 80@90c. Stall-fed pigeons, $1.25@1.50; do. squab, 75c.@$1; tame live pigeons, ₱ pair, 30c.

SALT.—Quoted at $2.50 for Ashton; ground, 90c.; $1.15@1.40 for other brands.

SUGAR (Refined).—Declined a trifle. Soft yellow, 9½@10¾c.; soft white, 10¾@11¾c.; hard, 11¾@11¾c.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—Supplies are liberal, but exporters are buying more freely and at firm prices.

WOOL.—There is a more active market on demand from manufacturers, and a firmer feeling as regards prices. XX new Ohio fleeces sold at 38c., but at the close 2c. advance above this rate asked; X and XX, together, sold at 36@37½c.; Eastern Texas at 17@24c.; spring California, 18@23c.; Wisconsin unwashed fleeces at 23c.

ROCHESTER, Aug. 5.—Flour market dull; spring, $6.50; amber winter, $6.75; white winter, $7.00; double extra, $7.25. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.10@1.20; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@38c. Corn quiet at 58@62c. Corn meal, $1.50@1.55. Butter, 19@21c. Cheese, 11@13c. Eggs, 15@16c. Lard, 11@12½c. Apples, bu., 50@75c. Potatoes, bu., 80@90c. Beans, ₱ bu., 50@90c. Mess pork, $20.50. Wool, 20@50c. Hay, $8@10. Straw, $5@8. Timothy seed, $2.90@3.; clover, $3.50@4.10. Mill feed dull at $12 for shorts, $14 for shipstuffs, and $17 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Aug. 5, 1876.

THE Little Falls dairy market for the week ending Aug. 5 was more brisk and prices at the opening tended upward, so that before the market closed a ½c. over figures of last week was reached.

The delivery of farm dairies amounted to about 400 boxes, most of which sold for 8½c. A few lots went for 8@9c., while one lot was run up to 9½c. through the competition of buyers.

The sales of factories footed up considerably more than those of last week. Some 10,500 boxes were disposed of at the following prices:—Ten lots, 808 boxes, on commission; 2 lots, 300 boxes, 9¼c.; 12 lots, 1,705 boxes, at 9½c.; 7 lots, 7,589 boxes, at 9¼c.; 12 lots, 1,205 boxes, at 9¼c.; 1 lot, 30 boxes, at 8¾c.; 4 lots, 315 boxes, at 9c.; 2 lots, 101 boxes, at 8¼c. A few packages of butter sold at 22@24c.

We have advices from abroad for the third week in July. Our London correspondent says:—English cheese is very quiet. American of fine quality sells very readily and are not in large supply. Some extra fine are expected this week. Medium and low sell as landed. Dutch are thought to have reached their lowest. Quotations are as follows:

American, extra fine, 54@56c.; fine, 53@54c.; good, 46@50c.; common and low grades, 36@40c. English cheddar sells for 76@96c.; Wiltshire double, 56@58c.; Cheantre medium, 44@46c.; fine, 60@70c., Scotch, 58@60c.

LIVE STOCK MARKETS.

NEW YORK, Aug. 5, 1876.

What will the Weather

BE TO-MORROW?

The Signal Service Barometer

WILL TELL YOU.

It will detect and indicate correctly any change in the weather 12 to 24 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators.

FARMERS

can plan their work according to its predictions. It will save 50 times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. Will send it express paid to any address on receipt of $2.00. Send Money Order or Registered Letter.

Agents wanted—send stamp for Circular. H. W. POOL & CO., 835 Broadway, New York.

The Boston Traveller says:—"We carefully inspected the above-described Signal Service Barometer, and found it to be as stated by Messrs. Pool & Co., who are honorable and reliable."

NEW YORK STATE AGRICULTURAL SOCIETY.

36th ANNUAL

CATTLE SHOW & FAIR

At Albany, Sept. 11 to 15, 1876,

ON THE G[illegible]UNDS OF THE ALBANY AGRICULT[illegible]L AND ARTS ASSOCIATION.

Ample ner[illegible] stalls and buildings, steam power for machiner[illegible] forage for stock, free of charge.

Copies of the [illegible]ium list and blank forms for entries will be sen[illegible]mailed to all applicants.

Competition fo[illegible]remiums open to all, but all entries must be mad[illegible]ersonally or by letter, at the Society's office, in Albany, on or before August 12th, excepting entries of fruits and flowers, which may be made up to 10 o'clock A. M., on Tuesday, Sept. 12th. Address STATE AGRICULTURAL SOCIETY, Albany, N. Y.

The Celebrated Eclipse Wind Mills

Pump water from WELL, SPRING or RIVER, and force it to any height or locality, for HOUSE, GARDEN, BARN or STOCK use; also grind feed and meals, saw wood, &c. Greatest invention of the age. A wind mill that does not blow away. Perfectly self-regulating. A solid wheel with no loose sections or joints. Can not freeze up or get out of order. AWARDED 96 1st premiums. Illustrated Circulars free.

Eclipse Wind Mill Co., Beloit, Wis.

Eastern office, A. J. COCHRAN, 76 John St., N. Y.

PERSONAL ITEMS.

VON BU OW is lying dangerously ill in Germany.

"BACHELOR of oars" is Cornell's latest degree.

THE widow Van Cott says she has converted 20,000.

THE Rev. Samuel Butcher, Premier Bishop of Ireland, is dead.

MR. MORTIMER COLLINS, the English poet and novelist, is dead.

PROF. HAYDEN hopes to complete the geological survey of Colorado this summer.

"THAT Crazy Horse of the press" is what the Richmond Whig calls the Herald.

IT is proposed to send an amateur brass band to Montana and make the Indians go West.

A ROCKY MOUNTAIN editor describes the hanging of two murderers as a "necktie festival."

THE Rev. W. S. Perry, formerly an Episcopal clergyman in Nashua, has been elected Bishop of Iowa.

THE Athenæum describes the Turk as an infidel who believes in God and finds his enemies in the Christians.

SITTING BULL proposes to winter in Canada, and the Canadian authorities call for troops to guard its frontier.

DON CARLOS'S recent heroism in a dentist's chair only confirms our belief that he is a gentleman of noble extraction.

JAY COOKE'S Island of Gibraltar, in Lake Erie, is wanted by the State Medical Society of Indiana, which is trying to buy it.

THE reports of Sojourner Truth's death are met by a counter-report that she is living in Michigan. But, that's just about as bad.

AT Lansing, Mich., recently, a young man named Harris caught in Grand River a bass with a full grown live mouse in it.

S. L. EVANS of Salt Lake, has within three months married the mother and the aunt of a wife that he already possessed.

WHETHER or not the rain falls upon the just or upon the unjust, depends upon the fact as to which one has the best umbrella.

THE Turkish Commander Suleiman Pasha avows his intention to annihilate the Servians, or to Divan-quished in the attempt.

SAYS an Omaha obituary:—"He was a splendid penman, a systematic bookkeeper and a systematic drinker." It explains everything.

TWO young men have just fought a duel in New Orleans, but the grazing of one arm by a bullet was sufficient bloodshed to satisfy them.

A SPECIAL from Rockbridge, Alum Springs, Va., says that Speaker Kerr's symptoms are very unfavorable, and his condition is regarded as critical.

AN exchange says that Texas watermelons weigh fifty pounds apiece. We've seen some that weigh more than that, *i. e.*, after you've eaten them.

IT is now definitely settled that Moody and Sankey will begin their labors in Chicago about the first of October, and in Boston about New Year's.

IT was rather personal in a California newspaper man to chronicle the purchase of a mule by a brother editor as "a remarkable instance of self-possession."

THE Emperor of the Moors, it seems, has been selling hundreds of his rebellious subjects into slavery, and several thousand more of them still remain bound in Morocco.

WENDELL PHILLIPS put the paint on very much as an Indian does, but he doesn't wear the ring in his nose as gracefully as the native red man. That's what gives him away.

WATER can't kill a Chinaman. One went up in a Nevada water-spout the other day, landed two miles away, and coolly got up and inquired what had become of his chop-sticks.

ON one of the bodies found on Custer's battle field, that of a German soldier named Ackerman, there were no fewer than seventy-five wounds. All the limbs had likewise been hacked off.

MR. MOODY'S church in Chicago was dedicated last Sunday week. It cost $67,000, and is all paid for—a condition which Mr. Moody insisted should precede its dedication. The lot cost $22,000 more.

A HARTFORD boy who has arrived at the Black Hills writes home that men are making $40 per day there, and hopes his family won't write often, as he has to pay fifty cents for every letter he receives.

THE correspondent of a weekly newspaper complains of the bias so frequently shown by county J. P's. How can we wonder that so much so-called justice is biassed when it is administered biasses?

REFERRING to the base slander that the Woman's Pavilion at the Centennial is very dirty, the Rochester Democrat asks, in an angry tone, if one can strike for freedom and do housework at the same time?

MAJOR F. DAWSON of Upper Arracan, of the Survey Department of India, killed the largest tiger known, on the 23d of May last. The tiger's body, from shoulder joint to root of tail, measured 8 feet 7½ inches.

IN 1759 George Washington, in sending to London for some goods, put upon the memorandum "9 pounds of sugar candy." This must have been during George's courting days, and the peanut crop was a failure that season. He would have ordered gumdrops, but they had not yet been invented.

A NEW YORK lemonade dealer is said to have increased his sales largely from having been seen twice to drink his own lemonade, but it is not told whether he was seen to take an antidote immediately afterward.

A BOYISH novice in smoking turned deadly pale and threw away his cigar. Said he, "Thar's somethin' in that air cigar that's made me sick." "I know what it is," said his companion, pulling away. "What?" "Tobacker."

A MARRIED man from L'Anse, Mich., at Waupaca, Wis., arranged with a pretty Swede girl to elope with him, and gave her $200 to purchase an outfit. She took the money, told the scamp's wife about it, went home and stayed there.

A HUNDRED years ago when you called on a girl she kissed you good-by. Now if you suggest anything of the sort her father calls you into the library and asks you what you are worth. Are we a nation? And is this progress?

CHURCH fairs work as follows:—Some ladies borrow money from their husbands, buy materials and make up fancy articles, which they give to the fair. They then change places, borrow more money and buy the articles back again.

CAPTAIN GENERAL JOVELLAR, it is rumored, has sent in his periodical resignation. We thought it was about time for him to begin to hanker after his regular trip to Spain. Possibly he wants to participate in the approaching nuptials of Alfonso.

AT one of the great hotels of Chicago the waiters politely hand each guest a morning paper after he has given his order for breakfast. This keeps about sixty papers moving around for three hours or so, and pays in popularity more than it costs.

A COCKNEY at the Falls of Niagara, when asked how he liked them, replied:—"They are 'andsome, quite so; but they don't quite answer my hexpectations; besides, I got thoroughly vetted, and lost my 'at. I prefer to look at 'em in an hengraving, in 'ot weather, and in the 'ouse."

A FELLOW-FEELING ought to make Queen Victoria kind to the Sultan. It is estimated that in her Eastern dominions the Empress of India rules over 896,858 Christians and nearly 50,000,000 Mahometans. She has nearly 10,000,000 more of Mahometan subjects than the Sultan himself.

IT is not generally known that Dr. Oliver Wendell Holmes is the inventor of the common hand stereoscope. Such is the fact, however, and his work has been given to the world without the protection of a patent. He has an immense collection of stereoscopic views from all parts of the earth.

MEMBERS of the Yale College Class of 1853 are just now coming to the fore. A. H. Bishop is the Republican candidate for Governor of Arkansas; H. C. Robinson will be the Republican candidate for Governor of Connecticut, and E. W. Seymour will, in all probability, be his competitor on the Democratic ticket.

A YOUNG lady at a Worcester church, whose bustle became loosened, rid herself of the troublesome article so neatly that even the young man who accompanied her did not notice any change in her form. Those who were in the aisle behind were not so blind however, and gave it a wide berth as they passed by.

THE report that Miss Thompson, the young English artist who painted the "Roll Call," has forsaken military for sacred art, is pronounced anything but correct by the London Academy. Miss Thompson could not turn Roman Catholic, being such already, and she is now engaged on a pieture of the battle of Inkerman.

ATTENDANCE at the Centennial is not as good as it was. Boarding-house keepers who started out early in the season with roast beef and plum pudding for dinner every day, and were very particular about who they took, now understand all the mysteries of hash manufacture, and chase up every man with a valise in his hand for two squares from the depot.

THIS world is full of bitter disappointments and sudden trials that break upon us like thunder from a cloudless sky, but at no time is the soul of patient, much-enduring man so hardly tried as when he goes to shave himself in a great hurry Sunday morning and discovers at the first pull that his wife had opened a can of peaches with his razor Saturday night.

AN Italian now stopping at the Irving House, Philadelphia, has a wooden monument three or four feet square in his possession, on which is an immense number of figures representing various stages of the world's history, from the creation to the crucifixion, showing great skill and patience, and revealing by the aid of a glass some fine work. This affair is said to be seven hundred years old.

OF all the celebrated lovers of George Sand, two only survive—Jules Sandeau, the first love of that passionate, undisciplined heart, and Prince Napoleon. Jules Sandeau, who is the first novelist who ever gained by reason of his novels alone a *fauteuil* at the Academy, is still a very fine-looking man, bald and stout it is true, but still of a pleasant and comely presence, and of peculiarly graceful and winning manners even for a Frenchman.

IT will be news surprising to many to learn that the brave General Custer was of foreign birth. He was born in Ispringen, near Prorsheim, in Baden, Germany, and emigrated when a child with his parents, who settled in New Romely, Harrison County, O. Formerly his name was written "Custar." Since his return from a trip to Germany, however, he appears to have written "Custer," his original family name, however, being Kuester.

Manufacturers of Agricultural Implements,
Higganum, Conn.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lane of Life.*

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

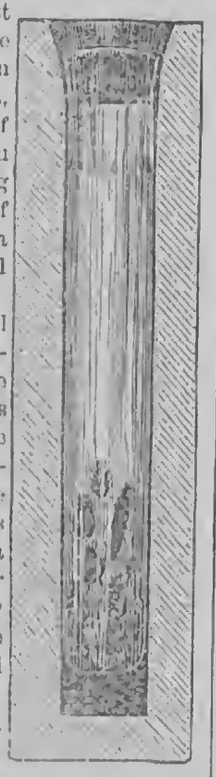
Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

ANSWERS TO CORRESPONDENTS.

DEAR MR. EDITOR:—The RURAL contained many good recipes for jelly cake, chocolate cake, etc., etc., but if some one will be kind enough to give a remedy for that pest of our house, the "red ant," we would be very much obliged. This persevering intruder is into the sugar barrel, the cake box and jelly cup, in fact everywhere. We have tried magnetic powder, sage leaves and black pepper, but they do not have the desired effect. Water will do, but who wants a small lake in the store-room, and the cake box or sugar barrel on stilts? As I am very fond of all the good things, I *do* hope some one will send a sure remedy. ANDE.

We fully sympathize with our correspondent and her long-looked-for something which would drive away the pests and, at the same time, not be disagreeable to have about. Camphor will keep them out of a tight vessel, but is of no use in an open store-room. Creosote, benzine, and similar liquids which would drive away the ants, are not to be tolerated in rooms where anything eatable is stored. Perhaps some of our correspondents can give a sure preventive, if so, let them send it along.

Mrs. D. C. Hobart, Homer, N. Y. (1) My pinks look as though they were frost bitten. I find a small white worm in the joints. Will you tell me, through the RURAL, the cause and the remedy, if there is any? Also (2) will you describe the Night-Blooming Cactus, plant, color and size of flower? Does it grow like a common kind called Hen and Chickens?



ANS.—(1) We cannot tell what the worm is without seeing it. For those who have occasion to send us specimens of this nature, we suggest the use of the accompanying simple contrivance. Bore a hole in a piece of wood as large as the vial. Pour in the vial a little alcohol upon the worm or insect. It may then be sent by mail in perfect safety and the specimen may be determined with certainty.

(2) The Night-Blooming Cactus is a native of the West Indies. The flowers expand by night and endure but a few hours. Sepals, brown without—yellow within. The petals are white, an inch diameter. The stems are cylindric or angular. Botanical name, *Cereus grandiflorus*. The name of Hen and Chickens is *Sempervivum tectorum*—perfectly hardy, growing from walls or roofs. The "chickens" are the runners which it sends out from the axils of the leaves. House-leek.

A. M. Van Auken.—The grub found boring into your tomato plants is probably the larva of *Gortyna nitela*, GUEN, but the specimen sent was completely dried up and past recognition. We cannot suggest any preventive beyond digging out and killing the grubs whenever found.

Inquirer.—The double Tiger Lily, except as a novelty or to complete assortments, is in no way more desirable than the old single form. It increases just as fast, and will doubtless sell, in a few seasons, for the usual price of such bulbs. The present price is $1.00 per bulb, to be procured of most florists and seedsmen.

Dyspeptic.—It is quite true that our hygienic authorities, in the main, agree in denouncing hot bread of all kinds and at all times; but we also believe most of them speak, from theory instead of experience or a positive knowledge. Of course we are not disposed to advocate the use of hot bread in preference to cold, still we have good reasons for believing that there are as few dyspeptics among those who use new and hot bread every meal in the year as those who never touch it. Anyone who has been among the hardy frontiersmen, know how rare it is to see stale or cold bread of any kind eaten, and it would be difficult to find a dyspeptic among them. New bread, hot soda or other biscuits, may not agree with one person's stomach, and, at the same time, be not only harmless, but agreeable and healthful to another.

J. W. Maple.—We are not positive as to the identity of the insect which you refer to under the name of the "Ground or Blue Apis," but presume it is one of the numerous species of Aphides or plant lice. For those species which infest plants above ground, there is nothing which will destroy them sooner, and at the same time not injure the plants, than tobacco water. This might also be used for drenching the root-inhabiting species, or kinds, as the case may be. Lime water and a moderately strong solution of potash will sometimes kill these pests.

A Temperance Deacon.—The loss of the recipe for making the Rev. Mr. BOWDITCH'S "Sacramental Wine" is not an irreparable one, for we have preserved it and here it is: "Take any kind of ripe grapes and boil with a small quantity of water until reduced to a pulp; strain through fine muslin, and to every gallon of juice obtained add from three to four pounds of common sugar; then boil the juice over again, and pour, while hot, into airtight jars or bottles, which must be closely sealed. The wine will begin to ferment in a few days if exposed to the air." But we are at a loss to know how any sensible man, or committee of men, could be bamboozled into thinking such a slop had any of the properties of wine. Rye straw, or bread might, with as much propriety, be called rye whisky, as boiled, sweetened, unfermented grape juice be called wine, and it is an insult to a Christian to offer him such trash at the communion table.

Apiarian.—FRANCIS HUBER, the naturalist, who made so many discoveries in regard to the habits of the honey-bee, was born in 1750 and died 1830.

F. Pine.—I send you a Cactus for name. It is seven years old—has never bloomed. Can you tell me how to make it bloom?

ANS.—It is *Opuntia Peruviana*. We have one five feet high that, like yours, has never borne a flower. We can only say that this plant requires dryness and heat. Give it sandy loam, rubbish, broken bricks, and no water during the entire winter. In the spring, plant it in a sandy, hot place.

M. A.—In the front part of our grounds is a sandy elevation upon which nothing will grow, that is, in the way of shrubs and trees. We have tried young Maples and Horse-chestnuts and evergreens among trees, and among shrubs the Deutzias, Dogwoods, Hydrangeas and others that I can not think of. You will greatly oblige us by mentioning three or four species of trees and shrubs that *will* grow.

You should first dig large, deep holes and fill in with good soil. Try then, in the way of evergreens, any of the Pines, such as the Austrian, Scotch or White, or the Red Cedar, Juniperus Virginiana. Any of the Locusts, such as the Moss Locust, Robinia Bessoniana or R. viscosa The beautiful Laurel-leaf Willow, we believe, would thrive in such situations. Among deciduous shrubs you may try the common Privet—Forsythias—Spiræa Prunifolia—standard Honeysuckles, such as Lonicera Leddebouri, L. Xylosteum, Fortuni, Standishi—Lycium barbarum and the Japan Quinces.

Rural Reader, Northville.—It has occurred to us that the plant you sent for name may be a *Polygala*. Will you favor us with a specimen of flowers placed in a little box or wrapped in a bit of cotton?

Jno. G. K. Kulle, Lovettsville, Va.—I have been budding the Kilmarnock Willow a dozen years without the least success—have budded early and late and all through the season. The stocks I bud on are from sprouts of the stem of a tree I bought budded with the Kilmarnock, and resembles it in foliage considerably, and I suppose it to be the proper stock for it. (2.) Why is it our Alternantheras lose every vestige of their line markings when bedded out? We have a number of varieties and all behave alike. Our soil is a good clay loam. (3.) Please also tell me how to propagate Daphne odorata. It seems exceedingly difficult to manage.

ANS.—*Salix caprea* (Goat Willow) is the best stock for the Kilmarnock and that almost exclusively used. The best time for budding is during the second and third weeks of July. The best time for grafting is about the end of April. Grafting is preferable. We do not see how you could bud "all through the season," since buds are not always developed and are only fit to be used—as you must be aware—at certain periods.

(3.) *Daphne Indica alba* (*odorata*) may be easily struck if the wood is not too old. The plants from which cuttings are taken should be vigorous, and cuttings of the *ripe green* wood may be taken in March. You will find no trouble in November if the cuttings be not too strong and well ripened. Easily raised from seed.

(2.) Why *Alternantheras* lose their colors, it is impossible to say. It is so with all variegated plants, more or less. The variegation is more tender than the green, and so disappears when subjected to the heat, dryness, etc., of midsummer weather.

S. A. Pinney, Emporium, Pa.—I wish you would inform me who I could write to in the city of New York that could give me information in regard to digging Ginseng roots and as to how it should be prepared for market.

ANS.—The roots may be dug now or later. You have only to remove the fibers and stems and dry in the sun.

A tincture is made by adding the roots and berries to alcohol.

All wholesale druggists purchase the roots.

ANS.—It may be found in *Hort Belge*, 1836, p. 97, that M. MECHAM received in 1812 seeds of Pavia from North America, which were sown by M. CARMUZET in the Paris Garden; and among the plants which came up was one different from all the others, which is the Aesculus rubicunda of the gardens. It flowered in three years. It is singular that the Horsechestnut is not more freely raised from seeds.

NOTE.—Several letters remain over for next week.

Agents Wanted.

5,000 AGENTS WANTED.—Samples sent free by mail, with terms to clear from $8 to $10 per day. Two entire new articles, salable as flour. Address H. B. WHITE & CO., Newark, N. J.

$57.60 AGENTS' PROFITS PER week. Will prove it or forfeit $500. New articles, just patented. Samples sent free to all. Address W. H. CHIDESTER, 218 Fulton Street, New York.

AGENTS If you want the best-selling article in the world and a solid gold patent lever watch, free of cost, write at once to J. BRIDE & CO., 767 Broadway, N.Y.

ARE YOU OUT OF EMPLOYMENT? Send for our Illustrated Catalogue of Subscription Books, many of which find a ready sale even in these times. Some of our agents are clearing ten dollars per day. D. APPLETON & CO., Publishers, 549 & 551 Broadway, New York.

Traveler's Guide.

JOHN CRUMP, - - Proprietor,

Chestnut St., cor. 15th,

PHILADELPHIA.

CALIFORNIA.

Have you any thought of going to California?

Are you going West, North or Northwest?

You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTH-WESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oshkosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO,

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York,

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

Wit and Humor.

THOUGHT SHE KNEW.

THE passengers in the sleeping coach were just dozing off when something howled out:

"Ow—wow—wow!"

"Great dragons, there's a young one aboard!" growled a fat man from his upper berth. "I'll bet a hundred dollars none of us can get a wink of sleep to-night."

"Wow—wow!" whined the child.

"There he goes again!" growled the fat man. "I never travel but what I run across some one's howling offspring."

"Who's that talking?" called the mother of the child in a loud voice.

"Me!" answered the fat man.

"Why didn't you either leave that child at home or stay home yourself!"

"Are you talking to me?" demanded the woman.

"Yes, ma'am, I am! I say its a shame to bring a sick child into a sleeping car to disturb twenty or thirty people."

"Are you a father?" she asked.

"No, I hain't."

"Nor a mother?"

"No, ma'am."

"Well, sir," she said, as she poked her head out between the curtains, "when you've been the mother of eleven children, moved forty-eight times, lived in nine different States, and worn one corset right along for seventeen years you'll begin to think you know your business. I think I know mine and if this baby want's to howl he's going to do it, if I come over there and kick a ton and a half of conceit out of you."

WEALTH WITHOUT ITS ANXIETIES.

THE newsboys who gather about in the afternoon awaiting the publication hour of the Evening papers are either fairly rolling in wealth or their conversation is to some extent imaginative. Said one of them to another.

"Billy, did yer buy that $50 plaid summer suit I seed yer lookin' at in a winder Saturday?"

"No, Blinkey, I didn't take it in. Ther was only one watch pocket in the trowsers an' a allus carries two tickers, one ter c'rect t'other by."

"But yer ain't goin' ter wear yer army britches all summer, be yer, 'specially when yer go driven evenin's?"

"No, Blinkey, my dear, I ain't," was Billy's grave reply, "but don't yer worry about me, It's silk undercloz as preserves, my precious health. Silk's the thing, Blinkey."

THE FAVOR HE ASKED.

THE San Antonio (Texas) Herald says:—A few days ago, a prisioner, with a face on him that excited much remark, on account of the meanness of his expressian, was brought into the district court to be sentenced to Huntsville for stealing some clothes off a line. As he was known to be a very slippery character, one of our handsomest and most vigilant deputy sheriffs took a seat by his side. After awhile the prisoner leaned over and whispered to the officer: "Won't you do me one little kindness." The officer promised to do so, with one of the kindest smiles we have ever seen in a court-house. The prisoner whispered:—"Then, sit a little further off: I'd rather pay a hundred dollars than have people take me for a deputy sheriff."

SPARKS AND SPLINTERS.

BAD farming—Baby farming.

ALWAYS in debt—The letter B.

JUST the place for babies—Rockaway.

GOOD tune for an old smoker—Spittoon.

A MOVING tale—That of a bull in fly time.

HANDY for a double-scull race—The two-headed girl.

AN Indian occassionally makes an arrow escape.

CAN chiropodists be said to practice the heeling art?

THE grocer's motto—"Learn to labor and weigh "t."

APT to make children ugly-tempered—Living on a cross street.

"I WISH I was a pudding, mamma." "Why?" "'Cause I should have a lot of sugar put into me."

THERE may be recipes to cure the potato bug, but there is nothing so sure as to blindfold him and back him under a pile driver.

AS soon as the novelty wears off, sententiously observed Mr. Bloggs, a man never wakes up a baby for the purpose of making it laugh.

QUILLS are things that are sometimes taken from the pinions of one goose to spread the opinions of another.

THE NEARER THE BONE THE SWEETER HIS REVENGE.

Thin Party—Aha! You *did* laugh at me last winter for being thin! Who,s got the laugh now, with the thermometer in the nineties?

"THE VIBRATOR."

1,000 SOLD LAST SEASON
WITHOUT ONE FAILURE OR REJECTION.

This is the famous Threshing machine that has "swept the field" and created such a revolution in the trade, by its MATCHLESS GRAIN-SAVING AND TIME-SAVING principles.

THE ENORMOUS WASTAGE of grain, so *inevitable with other styles* of Threshers, can be SAVED by this Improved Machine, *sufficient, on every job, to more than pay all expenses* of threshing.

FLAX, TIMOTHY, MILLET, HUNGARIAN and like seeds, are threshed, separated, cleaned and saved, as easily and perfectly as Wheat, Oats, Rye or Barley.

AN EXTRA PRICE is usually paid for grain and seeds cleaned by this machine, for extra cleanliness.

IN THE WET GRAIN of 1875 these were substantially the ONLY MACHINES that could run with profit or economy, doing fast, thorough and perfect work, *when others utterly failed.*

All GRAIN, TIME and MONEY wasting complications, such as "Endless Aprons," "Raddles," "Heaters," "Pickers," etc., are *entirely dispensed with*; less than one-half the usual Gears, Belts, Boxes and Journals; easier managed; more durable; light running; no costly repairs; no dust; no "litterings" to clean up; not troubled by adverse winds, rain or storms.

FARMERS and GRAIN RAISERS who are *posted* in the large saving made by it, will not employ inferior and wasteful machines, but will *insist* on this improved Thresher doing their work.

FOUR SIZES made for 6, 8, 10 and 12 Horse Powers. Also a specialty of SEPARATORS designed and made EXPRESSLY FOR STEAM POWER.

TWO STYLES OF HORSE POWERS, viz.: our improved "Triple Gear," and our "Spur Speed," (Woodbury Style), both "Mounted" on *four* wheels.

IF INTERESTED in Threshing or Grain Raising, apply to our nearest Dealer, or write to us for Illustrated Circular (sent free) giving full particulars of Sizes, Styles, Prices, Terms, etc.

CONSUMERS' IMPORTING TEA CO.,
No. 8 Church Street,
P. O. Box 5509. NEW YORK CITY.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprize, as we make a specialty of SUPPLYING CONSUMERS ONLY, (and allow no middlemen to make any profit on our importations,) which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in large cities and among the very wealthy. SEND FOR PRICE LIST.

H.W. JOHNS' PATENT.
ASBESTOS
MATERIALS.

Asbestos Roofing, for steep or flat Roofs.
Asbestos Roof Coating, for old Leaky Roofs.
Asbestos Cement, for repairing Leaks on Roofs.
Asbestos Roof Paint, for Tin Roofs, &c.
Asbestos Paints—all colors—ready for use.
Asbestos Fire Proof Coating, for wood work.
Asbestos Boiler and Steam Pipe Coverings.
Asbestos Steam Packing, flat & round, all sizes.
Roofing Sheathing, &c. Ready for use, and easily applied. Send for Pamphlets, Price-Lists, &c.

Floricultural.

MOLUCCA BALM.—SHELL FLOWER.
(Moluccella laevis.)

Last fall we received seeds from a correspondent labeled "Shell Flower—Molucca Balm." He described the plant as being so odd and pretty that we planted them at once. They germinated quickly, grew vigorously with little care, and were planted in the open ground the latter part of May—soon after which they began to display the remarkable characteristics for which they are distinguished. Two weeks ago we lifted one of these plants, placed it in a pot, had it photographed and engraved, and now present to our readers the result—gratified that we are thus enabled to call general attention to a plant that, from the admiration and curiosity it has excited in the Rural grounds—in the Rural office, and while we have been carrying it, or branches of it, hither and thither, promises to be received with no ordinary favor. That it may be raised from seed as easily as a Balsam, Zinnia or Pansy; that it will thrive during the severest drouths as well as a Cactus or Sedum, and requires a soil no richer than either; that it does not need to be tied up or supported by stakes, the branches being strong enough to support themselves the same as if they were hard-wooded, are items which may give confidence in the above prediction.

We may say that the district of country in which the Rural grounds are located have suffered during this season from the most protracted and damaging drouth ever known to the oldest residents of that locality. It has been impossible to keep tender annuals alive except by copious nightly waterings. The grass of many lawns has been burnt to death, root and blade. Many shrubs not easily affected, such as Deutzias, Privets, flowering Plums, Viburnums, have drooped, lost their leaves and died. Deciduous trees and evergreens transplanted this spring have, with few exceptions, been either killed or so badly scorched that they can never recover—and the sight of old Norway Spruces and Arbor-vitæ trees dead and dying is not uncommon. Meanwhile the Moluccas, growing in a bed elevated one foot above the surrounding level and not once watered, have flourished as if every element of their well-being were amply supplied. With the engraving upon this page of the entire plant, and one of its several members upon the fourth, our readers by the aid of the following description may gain as clear an idea of the Molucca as if it were growing beside them. For sections of flower, etc., see page 120.

The hight of the plant figured is two feet two inches. The stems are square, rounded at the edges, of a light green color and smooth. They are opposite, spreading out and curving upward like the arms of a candelabrum. The nodes at the base are two inches apart, growing closer at the top, which ends in a tuft of leaves and tiny cups. Three cups (Fig. 1) spring from the axils of each leaf. As the leaves are opposite, there are six—sometimes seven—crowded in a whorl. Upon the tallest stem there are fifteen whorls (ninety cups), so that it is literally covered with them. Underneath each cup are three slender spines half an inch in length (Fig. 1). The cup or calyx, as it must be considered, is very smooth and entire, except at the edges, where it presents five mucronate points corresponding with the clefts of the lips of the corolla. It is of a light green color, prettily veined with whitish-green, recalling the reticulate leaves of the Golden Honeysuckle (Fig. 1).

Within the calyx first appears the white, velvety bud (Fig. 2), resembling a button, that unfolds into a flower (Fig. 3), which is white and purple, included within the calyx (Fig. 1) and little more than half its length. Besides enduring but for a day or so, it is scarcely discernible at a distance and adds a trifle only to the appearance of the plant. After the fall of this corolla, we have the fruit (Figs. 5 and 6), consisting of four separable nuts or achenia—first of a bright green, changing to a dark-brown color when ripe. The leaves are few, Fig. 4 representing the larger lower leaves—Fig. 7 the upper or smaller ones. The petioles are rather long and they have the peculiarity of twisting unequally, so that the surfaces of the leaves, instead of being horizontal, rest horizontally, perpendicularly, and at every intermediate angle. Perhaps more rest perpendicularly, presenting the edges to the sky and earth, than in any other position, a peculiarity existing in but very few plants.

There are two species of *Moluccella*, viz., *laevis* and *spinosa*. The latter differs from the former in possessing purplish stems, smaller leaves, smaller cups with seven spiny points, and in being less hardy. This is a native of the Molucca Islands—hence the name of the genus; but *laevis* is a native of Syria.

MOLUCCELLA LAEVIS.

Our readers would like to know to what extent this plant has been and is cultivated. We cannot tell them. We find it mentioned in Philip Miller's Gardeners' Dictionary, published in 1758, and in recent botanies generally. Yet we cannot find it offered in any catalogue either of this country or of Europe, and we know of but one individual besides the correspondent who sent us the seed that has the plant in cultivation. We have ourselves about twenty plants, and the seeds are carefully saved as they ripen. These we hope in some way to distribute among our Rural readers, of which, in order to avoid unnecessary correspondence, we will give timely notice.

NOTES.

One of the employes of the R. N. Y. brought into the office the other day five Dahlia flowers upon one peduncle. They were so crowded together that they could only be distinguished by the greenish center petals of each.

The Scarlet Lobelia, or Cardinal flower, is just now making the swamps, ditches and low grounds throughout the Northern States, brilliant with its showy plumes. It has few rivals in color, although not very compact or elegant in form.

We found in a ramble last week a quantity of the little Orchid, *Goodyera pubescens*, now in bloom. The minute flowers, about fifteen of which are crowded in a raceme upon a scape a foot or less high, are just as interesting in a very small way as are those of the Cypripedium on a larger scale.

We see in the Gardeners' Chronicle that a correspondent sent the editors two trusses of the blooms of the Hydrangea, cuttings of which were taken from the same plant and both of which had received the same treatment in every respect—having been potted in ordinary turfy loam, leaf-mold and sand, and watered with pure spring water. The editors state that one was quite pink, the other pure blue. If no mistake was made as to the cuttings, this goes to prove that iron, the soil, etc., have nothing to do with changing the pink to blue in the flowers of Hydrangeas, in spite of the mass of supposed facts that from time to time has been published in substantiation of this theory.

Perhaps Hydrangeas are divided among themselves, some preferring blue, some pink. Perhaps they are mixed as regards these two colors, sometimes manufacturing one—sometimes the other. Perhaps in being lifted from one position, to which they have become endeared, to another—they grow melancholy and ——blue. This last, as we study upon it, seems plausible, and we respectfully offer it as our explanation of the phenomenon.

EXCHANGE.

I noticed in the Rural of July 8 a letter by "Marion, Noble Co., Ind.," giving a description of a plant, and in which she asks for the name. I raised it years ago and called it "Shell Flower." I have since lost the seed, and have anxiously looked through seed stores and catalogues for years, but in vain. So you may know how delighted I was on reading this description. As the little shells skeletonize beautifully, I am most anxious to procure some of the seed, and determined, as the writer of the letter alluded to did not give her post-office address, to write to you immediately, begging you, through the medium of your paper, to let her know my address, which is "L. Hinder, Kalamazoo, Mich." If she will be kind enough to send me a few seeds, I will return the compliment by sending her some of several kinds that perhaps she has not yet seen.

Around the Republic.

FROM OLD CONNECTICUT.

DEAR RURAL:—The western boundary of this township, as stated by me in a former letter, is the summit of a range of hills from 600 to 1,000 feet above the Connecticut River, which is, in a direct line, some nine miles distant. These hills, known as Talcott Mountain, are of trap rock, which have, by some igneous eruption, been thrown up through the old, red sandstone, and trend from Mount Tom in Massachusetts southwardly to East Rock, near New Haven. The eastern side descends quite abruptly (but not so much so as not to be generally cultivatable) for nearly two miles, at which point the trap formation is lost sight of, and from whence there is a quick succession of hills and valleys, which regularly diminish in size until, in the eastern part of the town, a sandy level is reached, which continues to the river. Thus, within the limit of a single township, or a little more than six miles, we have a variety of soil and formation not often comprised in the same distance. First, on the eastern side, sand with but little loam, followed by a moderately heavy loam with clay subsoil, then a loamy gravel, and finally rocks and stones in abundance. This gives opportunity for great diversity of agricultural pursuits, although the productiveness of either portion is not so great as to give the farmer desired results without his strict attention and unremitting labor.

The most valuable production here, as in all New England, is grass. No farm can be kept in good condition without an ample supply of barn-yard manure, to obtain which the larger number of acres the farm contains are kept in grass, which is fed out to stock in winter. But little hay is sent to market, it being generally believed that he who sells his hay robs his farm, for even if the money it produces be expended for phosphates, guano or other fertilizers, the result in the end is not so favorable as if the hay be fed out on the farm. Stock raising, as a business, does not seem to be largely engaged in. There is but a small proportion of the land that is not worth more for culture than for pasturage, and it is thought more profitable to buy cattle two or three years old in the fall for winter feeding than to raise younger stock.

The season seems unusually early, and most of the grass was cut before the 1st of August. The crop was rather better than average and was housed in good condition. But hay making now is different than when I was young, when, with scythe, and fork, and rake, man and boy must toil and sweat "from morn till dewy eve," often commencing in June, before the grasses were nearly ripe, and frequently continuing into September, when the stalks were so dry and hard that the scythes would ring out their notes as clear and sharp as the triangles in an orchestra.

From the window where I write I can see where was once a field of about eight acres, in which my grandfather had accomplished a prodigious feat that I have often heard related as a marvel of wonder and proof of his uncommon energy. When the grass was fully ripe, on a favorable day, he put sufficient hands at work to cut, cure, gather and house all the product of that field in a single day! Think of that, ye modern farmers, who leisurely mount your mowing machines and, after a not wearisome ride over a few acres, exchange for a tedder, and afterward for a rake, riding about the while and dividing the labor with your horses; and not quite such division either as the Irishman had who wrote to a fellow countryman that if he would come to America he would get him a job where all there was to do was to carry bricks to the top of a building, and the fellows up there would do all the work. But speaking of division of labor suggests a query: Why is it that in storing or mowing away hay the boys are always put in the hottest place? I see a roof now under which thirty years ago I toiled and sweat and inwardly cursed (I was a boy then), and in my recollection that is the hottest place I ever heard of, unless it be Philadelphia or the foreign place TALMAGE talks about, but which is not mentionable in polite society.

Indian corn (why can't you educate the public to call it *maize!*) is cultivated to a limited extent. Every farmer needs a little for his pigs and poultry, but every bushel raised in town doubtless costs more than it would sell for in market. But the argument in favor of growing it is, admitting a certain quantity to cost a hundred dollars, and it could be purchased for ninety, where will the farmer get his ninety dollars with which to pay for it?

I find a question still unsettled that was discussed when I lived here, namely, If it be more profitable to raise corn on the light, sandy soil (known as the plains), which is easily worked and produces ten bushels to the acre, or on the heavier soil, that produces four or five times as much, the latter costing a hundred dollars an acre and the former ten dollars.

As with corn so with other ordinary farm crops, rye, oats, potatoes, etc., but little is raised except for home consumption. The money-producing crop of the town is tobacco, of which a large amount and superior quality of Connecticut seedleaf is raised. I will write more fully about this at another time. Just now I want to go to the station to see a party off for the Centennial, with which are two of my oldest friends—one aged 81, the other 83, both practical and successful farmers, who are still able to "drive the team a-field" and do a pretty good day's work if circumstances required. L. A. R.

Bloomfield, Conn.

Farm Economy.

THE LIGHTNING-ROD NUISANCE.

EVER since Benjamin Franklin made his experiments in capturing electricity, timid persons have wanted some kind of a kit and string hanging over their heads on a thunder storm and this weakness has been taken advantage of by the peddlers of lightning-rods. How these men have fattened on others fears is told by the Chicago Times in a vein both humorous and instructive. From this time till frost comes, look out for the advent of the lightning-rod man. He will call at the house and enquire for the owner, and is never so happy as when informed that he is absent. This gives him an opportunity to scare the women folks, who are very likely to be "afraid of thunder." He will represent the danger of living in a house that has no lightning-rod attached to be so great that they will not "sleep nights" till one is put up.

Having talked for an hour, he will leave a tract, half of which is devoted to statistics of mortality from lightning, and the other half to the advantages of the celebrated patent, spiral, tubular, double-and-twisted thunder-exterminator. He calls again in a week and expresses his surprise that the house is standing and its occupants are alive. The head of the family is ready for a trade, for he fears that the female member of his household will die of fright if the house be not equipped with a lightning-rod before the next thunder cloud appears. He signs a skillfully-worded contract, by the terms of which he obligates himself to pay so much per foot for a sufficient amount of rod to protect the building he occupies. Of course the lightning-rod man being on expert at the business is constituted sole judge of what length of rod is necessary. He roughly guesses that about fifty feet will be required. The next visit is for the purpose of putting up the celebrated lightning-demolisher and thunder-tamer.

A survey of the house is now made for the purpose of seeing how many feet of rod the signer of the contract can be forced to pay for. You may depend on the lightning-rod man to figure this very fine. He understands how to bend the rod round the eaves of this house, how to carry it to the extreme corner, and how to attach it to the most distant chimney. He is engaged in selling rods by the yard and he has no notion of disposing of a scant pattern. When measured up with all its crooks and turns it is found to be about three times as long as originally supposed. If this was the only swindle connected with the transaction there would be less cause of complaint. But it is not the only one. The rod is generally sold for four or five times as much as it cost.

Most of the claims for the efficiency of the rod, the ability of the point or points to attract lightning, and for its peculiar method of attachment to the building are fraudulent. Some smart fellow got a patent on some peculiar turn or twist in a piece of fragile metal that could not support itself and used it for the purpose of selling an article almost entirely useless.—Every electrician knows that the fewer turns, twists, curves, angles and joints there are about a lightning-rod the better it is for the purpose for which it was designed. The truth of the matter is there has been no essential improvement on the original lightning-rod as brought out by Dr. Franklin. That was a straight continuous bar of wrought iron secured to a building by attachments of wood or metal. It was a very inexpensive and simple contrivance, but it conducted electricity better than most of the new-fangled humbugs that have taken its place.

The cheapest way to procure a good lightning-rod is to buy a bar of round iron three-fourths of an inch in diameter and of the requisite length to reach ten feet above the highest point of the roof, to extend over the roof on the most direct line to the ground and to continue into the earth till permanent moisture is reached. This can be secured to the chimney, the roof and walls of the building, by means of iron staples. The tip of the rod should be cut in the form of a screw so as to fit in a polished point that can be obtained in almost any hardware shop. Sometimes points may be obtained that will fit over the end of the rod. Instead of a round iron bar a strip of iron one inch wide and a fourth of an inch thick, may be used, and in some respects it is superior. This strip may be pierced with holes and tacked directly to the building and chimney, or it may be secured by staples, or by pieces of iron bent over it and secured by screws. Whichever kind of conductor is used, it is advisable to paint it of the same color as the house, so it will not act to disfigure it. The paint will protect it against the action of the air and rain, and will not essentially injure its conducting power.

At present, all persons versed in the laws that regulate the passage of electricity look with disfavor on any attempts to insulate a rod by means of pieces of glass. On the other hand, they advise connecting the rod directly with the building, and particularly with metal eave-spouts or other metal surfaces about the exterior of the building. The old idea that electricity only passes over the surface of a substance is abandoned. It is now accepted as a fact that electricity in motion pervades the entire substance of the object through which it passes. This dispenses with the argument in regard to tapes and ribbons of metals as conductors of electricity. The matter that demands most attention in putting up a lightning-rod is the connection it forms with the earth. This is the thing to which lightning-rod men give the least care, as digging in the hard earth is not the kind of occupation they prefer. It suits their purpose better to sink a crowbar into dry sand and drop the end of the bar into it. The end of rod should reach permanent moisture, or else it should extend into a pit filled with charcoal, coke, or scrap iron, either of which constitute very excellent conductors of electricity.

CROSS BREEDING OF GRAIN.

THE "Report of the Department of Agriculture, for May and June," forms a pamphlet of nearly 100 pages, and is in most respects a very commendable production. The reports on the condition and prospects of the growing crops are quite full and satisfactory; and the statistics and diagrams exhibiting the amount, value and progress of agricultural production in the various States, etc., are highly creditable to the industry and talents of the worthy statistician of the Department, whose laudable aim has evidently been to make this report a Centennial document which American citizens should take pleasure in putting into the hands of visitors from other countries who desire information respecting the resources, productions and progress of this country.

But every intelligent American who reads the article on p. 191 2, written by the Commissioner himself, on "Cross-Breeding of Grain," will blush for the ignorance of the man who occupies such high position; and before handing the Report to any foreign visitor, will tear out the article, which is a disgrace to its author and the Department of which he is the official head.

After a couple of paragraphs, which amount to nothing, on the subject of farmers' changing seed of grain, the Commissioner goes on as follows:

"Another maxim which farmers generally accept as an axiom is, that by sowing wheats of different qualities together, that they will so hybridize as to produce a mixed breed; while even a little observation would teach them the error of this conclusion, and that each grain produces its own like, and that really no hybridization takes place at all, and that the mixture of seed produces the unmitigated evil of mixing wheats which perhaps ripen at different periods, or perhaps require different treatment when they come to be reduced to flour. A little study of the nature of plants would seem to be necessary to a knowledge of their proper treatment during their growth. Of the flowers of plants, some are male and some female. In some the staminate and pistillate flowers occupy different parts of the same plants, as in Indian corn. In the larger number of plants the male and female organs mature at the same time in the same flower; and of these some are subject to self-fertilization, and others to cross-fertilization. Such plants as peas, beans, wheat and barley have the male and female organs within themselves, and are not subject to cross-fertilization, and therefore it is that wheats do not mix their qualities at all by being planted together; and as it is objectionable for other reasons, it should never be done. The leaf or flower which protrudes from the glume of wheat is neither an anther, a pistil, nor a stamen, and neither emits nor receives the fertilizing pollen."

The lack of botanical knowledge betrayed by the foregoing would disgrace a country school boy, fifteen years' old, of the present day. Any person of "even a little observation," who has noticed a field of wheat when in bloom, has seen the anthers hanging outside the spikelets of the heads, and when in right condition, the pollen from these anthers may be seen carried by the breeze, like fine dust, over the field, thus settling upon the heads, and reaching the tips of the little feathery pistils which at such time protrude outside the glumes, for the purpose of fertilization. In this way "cross-breeding" is readily accomplished by natural means, or it can be done easily by art, and has been the means of producing a multitude of different varieties.

Lake County, O. TRITICUM.

The Garden.

AGAIN ABOUT MOLES.

I AM the "subscriber" who asked how to rid my grounds of moles, and was answered in the RURAL of June 24th. I hope that the gentleman who invented the mole trap will yet be rewarded, and the public benefited by its further sale. I noticed in the RURAL last spring a statement in regard to moles which I do not think is correct, at least I am sure it is not entirely so. It was said that the mole was an insectiverous animal. That it subsisted upon grubs &c., and did not disturb plants except to cut a hole through them when they happened to be in its way. At that time, I sent the RURAL a parsnip which a mole had hollowed out, by ascending its interior. I lately found an isolated hill of potatoes in my squash patch, which was dying. The moles had eaten up its roots *entirely*, tubers and all.

Howard Springs, Tenn. L. H. BELL.

REMARKS:—Some of the ways of moles are past finding out. Two and three years ago, our grounds were alive with them. The sod was riddled—borders and cleared plots for flowers resembled maps of mountainous regions and it was found next to impossible to cultivate annuals at all. Castor-oil plants, Cannas, Balsam, Petunias, Snapdragons were so undermined that between resetting and being upset, many were killed and the rest dwarfed and harmed. A weeping Birch was so undermined as to lose its foliage and a Norway Spruce would have died had not their excavations been refilled. We used almost everything (as we then stated) that we knew or could hear of to poison or to drive them away without decided effect and finally, in despair, left them to do their worst. Strange to say, last year we were troubled with them very little and this year not at all. We have never even conjectured why they thus suddenly quit our premises after having given every evidence of an attachment the sincerity of which we were too hopeless to doubt.

But to answer our correspondent:—Through the whole period during which our grounds were infested, we never once had evidence that they eat a plant, root or vegetable fiber. That they seem to select the roots of plants in their runs is true enough—but this may be because they are attracted by the moisture from artificial watering, and the worms that in such moist and rich spots, congregate. That they do not eat such vegetables as parsnips and potatoes, we give as proof the following:

"I caught" says a correspondent of the Tribune "a mole in October, and imprisoned it in a box 12 inches square, slats across the top, with 5 inches earth in the bottom. I put in some slices of potato, turnips, parsnips, carrot and beet and left them three days, but nothing of them was eaten. I then put in some grub worms and some earth worms, which were devoured ravenously, the half-starved mole taking them from my fingers. I then left it two days longer, then put in some corn, which was eaten. I did not go to it again for three or four days, but when I went it was dead. It died rather than eat vegetables."

How does our correspondent know that moles hollowed out the parsnip which he sent to the RURAL? How does he know that moles eat up his potatoes "tubers and all"? Did he see them *in flagrante delicto?* Otherwise we should charge this work to ground mice or even to grubs rather than to moles.

As to the trap. We wrote a letter of inquiry to the inventor and manufacturer, who replied that having many irons in the fire, he was unable to spare the time required to place it in the market. Perhaps it is different now. The trap, a somewhat large, clumsy contrivance would cost not less than five dollars at retail, manufactured in its present shape. But it is very effectual and we should say that the "public would be benefited by its sale" and the inventor "rewarded."

NOTE.—Let it be understood that it is not the present writer but "Daily Rural Life" who owns the trap which with him has proven so effectual; and it is he who is responsible for having raised many hopes (judging from the letters received) destined, as we think he well knew at the time, to be dashed all to pieces.

We have our opinion as to people who enjoy such trifling with the needs of those who help to support them—and our readers will have theirs!

THE CURRANT WORM.—I mean the green worm about half an inch long that feeds on the leaves of the currant only when it can find none of the gooseberry. Having read that the imago hibernates in the earth near the stem of the bush, I plastered early in spring with lime mortar a radius of 6 or 8 inches intending to bury them beyond resurrection. That season I saw but one and none after for three seasons.—P.

Dairy Husbandry.

MANAGEMENT OF MEADOWS IN DAIRY SECTIONS.

Dairymen not unfrequently complain that their meadow lands do not yield satisfactorily for a succession of years—that the grass is inclined to "run out" after being down three or four years, and hence plowing and re-seeding has to be resorted to. It is true there is great difference in soils, some being of a character that will not hold grass permanently or for any considerable length of time under ordinary treatment; but the complaint to which we refer applies particularly to lands in good dairy sections which are well adapted to grass. We may, therefore, refer to some of the causes that operate against the productiveness of meadows, and more especially as some faults in management apply to the season close at hand. In the first place we may remark that many meadows are badly injured in their productiveness and permanence by allowing the grass to mature too far and ripen its seed before cutting. When grass is allowed to become fully ripe before cutting, it makes heavy drafts upon the soil and rapidly impoverishes it if not kept up by frequent applications of manure. The effect upon the land is similar to successive crops of grain, not quite so rapid, perhaps, in its exhaustive effects, but still sure and constant. When grass is cut early and before it has matured, there is less woody fiber, it is more rich in the elements of nutrition, while at the same time it draws less upon the soil. Here is often the first great mistake in the management of meadow lands. Another very prevalent fault, and one following closely upon the heels of the hay harvest, is the pasturing of meadows. In many instances the cows are turned upon meadows before the grass has acquired sufficient growth to shade the roots of the plants, and by allowing the herd to eat down the grass and expose the roots to the hot sun—not unfrequently, too, during drouths—the roots of the plants are burned out and destroyed, more or less, and hence the succeeding crop is lessened. We have seen meadows of timothy, in very dry seasons, nearly destroyed from this treatment, the hungry animals pulling the bulbous roots out of the ground in large quantities. Then, again, meadows are often pastured to excess, and as cold weather comes on, with no growth of leaves to protect the roots, the winter frosts complete the work of destruction, and hence plowing and re-seeding must be resorted to.

Many persons neglect to top-dress and manure meadows under the mistaken notion that grass lands can do very well without it. We are opposed to feeding off of the aftermath of meadows. It should be left to protect the roots of the plants during the hot days of August and September, as well also as a covering blanket for winter. It is much better for the farmer to grow corn fodder for the supply of fall feed than to depend upon the afterfeed of meadows, and in the long run it will be found to be much cheaper. There is many a farmer that would consider the aftermath at ten dollars an acre excessively dear and more than he could afford, and yet we have often seen more than that loss made by feeding off the meadow in fall, and thus reducing the yield of grass the following year. In some instances when the aftermath is very heavy it may be advisable to allow the cows to bite off the tops off the grass and to trample it down late in the season, but it never ought to be eaten down close if a permanent meadow and large yields be expected.

Again, some farmers are accustomed to pasture meadows in spring. This is a very bad practice, and no meadows under such treatment can be expected to yield full crops. There is another fruitful source of poor meadows lying back of all the faults we have named, and which may be mentioned in this connection. We refer to the poverty of the soil at the time of putting down to grass and the imperfect manner of preparing the ground and seeding it. If lands by long cropping and frequent plowing become worn and exhausted of their fertility, and are thus turned to grass without enriching with manures, heavy crops of grass ought not to be expected. And yet this is the condition in which many meadows are put down. The land having been worn out for grain is, as a last resort, thrown into grass, and then if the grass fails to be enduring, the result is attributed to some inexplicable cause. Many meadows that are yielding less than a ton to the acre, and which are said to hold grass poorly and to be "running out," it will be found, owe their trouble to the cause we have named. The land originally was well adapted to grass, but, worn and starved of fertilizing elements, it refuses to yield beyond its capacity. Lands designed for permanent meadows should be put in good heart at the time of seeding, and attention should be paid to a thorough and complete working of the soil, so that it be in fine tilth for the seed bed. If the land has been worn and manures cannot be plentifully supplied at first, frequent top-dressing during the first few years after seeding should be resorted to, and in this way the soil will be recuperated and the grass abundant and enduring. Great losses are annually sustained on account of neglect and improper treatment of meadow lands, and we call the attention of dairymen to the points we have enumerated because they are common faults which demand correction.

CURIOUS PROCESS FOR MAKING CHEESE.

Among the curious methods for the manufacture of *fine cheese*, the process adopted by Mr. Joseph Harrison of Derbyshire, England, will be of interest. The curds are not scalded, no heat being applied after the milk is set for coagulation. The expulsion of the whey, or its separation from the curds before being put in the hoop and under press, is being accomplished by a process quite different from anything known in practice in this country. But what will be surprising, perhaps, to most of our factory cheese makers is the fact that the cheese made under this process is of the finest flavor and quality and sells in the best markets of England for "top prices" on a par with English cheddar, which ranges from twenty to thirty shillings higher than American cheese.

LEADING POINTS IN ITS MANUFACTURE.

The following are the leading points in the process:

The milk, when collected, is set at a temperature of about 80° Fahrenheit, with sufficient rennet to produce thorough coagulation in from forty to sixty minutes. The cheese is made twice a day—that is, from the morning's and evening's milk separately. After coagulation is perfected and when ready for manipulation, the breaker or cutter is passed up and down through the mass until the curds are broken into small lumps about the size of a hazelnut. The operation of the breaking is at intervals of a few minutes. After standing for the whey to form, a pressing plate pierced with holes and fitting the tub is used and pressure applied to the curds. Faucets are arranged in the tubs at different hights, and through these the whey is drawn off as it rises through the holes in the pressure plate. The curds are left under pressure in the tub until in the judgment of the operator it is ready for the next process. This consists in cutting the outer edge of the circular mass of curd into blocks with an implement similar to a mason's trowel. These blocks of curd are piled in the center of the tub and pressure again applied until the whey is sufficiently expelled, when it is crushed up with the hands and put to press. It remains in press five or six days, being turned from time to time and receiving a fresh cloth. Then it is taken out of press and rubbed with salt on the outside every day for a few days, or until it is sufficiently salted. The cheeses are from 3½ to 4 inches thick, and from 15 to 16 inches in diameter, weighing about 30 pounds each.

Such are the general outlines of the improved process for making Derby cheese. The cheese is rich, with a peculiar, clean, sweet flavor, and from its great excellence commands the extreme prices we have named.

It will be seen that the method employed for freeing the curds from whey differs materially from the ordinary practice in this country, and from it we learn the fact that the making of good cheese is not confined to one particular process, but that the same result is reached by very many and diverse methods, and much doubtless is due to the skill and judgment of the maker in all processes.

ANALYSIS OF BUTTER.

Everyone knows that there is a great difference in the richness as well as flavor of butter, but the why and wherefore is not so easily found out. The chemists have taken hold of this subject, and it is possible that we may through their aid have some light thrown into the butyraceous abyss. The following from the Agricultural Gazette is one step in that direction:

A report has been made to the Board of Inland Revenue by the Principal of the Chemical Laboratory, Somerset House, on experiments conducted by him for the analysis of butter. One hundred and seventeen samples were tested, the result being that while a few samples were found to be very poor in quality, and a few others exceptionally rich, the great bulk examined were found to possess considerable uniformity of composition, the principal variations being apparently due to a difference in the method of manufacture, the different seasons of the year when made, and the various modes of feeding. As might be expected, some of the poorest butters were produced by and obtained from small farmers in Ireland, at a time when there was very little grass and food was scarce. It was also noticed that the butter was relatively poorer in its essential constituents when the food was chiefly cotton and oil-cake than was the case when roots and grass formed the staple food. A noticeable feature in the results recorded is the great variation in the quantity of water in the different butters, the lowest being 4.15 per cent. and the highest 20.75 per cent. The Devon and Dorset butters, which usually stand so high in the market, were found to contain in nearly all cases a high percentage of water, and one which was procured from the dairy of a private gentleman contained as much as 16.90 per cent., and a second sample, recently obtained from the same source, contained 15.70 per cent. Another point of interest was in some measure elucidated, and which has reference to the deterioration which certain butters undergo when kept in small quantities in glass or earthenware vessels. It was found that while some of the finest and best prepared butters undergo little or no change, there is in others a gradual disappearance of the characteristic principles of butters, and a consequent assimilation to the constitution of an ordinary animal fat. This change, which appears to be due to an incipient fermentation, and is generally accompanied by the development of fungi, is probably caused either by the use of sour cream or by insufficient care in making butter.

ENGLISH METHOD OF PACKING BUTTER PRINTS FOR MARKET.

The Derbyshire method of sending butter to market is quite different from anything practiced in this country. The dairy farmers put their butter up in half-pound prints neatly stamped. Instead of boxes or pails for packing, they use stout willow baskets. These are made especially for the purpose, and are arranged to receive from 20 to 30 prints in each layer, and several layers of prints are placed one above the other. The layers of prints just fit the basket in rows 5 by 6 or 4 by 5, so as to avoid shocking and bruising by moving from their position as placed in the basket. The baskets are very nicely made, the sides rising up from the bottom perpendicularly, and being made sufficiently strong to retain a true and even shape. From 15 to 30 pounds of butter are packed in each basket, according to the size of the dairy or the amount of butter to be sent to market from time to time. In other words, the baskets are made of different sizes to accommodate the dairy, and they are completely filled with prints when sent to market. The following is the manner of packing:—First, a fine, white, dry cloth is laid over the basket, and upon this is placed a wet one of fine white cotton. They lay dock leaves over the bottom. The dock leaf has a stalk running through its length, thus rendering the back of the leaf uneven, while the face of the leaf is flat. The stalk, therefore, must be carefully drawn off with a knife, care being taken that the leaf is not split. Now wet the prepared leaves and place them in the bottom of the basket, and upon them place a layer of butter prints, then a layer of leaves, and so on until the basket is filled, finishing with a layer of leaves. The ends of the cloths are now turned down over the whole, and it is complete. The basket should hold five half-pound prints in depth. In this way the butter goes to market in the neighboring city or village, sweet, rosy, and in firm condition, the same as it leaves the dairy.

CLAY FOR SANDY MEADOWS.

Can I improve a field when the soil is sandy and washy by adding clay? I wish to make a meadow of it.—J. Ames.

Sandy lands that are yielding poorly may be improved often at little expense by top-dressing with clay. We have seen meadows made to yield largely simply by dressing with a thin coating of clay hauled from an adjacent bank and scattered over the field during winter, where, by the action of frost and the spring rains, the clods were reduced to a condition to be easily broken and further distributed over the surface.

Heavy clay lands are often benefited by dressing with sand or sandy loams. Fields are often located at a short distance from deposits of clay or sand, and may be permanently benefited by top-dressing in the way suggested. Sandy and leachy soils that are not retentive of manures may thus be often so ameliorated as to be made very productive and at comparatively little expense if deposits of clay are near at hand.

A few years ago a farmer living in the valley of the West Canada Creek had a large field of sandy land which was so unproductive as to be considered of little value. The land was plowed in the fall, and during winter the farmer set his teams drawing clay from a bank near the creek and close at hand. In the spring the clay was distributed over the surface as evenly as possible and harrowed in, and the field was then sown with grain and seeded down to grass. A good meadow was thus obtained, which proved productive for a number of years, though only a light coating of manure was applied from time to time, the field getting no better treatment in this respect than other parts of the farm where the soil was stronger and better.

We have no doubt the field referred to would receive benefit by an application of clay, and we should take the risk of making the experiment on a small scale, to say the least; then, if the improvement and cost of adding clay proved satisfactory, a more extensive surface could be treated.

The Herdsman.

MILKING MACHINES.

A writer to the North British Agriculturist writes: Allow me to state that I tried what I believe to be the ordinary milking machine, in a dairy of 55 Ayrshire cows about nine years ago. I first ordered one, and was so well pleased with its apparent efficiency that I at once ordered a few more, and the greater part of the milking was done for about a week with them, when I found out that the yield of milk and weight of curd had been gradually decreasing the time they were in use, so I at once put them aside and resumed hand-milking, when the yield soon increased to what it formerly was. This has been my experience of milking machines, and I consider their failure mainly caused by the total absence of any mechanical action on the teats or milk vessel, and not to the smallness of the tubes, as supposed by Mr. Littlejohn—a very simple defect which, if it existed, could easily be remedied. The young of all mammalia when sucking, by butting with their nose and pulling, bring a considerable amount of mechanical force to bear upon the teats and vessel. For instance, who has not observed a young pig when it could find nothing in the teat butt and rub with its little nose all round about it till it got its reward? In these days of dear labor, when the most indifferent class of dairymaids can scarcely be got either for "love or money," the Highland and Agricultural Society would be doing a duty that would be highly appreciated by all dairy farmers were they to offer a handsome premium to the inventor of a thoroughly efficient milking machine.

EXPERIENCE vs. THEORY.

A correspondent of the Germantown Telegraph in giving advice about building barns recommended putting in many windows, but next week he is informed by Mr. R. Hecker: "that during fly-time stables can hardly be kept too dark, except at feeding time for a few minutes to enable the men to see. A million and more of flies may be in a thoroughly darkened stable yet will not move, hence neither annoy the animals, defile feeding material, nor soil windows. The time will come, for large farms at least, when steam will in summer drive circulation of air by a fanner through the cattle-houses. Not a fly will be seen there and far less disease obtain. There is no doubt that during summer much beef could be and should be made by bullocks comfortably warm, but untormented by flies or excess of sunlight. More milk, butter and cheese likewise will result if cows are shielded from flies and very hot (through too much light) stables. They are machines needing quiet if they are to yield plenty and good milk.

The Horseman.

HORSES PULLING AT THE HALTER.

A horse can pull more backwards by a strap over the top of his head than he can pull forward by the breast and when he has learned this he will break almost any single strap of leather but this is not the worst of it, there is great danger of his injuring himself as well as doing injury to the harness or carriage when loose. There is much less danger of injury by tieing him with a strap around the neck when he cannot or will not exert as much force. A handy way with a carriage horse is to have a strong two inch strap with a strong buckle fastened to an iron ring. This can remain on the horses neck then have in your buggy a new strong rope with a large knot on one end that will not pass through the ring. Draw this through the ring when you tie him and he will try the strength of it but a few times. Such is my experience.

S. B. Peck.

PROTECTING HORSES FROM FLIES.

A French pharmaceutical chemist has discovered a way to protect horses from attacks of flies, according to a London medical paper. His invention consists in rubbing the horses, especially on the part most subject to attack, with a little concentrated oil of laurel. There is not the slightest danger in its use, and the cost is said to be very small. Another repellant suggested by the same person, is a solution of sixty grammes (one pound and five ounces avoirdupois) of assafœtida in two glasses of water, and one of vinegar. If horses be well washed with this, not a fly will settle upon them, as the odor of the assafœtida drives the flies away. This drug has no deleterious qualities as an external application, and may be used unhesitatingly.

Pomological.

THE DECAY OF FRUITS.

At a recent meeting of the *Gesellschaft naturforschenden Freunde zu Berlin*, Dr. Brefeld reported the results of his investigations on the decay of fruits. He says it is a universally recognized fact that a rotten apple will infect a sound one with which it may be in contact. We cannot conceive infection in the absence of an active agent producing it, and calling forth and determining the form of this phenomenon. These investigations embraced the examination of rotten fruits of various kinds from the most widely diverse localities, and at different seasons of the year. The tissue was invariably found to be exhausted and withered, the cells had lost their turgidity, the contents were contracted, and the cell-sap dispersed in the inter-cellular spaces. With certain exceptions, alluded to below, Brefeld found the entire mass of cells permeated in all directions by the easily seen spawn of fungi, but the threads were merely interlaced among the cells, never piercing the cells themselves. The fungi present belong to very common molds of two distinct kinds; one with broad dense tubes without partitions, the other with narrower, frequently septate tubes, both being very much branched.

The former consisted mainly of Mucor stolonifer more rarely of M. racemosus, and the latter of Botrytis cinera and Peuicillium glaucum. There seems to be no doubt that these parasites are nourished by the cell-sap which has escaped into the inter-cellular spaces; but the most important question for elucidation was whether these fungi are the cause of decay, or simply accompanying conditions. To determine this point, several series of experiments were undertaken with the pure fungus and perfectly sound fruit. Spores were thickly sprinkled over sound fruit, and, to make the experiment more conclusive, the spores are conveyed to the fruit in water and the fruit afterwards placed under a bell-glass in a moist atmosphere. As might have been expected, the fruit remained sound, the spores failing to germinate altogether, or germinating only very sparingly. In consequence of the absence of a nourishing fluid, the spores possessed no power to attack the tissues of the fruit.

A second series of experiments was instituted, in which the spores were dipped in a nourishing solution of fruit pulp, in which they could germinate and form a mycelium, and this was laid on sound fruit with a pencil. Soon some of the fruits began to show here and there, in the least protected places, symptoms of decay, spreading with varying degrees of rapidity over the whole fruit. Nothing was easier to observe than that the penetrating fungus was actually the cause of the decay. Another set of experiments more fully proved this to be the case. Some sound apples were artificially wounded, and infected with the spores, which grew and spread in the the same manner. Other sound, bruised, but not infected apples showed no symptoms of decay.

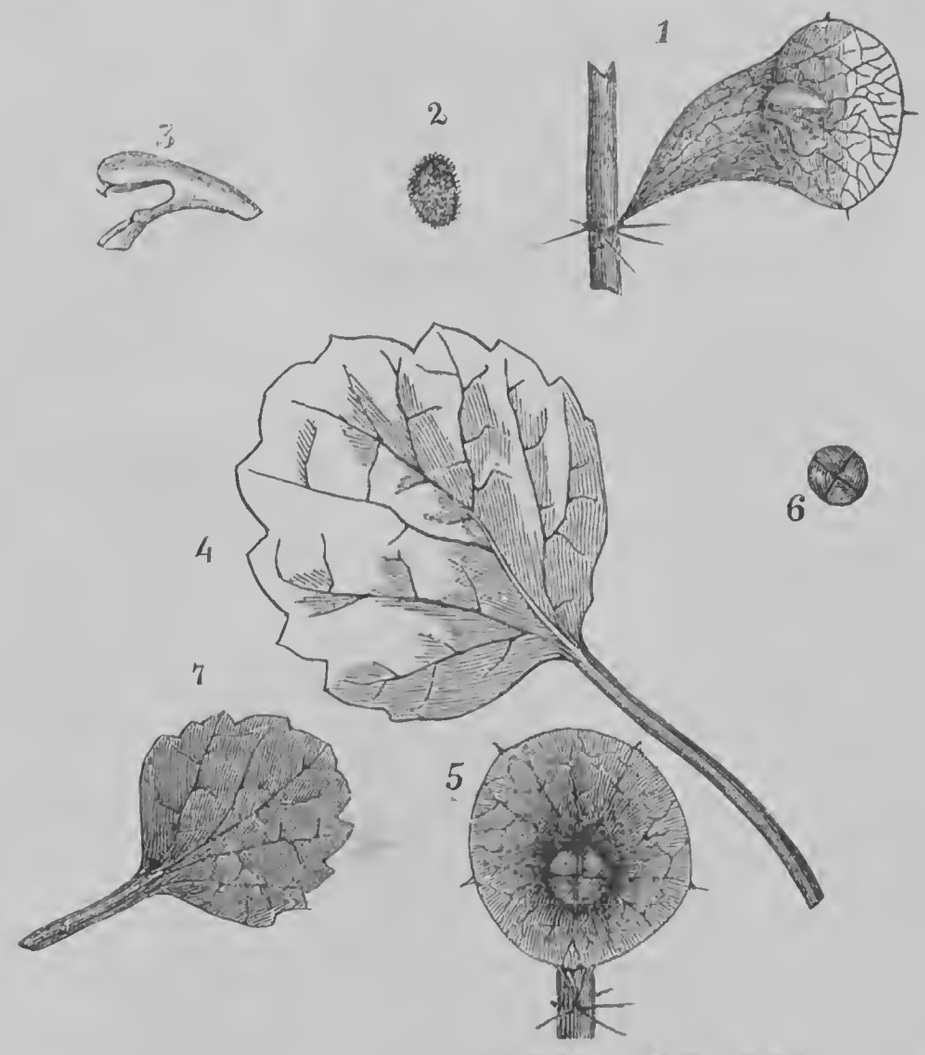
From a large number of experiments it was found that the more unripe the fruit, and the denser its tissue, the less power the fungus had of taking possession of it; but with the increase of saccharine matter, and the decrease of acids, the fruit becomes more susceptible. Unripe fruit artificially infected with fungus did not decay, as the fungus did not find a suitable host. Concerning the relative growth of the fungi named above it was found that Mucor stolonifer was by far the most rapid. Pears infected with the fungus become thoroughly decomposed in a few days, and, strange to say, no outward trace of it is usually discernible before the whole interior is destroyed.

Now arises the question, Do fungi always cause the decay of fruit? This is easily answered in the negative, for many pears, and in a still more striking manner the Medlar, exhibit a kind of spontaneous decay, equally as rapid in its course as is the case where molds are present. This kind of decay is what we find in a "sleepy" pear and a blet medlar, in which, according to Brefele, there is no fungus present. Otherwise the decomposition of the tissue proceeds in exactly the same manner in both cases. The foregoing extracts fully confirm practical experiments, and suggest the means for preventing the spread of these insidious organisms—the molds—in the fruit room.

ALMOND CULTURE IN CALIFORNIA.

Our cousins on the other side of the mountains are becoming quite elated with their success in almond culture and we can only wish them success in this direction.

The San Luis Obispo Tribune has been at some pains to investigate the condition of almond culture in that county. It says:—"A few trees have been planted in almost every yard and orchard, but in no single instance have they been planted in numbers to constitute an orchard. The nearest approach is upon the place of J. P. Andrews, about three quarters of a mile from the court house. Here we find a little cluster of sixteen trees now seven years old. These trees have their third full crop upon the boughs, which is a sight to gladden the heart of man. Mr. Andrews informs us that two years ago, when the trees were but five years old, the



PARTS OF MOLUCCELLA LAEVIS.—(SEE FIRST PAGE.)

gathered crop was one hundred pounds to the tree.

Last year, owing to overbearing the previous year, it was fifty pounds to the tree. This year it is far in excess of two years ago, from the fact the trees are much larger, but we will call the present crop one hundred cents per pound for California soft shells, will give $17.20 as the annual cash returns per tree. With 100 trees to the acre, bearing equally well, we should have a cash return of $1,720.

The cost of production could not in any case exceed twenty per cent. of the product, which deducted, leaves a clear profit of $1,376. This is better than the best orange orchard in the world. It may be urged that we cannot rely upon these returns. All we can judge by is what has been done and here we have three successive crops to base our calculations upon. Those inclined to doubt the profits of this business should go to Mr. Andrews' place before he gathers his crop and judge for themselves. We are willing to cut down the crop to 20 pounds and then we can see ten times the money in almonds that there is in barley, wheat or sheep and with little more labor."

ALMOND CULTURE IN SANTA CLARA VALLEY.

A correspondent of the Rural Press tells his story in regard to the success of almond culture in Santa Clara Valley.

In the southwestern portion of this valley there are several quite extensive orchards of the almond tree, which, so far as I have observed are doing very well. Of these, the orchard on the Spring Brook ranch, near Los Gatos, is the most prominent as to size, location and thorough culture, as far as my observation has extended.

While driving in this neighborhood last week I was so attracted by the beautiful dark green appearance of this plantation, the uniform size of the trees in their straight rows, and the general neatness of the whole place as seen from the road, that I opened the big gate and drove down the avenue through the orchard to the dwelling house, which is pleasantly located about half a mile from the road at the foot of the hills, and near the fine springs that have suggested the name of the ranch. Here under the shade of some fine trees in the yard I had the pleasure of meeting the proprietors of the property Messrs. Gardener and Neff, of Placer county, from whom I received the following information in regard to their almond enterprize:

The orchard, which is of the Languedoc variety of almond, covers an area of

ONE HUNDRED ACRES,

and numbers 20,000 trees. Although only two years old from the nursery last winter, they are so large and well grown as might well surprise anyone who might see them, not acquainted with the wonderful productiveness of our climate and soil. The whole plantation is on gravelly, though level foothill land, and the cultivation has been thorough, not a weed or blade of grass could be seen from the drive. Mr. Neff informed me that their men go through the whole plantation six times a year with the most approved tools for cultivation. By this frequent disturbance of the soil moisture is retained near the surface of the land the whole summer through.

It would seem that a few more years will settle the question as to whether almond culture can be made profitable in this portion of the valley, if indeed there remains any question on the subject. Everything so far looks favorable for the best results. The trees are healthy and grow remarkably well under good cultivation without irrigation, and come into bearing very early, as may be seen by many of these young trees. The proprietors estimate the crop of nuts this year at 10,000 pounds—pretty good for trees less than three years old from the nursery. The only drawback to realizing large crops every year is late spring frosts, but in this locality the probabilities are that no serious trouble will come from this source. There are several other almond and walnut orchards in this neighborhood, which I wish to notice in some future letter.

The Poultry Yard.

KEEPING POULTRY.—No. 2.

I now come to breeds of fowls that require still more room than those named last week. These are Game, Dorking, Hamburgs and Polish fowls. Let it be remembered that I have not advocated keeping any fowls in confinement, but simply stated the breeds that will best endure it. I will also say again, that almost all can be kept within circumscribed limits, but some require a great variety of food and more care than others, and sooner get out of condition.

The breeds last mentioned do well with their liberty, on farm or lawn, and make a brilliant show. What can be more beautiful than a fine lot of Game fowls running at large on a grass-plat, with their neat forms and close, clean feathering, the embodyment of life and vigor. See the brilliant eye and dauntless carriage of the cock, combined with his bright plumage. I will say nothing of the vulgarity connected with some people's ideas of this breed, and hope my readers will think no more than I say.

Of the Dorkings, a sufficient description of the Silver Gray was given in the Rural recently; the same description holds good for the Gray or colored, except color. Much the same for the White, they are smaller than the Colored, and perhaps a little tenderer. In the Hamburg, we have a delightful bird, with its fine, rose comb, widely different plumage—some almost as brilliant as any of the feathered tribe. What can be handsomer than Golden Penciled or Spangled Hamburgs; or the beautiful, delicate Silvers? The peculiar clearness and sprightliness of this breed make them admired by all who appreciate the beautiful. They almost equal the Pheasant in this respect, and are often referred to under this misnomer. As layers, this breed surpasses all others, except the Polish. Perhaps some fanciers may differ with me on this point, but I am only giving my own experience. I found the Polish, while they had full range on a good run, the best layers I ever kept.

Of the Leghorns and Hamburgs there is but little difference, but I think the Hamburgs have the advantage in number but not in size of eggs, all the conditions being the same.

The Polish fowls equal the Hamburgs for beauty in the Silver and Golden kinds, and branch into equally as great a number of varieties, such as white, black, and also black with white top-knots. Contrasted with their horned, coral-like combs, they make a very noble appearance. I saw a trio, a few days ago, owned by a member of the Bergen Co., N. J., Poultry Association, that reminded one of times when brilliant feathering and beauty of form were not always shown in competition with bones, fluffy, intestinal fat, and diminutive combs and tails.

VERMIN AMONG POULTRY.

At this season of the year insects increase rapidly, and it requires a little active vigilance to keep them in check. To exterminate them, it is necessary to understand enough of their nature to go to work so as to make sure of your prey. There are at least two distinct kinds of parasites on fowls, and what will destroy one will not affect the other. One kind lives on the bodies or feathers of the fowls, and is a louse. These may be got rid of by dusting. See that the fowls have dry ashes and sand, to which add flour of sulphur. Some fowls running at large will not use the place assigned to them for dusting, in which case, watch for their favorite dusting hole and put in some sulphur. If confined, supply them in their house or run. I have had fowls that could not be induced to dust in a box. A good way is to have a shallow box and sink it partly in the ground, so that the inside looks a little below the floor level, when they will take to it more readily. A little sulphur in soft food is also good occasionally.

The other parasite that infests the henery is a mite or minute spider. It should never be confounded with the louse, as dusting does not affect it, for it does not live on the fowl, but in cracks and crevices of the house, nests and perches, coming out while the fowls are roosting at night, preying on the fowls and returning to their hiding places. If they are allowed, through neglect, to get too numerous, they then overrun the nests and roosts. There is only one sure remedy for this pest, and that is, fumigation. Stop all the openings of the house as tight as possible. Start a fire in a small charcoal furnace with a few pieces of coal, (this can be done outside). Lay on a good handful of dampened tobacco (cigar makers' refuse stems will do) for the top layer. Put about half a pound of roll-brimstone, broken up; set it in the house; shut up for two or three hours. Whitewash nests, which should be all portable, adding carbolic acid in the wash, and you will make a clean job of it. This should be done twice or more in a year. If fowls are kept where fumigation is not possible, then use crude petroleum, or kerosene. Apply with a brush to all parts of the house.

FEEDING YOUNG POULTRY.

The great secret of raising very large birds of such breeds as are desired for show or premium birds, lies in careful feeding at this season of the year, while the chicks are growing and feathering rapidly. When the weather is very hot and the birds, like most of us, feel a little lazy, they frequently get down in condition, and to prevent this, feed them well with soft, easily-digesting food and they will keep growing wonderfully. Wheat is good food for growing chickens—it makes more bone than corn and gives them a robust constitution. Let them have all they will eat of grain and soft food twice a day, such as boiled rice and a little soaked bread. Such feeding would be too strong for old fowls making them too fat for laying. Always keep plenty of fresh water at hand. The difference between such fed chickens and those that are left to shift for themselves will astonish the negligent breeder.

The same treatment holds good for early broilers; they will come to maturity long before neglected chicks and pay their owners better. This may seem unimportant to some, but let anyone who wants very large fowls try this method and they will be satisfied with the result.

H. Hales.

That Dutiful Son Again.—Recently I described a dutiful son that helped his mother to hatch her second brood of chicks. His mother, after running with her chicks the usual time, made up her mind to dismiss them to *start for themselves*. She commenced at her oldest son first; but he would not stand that sort of treatment and showed fight; they had several battles. His mother finally became so disgusted with his behavior that she deserted him and her family and took lodgings on another part of the farm. The cockerel keeps with the chicks, and at night plays mother as best he can. H. H.

Arboricultural.

THE RHODODENDRON.

A well known genus of evergreen shrubs or trees belonging to the natural order Ericaceae, the Heath family. In floriculture, probably no shrub is more distinguished or has, of late, received more marked attention than the Rhododendron—a plant, so unique and stately in form, with its broadly-lanceolate dark-green foliage fresh at all seasons, fairly enchanting when in the month of June each branch from its scaly bud unfolds a large cluster of beautiful flowers, of the richest colors and most delicate tints and penclings imaginable, a perfect bouquet in form, that is certainly deserving of a place in every collection.

For its absence in so many of our gardens and pleasure grounds, with its beauty and general characteristics so universally recognized, no other reason suggests itself to our mind than the erroneous belief, still prevailing among amateurs and gardeners, of its expensive and difficult culture.

The culture of Rhododendrons, however, is very simple, as much so as that of the Rose. They delight in a cool and somewhat moist soil, any good garden soil thoroughly mixed with well decomposed leaf mold will grow them to perfection. A partial shade is desirable, but by no means necessary. It will prolong the flowering season and add to the freshness of the foliage during hot and dry weather.

The best time for planting is previous to the opening of their leaf buds, but they may be lifted with safety at any time from early spring until late in the autumn. If transplanted during the summer season a cloudy day should be chosen for the operation; the soil for the reception of the plants should be well prepared, the lifting and moving be done with care and when the specimen is safely lodged, with its roots carefully distributed and covered with the fine, fresh soil, the plant should be watered thoroughly so that the soil may settle firmly between the roots—then finish nicely around the stem and cover the whole surface with a mulching of straw, hay or any other coarse cooling material and sprinkle the foliage well and repeatedly over head, for several evenings in succession, should the weather be dry and hot. On approach of cold and freezing weather a covering of the roots with dry leaves, of some six inches in thickness, will prove beneficial. A bed or group of this charming plant, once established, requires no further care than the keeping of the soil free from weeds and an occasional enriching with thoroughly decomposed manure or leaf mold.

On my own grounds I have cultivated for a number of years, the following hardy varieties, with continued success and pleasure: Grandiflorum, light crimson; Everestianum, lilac; Album elegans, white, most delicately tinted; Candidissimum, pure white; Bicolor, dark rose; Delicatissimum, blush and white; Purpureum elegans, purple; Roseum elegans, rose; Celestinum, blush tinted; Azureum, purple; Abraham Lincoln, crimson. W. R. Bergholz.

Huguenot Park, New Rochelle.

A NEW FUNGUS ON THE PINE TREES.

New species of parasitic plants are being discovered as well as new insects, in fact our naturalists need not be idle for the want of novelties to engage their attention. In a late number of the Pacific Rural Press we find the following in reference to a new parasitic plant attacking the Pines of California:

Dr. H. W. Harkness, who is devoting the summer to scientific studies in the eastern counties of the State, has discovered a new fungus on the young pine trees, which promises to harm the trees and of which our readers should be forewarned. In a communication to the San Francisco microscopical society, Dr. Harkness writes as follows: I have to-day forwarded for the society's cabinet a specimen of *Peridermium*, a fungus which is attacking the small pine trees in the vicinity of Colfax, at which point Mr. Moore and myself discovered it on the 26th of May last. On the 20th inst. I again visited the locality for the purpose of noting the changes which had occurred during the interval. The fungus belongs to the genus *Peridermium*, order *Æcidacie*, and appears both on the branches and stems of young trees of the *Pinus Ponderosa*, generally forming a complete circle around the tree, its sporidia appearing as a zone of bright orange yellow. The spores first germinate beneath the cuticle, which it destroys. Owing to the irritation of this presence, an abnormal thickness of the cambium is produced, which, in turn, gives place to an excessive growth of wooly fiber. This process being repeated from time to time, a large bulbous expansion is soon formed, so that, as often as occurs, a stem of but an inch in diameter is enlarged to that of four or five. Above this bulb the further development of the stem is retarded or arrested altogether, its place being supplied by a dense tuft of minute branches.

As no reference to this fungus is found in any of the books at my command, I am inclined to the belief that it is a new variety. Yesterday I received a letter from Prof. W. G. Farlow, of Cambridge, Mass., in which he says: "I send you a specimen of *Peridermium*, which is attacking the *Pinus Ponderosa* of this vicinity. Do you find it in California?" As the specimen

RHODODENDRON CŒRULA GRANDIFLORA.

sent by the Professor agrees in every essential particular with the one sent to the society, it would appear that the fungus is attacking the forests in the Eastern as well as the Western portion of the United States. But one other variety of *Peridermium* is yet known upon this coast, and that is found upon the foliage of the *Pinus Insignis*, growing in the Golden Gate park, San Francisco, in the month of January last. This variety we then identified as *P. Pini*, which so far has not produced any special damage.

In the vicinity of Colfax the fungus appears to be limited to an area of but a few acres in extent. Within that area, however, it is destroying the young growth, and should it become generally disseminated, it bids fair to do great harm to the timber trees of this coast.

CENTENNIAL CORRESPONDENCE.

Centennial Exhibition,
Philadelphia, Pa., Aug. 12, 1876.

The Centennial Committee of the American Dairymen's Association held a meeting to-day at the Butter and Cheese Factory on the grounds. There were present Messrs. Pope, Shull, Lewis, Ward, Harris, Gold, Peters, Hawley, Reall, Caswell and Blanding. The session was not quite as pleasant as an ordinary tea party, but some of the time it was much more lively. The principal topic of conversation was the resignation of Mr. John H. Reall and his character. In justice to the Committee, I must say that, notwithstanding the position heretofore taken by the Rural in relation to this body, a cordial invitation was extended to its representative to be present during the whole proceedings. Mr. Scoville read the official copy of Mr. Reall's resignation, whereupon a motion was made that it be accepted. This opened the ball, and the debate lasted from about 11 A. M. till nearly 3 P. M., with a half-hour's intermission for the purpose of inner refreshment.

Now, whether or not Mr. Reall or his character or his doings have been and now are of sufficient importance to entitle them to the continued volley of abuse and vituperation which they received at the hands of this Committee, is to me an unanswerable conundrum. He has made serious charges against some of the Committee, and says he is able to prove them. He has not only expressed a doubt of their perfect veracity, but has otherwise impugned their personal integrity. Mr. Lewis seemed, by his speeches, to be of the opinion that Mr. Reall was not worthy of such attentions as he was receiving, and then proceeded to give him about a half an hour of solid, round abuse, during which he took occasion to hint in the broadest terms that his word was of less value than his bond, if such a thing were possible. Calling the Scriptures to his aid in quotation, as usual, he held up poor Reall in no enviable light. Scoville was extremely anxious to have a committee appointed for the purpose of reporting that Reall was a bad man and Scoville was a good man. In this he was joined by Mr. Hawley, who for once did not say anything about salt. Peters seemed to want an investigation to expose anything wrong if such could be found. Mr. Pope took the same position, and so did Mr. Gold. There seemed to be several present who did not. Scoville and Hawley tried very hard to get Mr. Caswell to say that the Dairy Building was all that could be desired; but Caswell, who cared nothing for the internal fight of the Committee, would not say anything of the kind. He *did* say that he was satisfied, so far as he was concerned, with everything except that, being the only exhibitor of any account, he did not like the idea of coming so far from home to compete with himself alone.

The larger part of the session was occupied in abuse by the Committee of Mr. Reall, and by Reall of the Committee. I have seen a boys' debating club during my school days behave with much more dignity than did these sapient representatives of the dairy interest of this great country. But everybody finally came to be tired out, and the question upon the acceptance of the resignation was put and the acceptance passed. A set of resolutions telling what an excellent building they had erected and what fine fellows they themselves were was then passed with no debate, and the wise Committee dissolved their session perfectly satisfied with the expression they had given of their own opinion of themselves. Taken in connection with the previous acts of this ponderous body of representative men, I suppose it was the best they could do under the circumstances.

So far as I was able to see, the whole day's work (?) showed absolutely no practical solid result, was undignified in the extreme, was in the worst possible taste and fully justified the position taken by the Rural in relation to this whole Centennial Dairy affair. The only redeeming action which I could discover in these proceedings was the open-handed courtesy extended to the press upon the suggestion of Harris Lewis and, had this movement been headed by anyone else, I might say in this connection that I feel bound to "give the Devil his due," but of course I don't desire to steal Lewis' thunder in the way of quotation. Reall made a very weak fight; but the odds were heavily against him. There was Pope with the history of this whole matter at his tongue's end; Hawley, who can wake up in the middle of the night and talk against time; Lewis, who has the Scriptures at his back; Shull, who has great capacity for looking wise; Scoville, who evidently means some day to be President of the United States or Emperor of all the Russias; Peters, who smiles so luxuriously; Ward who, like his namesake, is so very funny; Mr. Gold, who is thoroughly in earnest and Blanding, whose tongue seems to be quite as sharp as his wits if not sharper.

During my wanderings yesterday for items of interest, I stumbled upon one very excellent one. Through the united working of Dr. Kennedy, Capt. Landreth and the State managers of New Jersey, the latter State is to set apart a certain day (I believe the 24th of this month) for visiting the Exhibition. Arrangements have been made with all the railroads for reduced fare from all parts of the State to Philadelphia. The Governor and other State officials are to be present. Speeches to be made, collations to be disposed of and a general jollification is to be the rule. This is to be called the New Jersey Centennial Day and will doubtless be the means of permitting many people to visit the Exhibition who would not, under ordinary circumstances, feel able to bear the expense. This is a very excellent idea and should be adopted in every State in the Union. Little trouble would be experienced in getting the reduction of fares over the various roads for a concerted movement like this and many poor people would be vastly benefitted by the visit.

It is said that Col. Clay, the efficient commander of the Centennial Guard, is about to resign to accept an appointment under the N. Y. State Government and will be succeeded by Capt. Hodges, whose quarters are now in the Main Building. The important part in the Exhibition borne by this body of men fully warrants the appointment of so worthy an officer as Capt. Hodges has shown himself to be.

Short-horn

Sheep Husbandry.

LANGUAGE OF ANIMALS.

The acuteness of the sheep's ear, it is said, surpasses all things in nature that I know of. The ewe will distinguish her own lamb's bleat among a thousand, all bleating at the same time, and making a noise a thousand times louder than the singing of psalms at a Cameronian sacrament in the fields, where thousands are congregated—and that is no joke either. Besides, the distinguishment of voice is perfectly reciprocal between the ewe and lamb, who, amid the deafening sound, run to meet one another.

There are few things which have ever amused me more than a sheep shearing, and then the sport continues the whole day. We put the flock into the fold, set out all the lambs to the hill, and then send the ewes to them as they are shorn. The moment that a lamb hears its dam's voice it rushes from the crowd to meet her, but instead of finding the rough, well-clad, comfortable mamma which it left an hour or few hours ago, it meets a poor, naked, shriveling—a most deplorable-looking creature.

It wheels about, and uttering a loud, tremulous bleat of perfect despair, flies from the frightful vision. The mother's voice arrests his flight—it returns—flies, and returns again generally for ten or a dozen times, before the reconciliation is perfect.

NEW METHOD OF CLEANING WOOL.

Les Mondes describes M. Paulines' new method of cleaning wool for which such important advantages are claimed. According to this, a current of air of thirty or forty degrees temperature is passed through the raw wool, followed by a current of hydrochloric acid gas, previously dried and cooled. In this way the wool is not affected, but any vegetable substances adhering to it are speedily and entirely decomposed. After this has been effected, a current of air is passed through to dispel the hydrochloric acid gas and the temperature is gradually raised to one hundred and thirty degrees, to complete the destruction of the various vegetable matters. This being done, a current of air charged with ammoniacal vapor is then passed through, in order to get rid completely of any remaining traces of hydrochloric acid, and the operation is completed.

Salt for Sheep.—Salt is the very best curative for parasitic diseases among sheep, and it also answers every purpose as a preventive.

The Centennial.

CONCERNING FARM WAGONS.

North-east of Agricultural Hall stands a rude wooden structure, hastily constructed, for the accommodation of farm and other wagons which could not be accommodated in the carriage annex.

It is unfortunate that many special exhibits should have fared so badly at the hands of the Centennial Commission. Surely the wagon industry is no inferior in importance to that of carriage manufactures, yet the annex designed for this special display near the Main Building was quickly appropriated by those who catered to luxurious rather than practical needs, and valuable space, that might have been better used, is occupied by flash drawing-room cars and street vehicles of the same class, that do not, I think, come appropriately under the head of carriages. The addendum mentioned above, to accommodate the overflow of exhibits, was built when all the most commanding positions had been secured, and the result is a structure that stands completely out of the line of travel, and could easily be mistaken for cattle sheds or some other inferior object.

The visitors attracted there are, as one may well believe, not as the locusts for number, and on the occasion of my visit, the sole occupants of the annex were the janitor, a small dog, a Dutch shoemaker, who said he was not interested in wagons, a policeman and the reporter. We were not, therefore, uncomfortably crowded. Many would-have-been exhibitors learning the facts, declined sending their wagons, which had been constructed at heavy expense. Who would go to large expense, where the product of such labor is placed under a shed that is rarely visited? Some, especially Kansas makers, have taken advantage of the State display to put their wagons in their State buildings, where they are observed and criticised by thousands.

Some makers have, however, arisen superior to the instincts of trade and sent forward their products, which, by the excellence of their construction and appearance, serve to lighten up the effect of the otherwise forlorn shed. It occurred to me to inquire into this matter, and learn, if possible, why this interest, which turns out yearly hundreds of thousands of wagons and employs a capital of millions, should have been thus neglected.

It seems that Mr. Pettis, who had charge of the carriage annex, found he could not accommodate the numerous entries and turned the surplus over to Mr. Landreth, Chief of the Bureau of Agriculture. Mr. L. found he had a white elephant on his hands, as there was no space, positively, in Agricultural Hall where they could be accommodated. The only thing to be done, then, was to build a shed and put them under some sort of cover. What was anybody's business was nobody's business, and though Mr. Landreth is free of all blame, the same may not be said of Mr. Pettis or his superiors. No signboards or other direction serve to show visitors where this exhibit may be found, and the official catalogue, even, does not mention its existence.

And this is a specimen of the way many industries, important to the agriculturist, have been managed! It's a great Fair, but is it fair?

Young Rural.

CENTURY BLOSSOMS.

[OFFICIAL.]

To Editor of Rural New-Yorker.—Sir: The Transportion Companies, under the standing arrangements with the Centennial Commission, will return free, from the International Stock Yard to point of original shipment, all stock upon which full freight was paid in the first instance. A circular will be issued in a few days by the Bureau of Transportation, giving detailed instructions upon the manner of shipping stock to the Exhibition. The prizes offered for competition by the Commission consists of four objects—the three latter being given to each exhibitor of meritorious animals.

First. General reports upon breeds, reference being had to animals exhibited of superlative merit.

Second. Special reports upon all animals of high typical development, under the original classification as to breed, age and sex, both as applied to single animals and herds and flocks.

Third and Fourth. Diploma and Bronze Medal of the United States Centennial Commission. The Diploma and Medal will be the same to all who are fortunate enough to receive them; but the Special Reports will differ according to merit, and will be highly valuable to breeders—more so, indeed, than any prize of money or plate, as that can be lost or stolen, and at best can only be seen by a limited few, while the Report can be used without limitation.

The entries made up to the 20th of August will be incorporated in the Official Live Stock Catalogue. The entry books will, however, remain open after then and up almost to the opening day of each serial show—the disadvantage of late entry resting upon the exhibitor in not securing place in the catalogue.

All animals occupying stalls assigned them can, though of late entry, be brought before the Judges for competition, examination and report.

Canada will show 600 head of horses, cattle, sheep and swine, 150 of each group, and they are carefully selected by a special committee appointed by the Canadian Commission. English exhibitors will show over 100 head, under the auspices of the English Commission, and English-bred stock consigned to American agents will more than treble that number. One American agent has entered one shipment of 146 sheep, the consignment of three breeders of high reputation. Among the lot are included the prize ews, and a greater part of the prize rams of Cotswold at the late Royal Agricultural Show. It behooves Americans to be upon their guard, else the award will go over the border, if not over the sea. Burnet Landreth, Chief of Bureau.

Philadelphia, Aug. 5th.

A. T. Goshorn, Director-General U. S. Centennial Commission.—Sir: Since our last report the following pomological and vegetable products have been placed on exhibition:—On July 14, a series of seedling peaches by H. M. Engle of Marietta, Pa. These were called Downing Seedling No. 11, Saunders, Musser Seedling and Wilder. They were said to ripen in the order named—the Wilder being not quite ripe, though the largest and finest-looking fruit. They are all of excellent flavor, very juicy, slightly clinging to the stone, and are as large as the average of early peaches. The flavor of the Musser was particularly good. The Hale's Early has hitherto been our best early peach. Some of these were exhibited from the same orchard, and were not grown to half their mature size. We regard these new varieties as especially worthy of commendation.

Dr. Chas. Seidhoff, Hoboken, N. J., exhibits several plates of currants and English gooseberries, grown by grafting these varieties on the American Missouri Currant. It is claimed that they will not mildew when grown on this stock, and if so, the employment of this stock will be of immense advantage to the fruit growers of America, as the English gooseberry can only in a few instances be successfully grown on its own roots. This is, however, but the second season of this trial in the United States. We can only say that as exhibited before us the fruit was entirely free from mildew and of very superior quality, and the idea seems to warrant a favorable report from us.

W. Dunn Rogers of Moorestown, N. J., exhibits a plate of handsome-looking potatoes called "Lawton."

Dr. W. H. Morague of Palatka, Fla., very large oranges grown in Florida; an enormous citron, measuring 10 by 8 inches; pomegranates; and a grape named the "St. Augustine," approaching the old Elsinbury, but superior in the size of bunch and flavor. Also Orange Flower Water and Orange Wine. The former we regard as of extra fine quality, and the last as an agreeable desert wine of a full orange flavor, and both articles worthy of a special commendation.

On July 20th, Mr. J. S. Collins, Moorestown, N. J., some superior Wilson's Early Blackberry.

Mr. Mexer of Bridgeville, Del., the Wild Goose Plum. This is an improvement on the Wild Chickasaw—much superior to the wild original. This particular one was oblate in form, and nearly approaching the finer foreign varieties in flavor. This variety is unnamed.

A plate of raspberries from D. Liebeig of Green Springs. Belle de Fontenay Raspberry, from P. Stackhouse, Milestown, Penn. On account of a great tendency to produce suckers, and the plants thus crowding out one another, this variety but seldom produces good crops. These berries were unusually fine, and of a delightful flavor.

The Fruit Growers' Society of Ontario make a remarkably fine exhibit, chiefly of currants and gooseberries. Of gooseberries there were 45 plates; 31 of currants; one of Indian Cherry (Amelanchier botryapium). The gooseberries were largely of the European race, showing how well, in comparison with the United States, Canada is suited to this class. There were, however, many dishes of American varieties, notably: Houghton, Downing and American cluster, and these rather larger than are usually grown on the continent of America. Among these were some plates of the original "American Gooseberry," *Ribes rotundifolia*, showing how surprisingly the American race has been improved.

The currants were above the average of American-grown currants in size, the black varieties especially. One plate had berries three-quarters of an inch in diameter.

The raspberries had all spoiled by their long journey, except one plate of Arnold's Seedling No. 7, and this was somewhat decayed. So far as we could judge, we incline to regard it as a variety of high promise. It is represented to have been, in the first place, a cross between the common White Cap and some Red variety, and this again crossed with the Hornet, giving this seedling as the result. We wish to make honorable mention of this superior collection.

W. L. Schaffer, A. W. Harrison, Josiah Hoopes, Thomas Meehan, Judges of Special Pomological products.

A. T. Goshorn, Director-General U. S. Centennial Commission.—Sir: During the past week the Fruit Growers' Society of Ontario have added to their already admirable collection 13 plates of raspberries, 37 of currants, 15 of gooseberries, 14 of cherries, 4 of apples. The whole is, by far, the best exhibit of small fruits made so far, and, when the superior quality of many of the products is considered, deserves the highest commendation.

Mr. Seth Snelling of Milwaukee, Oregon, exhibits two seedling cherries, one he calls "Black Republican," but which is already known to cultivators as the "Luelling." It is a very handsome fruit, dark black, of good flavor—64 of them weighing one pound. The other, "Royal Ann," has been before the Judges earlier in the season. These were much larger, measuring one and a half inches long by one inch in diameter, and 48 to the pound. Their beautiful appearance attracted much attention from visitors, and deservedly so.

Messrs. Kuhn & Co., Rochester, N. Y., made a display wholly of American gooseberries, showing the improvements made in this native fruit. The Houghton Seedling is still the best flavored, though the earliest of the improved kinds. The later ones, Downing Mountain Seedling and Smith's Improved, are all larger in size, and approach, in this respect, some of the foreign kinds, though all are inferior to them in flavor. The exhibit is instructive, and, as such, commendable.

The first apples of this season's growth exhibited in a mature condition are from W. W. Dillard, Fort Scott, Kansas, grown by Joel Teague of Barton Co., Kansas. They are Red Astrachan, 21 weighing 11 pounds, which is about the average of first-class specimens of this variety. The flavor, also, is equal to the best specimens of the same variety grown in other States.

From the same exhibitor are specimens of onions, weighing about 11 oz. each. Coming so far and in such excellent condition, and in advance of other exhibitions of apples, the Judges especially commend them.

W. L. Schaffer, A. W. Harrison, Josiah Hoopes, Thos. Meehan.

The Bench (dog) show at the Centennial is in a forward state of preparation. Three hundred entries have been made, and the number increases daily. Those intending to send dogs should do so on or before Aug. 20, at which time the entries close.

Mr. James Geddes has taken charge of the Stock exhibit, and thanks to his energy, the prospects for a good display are assured.

The Naturalist.

THE GROUND MOLE.

Why invent traps to kill them? They eat nothing but insects, so says the highest authority.

We care not whether high or low "authorities," declare that ground moles eat *nothing* but "insects," the assertion is simply false, and any man who possesses skill enough to catch a live mole can prove it to be so. Without at this time going into any argument on this mooted question, we will simply state one fact easily determined by our highest authorities or any body else and that is, the ground mole will devour earth or angle worms when in confinement or at liberty, and these worms are *not insects*. Furthermore, this *worm, Lumbricus terrestris*, is the mole's principal animal food, if our own personal observation has not led us far astray. But leaving the food out of the question, a vigorous ground mole will lift up and kill a row of plants in far less time than a thousand of our most noxious insects, not excepting grasshoppers and potato beetles. It is to be feared that our "authorities" who talk so glibly about the "useful mole," know little of cultivating gardens infested with these pests. One season of gardening with a dozen moles per acre, would satisfy them to dispense with these secret subterranean assistants.

ONE FOX OUTWITTED.

The Giant's Causeway, says the Derry (Ireland) Standard, a few days since was the scene of a combat of the most extraordinary nature. Some carrion had been deposited on the rocks near the sea, and a fox, evidently with the intention of making a meal of one or two ravens, which had been attracted to the spot by the putrid meat, curled himself up apparently asleep, close to the carrion. The ravens, however, regarded him with suspicion for some time, and finding that Reynard was not likely to sheer off, and probably, unable longer to withstand the effects of what to them was a grateful and seductive aroma, they, by their threatening attitudes, left little doubt in the minds of the numerous spectators that they intended to bring matters to an issue. The two ravens eventually advanced, and one of them took his stand at Reynard's head and the other at his tail. The latter led the attack by assaulting Reynards brush, the other immediately afterward following suit by a powerful tap on the head. Reynard feigned indifference to these polite attentions during a few rounds, trusting no doubt, that his persecutors would become emboldened and indiscreet, and at the same time place themselves within his reach.

Indiscretion, however, is not a prominen characteristic of the *corvus* family, and, after a few more applications alternately on the head and tail, the position became uncomfortable, and the fox began to show fight; but the ravens followed up the assault, first snapping at one end, then the other. It is stated that the warfare was carried on for more than two hours in this way, and, on the whole the balance was against the fox, which, in the words of our contemporary, "was much draggled and weakened but became more reckless as the fight waxed hotter. At this juncture they had worked or fought up to the edge of the rock on which the carrion had been deposited. The raven at the enemy's tail again tickled him, and after doing so the one at the head gave him a fearful pinch, upon which the fox turned upon him in great fury. The one at the tail again performed, and during the passage of the fox after the other raven, gave him a sound outward thud, accelerating his speed so much that he lost his balance and tumbled headlong into the water, amid the plaudits of the spectators and the exulting croaks of the ravens."

ABOUT SPARROWS.

The North British Agriculturist is strongly in favor of sparrows and speaks thus in praise of these little birds:

How much longer will there be sparrow clubs and sparrow prizes? They must be the result of want of observation. A new light broke in upon my bailiff yesterday as he saw flights of sparrows busily engaged on our field of green peas, appropriating the "louse" which was injuring the plant and stopping its growth. I am a great believer in birds and poultry as farmers' friends and this belief has been produced, not only by reading the opinions and facts of others, but from 30 years of close observation of their habits. My gardener was an inveterate enemy to birds, and destroyed their nests in my shrubbery, and in consequence there was always a complaint of grub and other destructive insects; but, when I put a firm veto against the destruction, my garden was well filled with uninjured produce. In fact, if you have grub and insect in your garden, stock it with birds or poultry, and you will no longer complain. In very dry weather, when worms and insects are scarce, you must protect your fruit. Just now I see lots of my poultry among the young mangold or the tares, "appropriating" my enemies. But I have so often said that my best corn crops are within 50 feet of the fowl-house, where the crops from the day of their sowing until harvest undergo poultry examination, that I will not again trouble your readers with details. One must have confidence with only a bushel an acre of seed wheat at their mercy. Let me warn those who do away with all their hedges that there should be belts or shrubberies, not only as breeding places for birds, but also as shelter from strong prevailing winds.

TOASTING A GORILLA.

The scientists of Hamburgh seem to be inclined to indorse and keep alive Darwin's philosophy on the "Descent of Man," from some race of monkeys. They sent to Africa for a live gorilla which lately arrived in good health, and doubtless in possession of all his original native talents. But now a correspondent of Land and Water, writing from Hamburg, has given some further details of the appearance at that place of this youthful specimen of the "man of the woods" on his way to Berlin. Although Mr. Pongo (as he is called) lived on vegetables only in his wild state, he has now acquired a taste for cooked animal food. He has already conformed sufficiently to the rules of European civilization to partake of everything that the bill of fare of a well-appointed table on board steamer or a hotel contains. The grim humor of the Hamburg scientists in respect to their visitor is peculiar. At a social meeting of the Geographical Society of the town, held a short time ago, and at which the members of the Loango expedition—Dr. Falkenstein, Dr. Pechuel-Loesche, Soyaux, and Lindner—as well as Master Mr. Pongo were present as guests, the health of the latter was proposed by the Secretary of the Society, and drank with all honors by those present, it being probably "the first time that a gorilla was toasted by his descendants," says the writer. Dr. Falkenstein returned thanks on behalf of the hon. member of the "Afri an Society." Verily the Berlin and Hamburg philosophers are amusing people.

Domestic Economy.

MEALY AND WAXY POTATOES.

An examination of the potato with a microscope has proved the relative worth of the mealy and waxy kinds of this useful vegetable. On examining a thin slice, it is seen to be almost entirely composed of cells, which are sometimes filled with, and sometimes contain clusters of beautiful little oval grains. The grains remain unchanged in cold water; but when it is warmed they dissolve in it, and the whole becomes a jelly, and occupies a larger space than it did in the form of grains. When a potato is boiled, then each of these cells of which it is composed becomes a little vessel full of jelly; and, if there be not a great quantity of starch in the cells, it may be gelatinized without bursting them. But, if the number of grains or their size be very great, the cells of the potato are broken on all sides by the expansion of the little masses of jelly, and the appearance of mealiness is produced. Hence we see that mealy potatoes are the most valuable and waxiness denotes a deficiency of starch or nourishing matter.

BOILING VEGETABLES.

When peas, beans and other legumes, do not boil easily, it has been imputed to the coolness of the season or to the rains. This popular notion is, however, erroneous. The difficulty of boiling the vegetables soft arises from their imbibing a superabundant quantity of gypsum during their growth. To correct this, throw a small quantity of sub-carbonate of soda into the pot along with the vegetables, the carbonic acid of which will seize upon the lime in the gypsum, and free the legumes from its influence.

ORIGINAL RECIPES.

Boiled Pickled Cabbage.—Wash the cabbage thoroughly, cut the heads into quarters, boil in salted water until tender; stick whole cloves scattering over each quarter, then put them down in layers in a jar or tub, add a few red pepper pods, cover with good cider vinegar. The boiling before pickling is a decided improvement upon the usual way of pickling raw cabbage at least, so says a friend, who ate it at my table over twenty years ago. Mrs. Rustic.

SELECTED RECIPES.

Pickled Onions.—Boil small onions after they are peeled until they are half cooked in salted water; then, while hot, drop them into jars or bottles of spiced vinegar.

Tomato Catsup.—One bushel of ripe tomatoes, wash thoroughly, then boil until soft. Squeeze through a sieve, add one quart of vinegar, half a pint of salt, one ounce cloves, one of allspice, half an ounce of cayenne pepper, two ounces mustard seed, boil the whole three hours.

Sweet Pickled Cucumbers.—Pare and cut in quarters, ripe cucumbers. Remove the seeds; then to one quart of vinegar put three pounds of sugar, and spices to suit the taste. Scald the vinegar and spices together, pack the cucumbers in a jar and pour the vinegar over them boiling hot.

Another.—One-half peck of tomatoes, two tablespoonfuls each of salt and pepper, half a tablespoonful each of ground mustard, allspice, cloves; one pint of vinegar. The tomatoes must be cooked until soft and put through a sieve. Then add the other ingredients and cook until it thickens, then put it in bottles and seal.

Still Another.—To make one-half gallon: One gallon of skimmed tomatoes, two tablespoonfuls of salt, three tablespoonfuls of mustard, one-half tablespoonful of cloves, one tablespoonful of allspice, one single handful of horseradish, and one quart of sharp vinegar; stew four or five hours; then strain, bottle and seal closely. The removal of the seeds is entirely optional.

Pickled Cauliflower.—Break off the flowers, put a layer of them in a jar and sprinkle salt plentifully over them; then another layer of the cauliflowers; then salt and so on. Let them remain twenty-four hours, then wash off the salt and drain dry, pack them in a jar and pour spiced vinegar boiling hot, over them. In four or five days heat the vinegar again and pour boiling hot over them.

Spiced Tomatoes.—Take a bushel of ripe tomatoes, skin and boil them well, then add a teacup of salt, two tablespoonfuls of black pepper, one tablespoonful of cayenne pepper, an ounce each of ground mace, clover, allspice, and cinnamon if agreeable to the taste, mix well. Put the tomatoes in jars and when cold, run mutton suet over them, and tie strong paper over the tops; or better put them in air-tight jars of glass.

Pickled Tomatoes.—Take tomatoes before they are thoroughly ripe. Mix in a stone jar an ounce of mustard, half an ounce each of cloves, allspice, pepper and nutmeg; with half a jar of good cider vinegar. Lay in the tomatoes with a dozen peeled onions of medium size, cover close. They will be fit for use in a month. The onions may be omitted if not agreeable to the taste. Half a pound of sugar added to the vinegar is an improvement.

Another.—Chop fine a peck of green tomatoes, mix in a teacup of salt, let them stand twenty-four hours; then put them in a colander with a heavy weight on top for an hour, or until the brine is all pressed out, spice to taste with cloves, cinnamon, allspice and pepper, mix in a liberal allowance of white mustard seed, pack down in a jar, and cover with hot vinegar in which has been dissolved one teacup of sugar. They will be fit for use in a few days.

Hygienic Information.

POISONOUS PAPER.

Eds. Rural.—Perhaps it will be a benefit to some of your readers to call their attention to this subject. The Health Commissioners of the State of Michigan in their Reports for 1873 4, call the attention of the public to the poisonous colors in wall-papers, especially the bright green, though not confined to that color, as containing arsenic in various quantities from 1 to 6 grains to the square foot; and many cases are given of the bad and sometimes fatal effects of sleeping in rooms the walls of which are covered with such paper. The Commissioners have placed in the principal libraries of the State bound books containing nearly one hundred specimens of different samples of this poisonous paper, in many of which no green can be detected.

As for myself, I ever have had a horror of wall-paper, not suspecting, however, that there was poison in the color, but suspecting and believing that the mold and decomposition of the paste used was unhealthy. Some three years since, I was taken, by slow degrees, with a dull and disagreeable feeling in the head, with a throbbing pulse, which continued for more than two years, being more in winter than summer, and worse at night than during the day. As the trouble in the head was one of the symptoms described in the report mentioned, I might have thought of arsenical paper, but we had neither wall nor curtain paper in the house, and nothing green, as we thought, (ourselves excepted) but old paper boxes in the attic. So we looked for other causes, and the Dr. thought it might end in hypertrophy of the heart. From an article in a newspaper, relating similar symptoms produced by the use of a green lamp-shade, then was brought to my mind, what had not occurred to it before, that I had used an arsenical lamp-shade from a few minutes to as many hours per night for several years. The shade suddenly and the bad symptoms more deliberately disappeared and the hypertrophic symptoms no longer existed. S. B. Peck.

HINTS ON DISINFECTANTS.

The following timely hints on disinfectants from the Boston Journal of Chemistry should be heeded by housekeepers:

If household drainage were always what it ought to be, we should have small need of disinfectants, but, unfortunately, defective drains are the rule and faultless ones the rare exception. In cold weather the former may not in all cases prove seriously mischievous, but with the advent of the dog-days they are almost certain to become dangerous to health. The seeds of disease and death which may remain dormant in winter spring up into rank growth and bear their baleful fruit under the fostering heat of summer. If the cause of the evil cannot be immediately removed—and often it cannot be—the next best thing is to neutralize it by means of disinfectants. If the poisonous growth cannot be rooted up, its fatal fruitage may be blasted in the bud. The drain that cannot be rebuilt or repaired until a more favorable season, may be rendered inoffensive and innocuous by the free use of cheap but potent disinfectants, like carbolic acid and its compounds. A few dollars invested in these may save hundreds of dollars in doctor's bills, or inestimable loss in health and life. No household should be without a supply of them in hot weather, for even where the drainage is supposed to be perfect, it is well to be prepared for the contingency of some unforeseen defect or disarrangement.

Those of our friends who go to the country or seaside for a summer vacation, will do well to bear in mind the peculiar perils of such places. Of late years, the close of the traveling season has brought its reports of typhoid and other epidemics from not a few of the watering-places and summer resorts. Pestilential drains and poisoned wells have spoiled all the "sweet influences" of pure mountain air or bracing ocean breezes. Forewarned is forearmed, and all who leave home for country or sea-shore should think of these things at the start. It may save them many painful reflections after their return. Do not go to a place where the drainage and other sanitary arrangements are not unexceptionable; or, if you cannot be sure on that point, see that there is a good supply of disinfectants on the premises, even if you have to furnish it yourself. A few bottles of the saturated solution of carbolic acid will be no costly or heavy addition to your luggage, and they may save the health of a whole household. The epidemics that have prevailed in country boarding-houses and hotels might often have been prevented by such forethought on the part of a single inmate.

After all the discussion of the comparative merits of disinfecting agents, and the many "powders" and "fluids" that have been patented and advertised, carbolic acid and its compounds, like carbolate of lime, which were among the first to be recognized as really safe, effective, and cheap agents for the purpose, still retain that well-earned reputation; or rather they have gained steadily in favor, while many of their vaunted rivals have passed into merited oblivion. When they have failed to give complete satisfaction, it has been because a poor or sophisticated preparation, with more odor than disinfecting power, has been used. A genuine article from a trustworthy manufacturer has never disappointed those who have tested it.

EFFECT OF MEDICINE ON THE TEEEH.

Dr. J. E. P. Hodson calls attention in the New York Medical Record to the fact that in any illness involving a feverish condition, the fluids of the mouth are constantly as intensely acid, as respects the teeth, as in any medicine administered by the physician; and, moreover, from the high temperature of the buccal cavity at such times, the power of these acids for evil is greatly augmented. Further, a direct consequence of these conditions is the especially rapid fermentation and decomposition of all food lodged between and around the teeth, and the consequent elimination of other deleterious acids, "all forming a mighty power, under which it is not surprising that tooth-structure should melt away like dew before the sun. It is indeed a very surprising thing that any tooth should live to tell the tale."

Dr. Hodson asks, therefore, a little attention to this matter, and recommends rinsing the mouth with liquor calcis, diluted according to the sensitiveness of the mucus membrane, and flavored with a few drops of winter-green or peppermint to make it agreeable; or to rub creta prep. freely about and between the teeth, and allow it to remain during the night; or, if the patient be able to use the tooth-brush, to add a small quantity of sodæ bicarb. to the usual tooth-powder (for this purpose only, and not for general use); or, in short, the employment of any of the manifold methods of neutralizing the acid condition which may be most accessible at the time.

He says that the tube through which acid remedies are usually directed to be taken does not prevent them from regurgitating upon the teeth in the act of swallowing, so that it practically accomplishes very little of the object sought to be attained by its employment; but if, in addition, the mouth be immediately and thoroughly rinsed with the solution of lime above referred to, or a solution of sup. carb. soda, the evil effects of any acid remedy upon the teeth will be entirely obviated.

In the exhibition of strong alkalies, on the other hand, which lay hold of the gelatinous constituents of the teeth, the fluids of the mouth during illness are usually so pronouncedly acid as to entirely neutralize this condition: but if otherwise, a slight rinsing with a very dilute, simple acid, like tartaric or citric, will accomplish the result desired, though the effect of these remedies upon the teeth is scarcely worthy of consideration, so entirely will the matter of their neutralization take care of itself.

EFFECTS OF ALCOHOL, MEAT, ETC., IN SUSTAINING FATIGUE.

Dr. E. A. Parks writes in the London Practitioner:

"The experience gained during the Ashantee campaign showed that total abstinence improved the health, and that alcohol, though apparently beneficial when given with food after the day's march was done, was injurious while on the march, the reviving effect passing off after, at the utmost, two and a half miles' march had been accomplished, and being succeeded by languor and exhaustion as great or greater than before. When again resorted to, its reviving power was less marked; and its narcotizing influence was often traceable in the dullness, unwillingness to march, and loss of cheerfulness of the men. Meat extract, on the contrary, in quantities of not less than half an ounce at a time, was not only powerfully reviving, but sustaining, and so was coffee, though to a considerably less extent. This evidence in favor of meat extracts is of great value at the present time, when their power to act either as food or stimulants is so much disputed. The sustaining power of thin gruel, made from boiled oatmeal, during heavy work, is well shown in one of the appendices. This agrees perfectly with the observation of Alpine travelers, that small quantities of food at short intervals prevent exhaustion, and with our own experience that, although unaccustomed to exercise, we could carry a knapsack for thirty miles a day without fatigue by simply taking something to eat every two hours."

HYGIENIC NOTES.

Children's Drink.—Arrowroot made into a pap, with fresh milk and some water, is the best thing for a baby. It is as good as the best breast milk. Oatmeal is better for larger children. Sweeten the arrowroot with powdered sugar, not too sweet. But it is so dear; $1 a pound for the best.—Ker.

Drink for the Sick.—Two teaspoonfuls arrowroot in a quart pitcher, with a little cold water; three tablespoonfuls white sugar, juice of one lemon and part of the rind; stir all quickly while pouring boiling water until the pitcher is full. Drink cold.

Insurance Department.

INSURANCE NOTES AND NEWS.

Litigations with Life Insurance Companies.—There has been quite an increase of litigations with life insurance companies within a couple of years. This has been caused in a great measure perhaps by the hard times, which have pressed very heavily upon the finances of third-class companies. Much of this litigation has been of a novel kind, and the decisions rendered by the courts have done much to define the (hitherto ill understood) relations of insured and insurer.

A company has succeeded in evading the payment of a death claim by establishing (what was not denied) that the statements of an applicant, though strictly true when made, were not true when the policy was issued. Another company is sustained by the courts in forfeiting a policy on which payments had been suspended in pursuance of an agreement with the agent, at the time of application, that if payments continued until that time the policy should be nonforfeitable. And yet another company seeks to avoid payment because the last premium was paid partly by note instead of cash—an arrangement by no means unusual and one almost universal, and to which in this case the company has assented.

The records of the courts are full of a variety of such cases where the decisions rendered ignore all parole agreements and understandings with the agent and are based upon the letter of the policy.

The most instructive lesson to be learned from all this is, that the contracts of a certain class of chronically litigious companies are full of traps for unwary and unskillful people, and that in order to transact any kind of business with their agents with safety, it is necessary for the applicant to understand the scope and limit of the agents' authority and powers considerably better than the agents themselves.

Number of Companies.—Two hundred and fourteen companies insuring property against loss by fire are authorized to do business in the State of New York, and perhaps a hundred more are not admitted or have not applied for admission. These are joint-stock companies. The number of mutuals, or companies assessing the means of payment of losses and expenses cannot be conveniently ascertained, since these companies are not compelled everywhere to report their condition or business, and many of them are very small affairs, confining their business to a single county or to a very limited territory. Many of the mutual companies confine their business to farm and other detached property, and a very few are managed with tolerable skill and economy.

In dealing with them it should be remembered that whatever may be claimed on the score of cheapness, the policy holder is not only insured, but is also an insurer and stockholder, liable for his share of the losses to an unlimited extent, and not merely to the extent of the note he gives, and that, too, for part losses and expenses, as well as those which may be incurred during the holding of his insurance. In other words, he takes an *unlimited* amount of stock in a company and agrees to permit other people to run it. This is not "business," nor prudence. Better far buy so much insurance from a sound, reliable stock company and pay cash for it.

"PROGRESS AND IMPROVEMENT."

TERMS FOR 1876, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.65 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $13.40; Seven Copies, and one free, for $17.20; Ten Copies, and one free, $21.50—only $2.15 per copy. The above rates *include postage* (under the new law,) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra—or $3.50 in all. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)	60c.	per line.
" 13th page	.70	"
Outside or last page	1.00	"
Fifty per cent. extra for unusual display.		
Special Notices, leaded, by count	1.25	"
Business "	1.50	"
Reading "	2.00	"

Discount on 4 insertions, 10 per ct.; 8 ins., 15 per ct.; 13 ins., 20 per ct.; 26 ins., 25 per ct.; 52 ins., 33⅓ per ct.

☞ No advertisement inserted for less than $3.

DECISIONS WITHOUT KNOWLEDGE.

We are all more or less liable to acquire the habit of deciding subjects brought before us without possessing any positive knowledge relating thereto. To think, believe, have an opinion based upon what some one has told us, often passes current as personal knowledge, and it is this readiness to take mere assertion second-hand which, more than anything else, prevents progress in rural pursuits.

It is the belief of many that the king-bird is very destructive to bees; but how many know it to be a positive fact? The crow is accused of feeding upon the eggs of smaller species of birds, also to pick out the eyes of chickens and other fowls; but it would be interesting to have one of the crows' accusers cross-examined upon oath and see just how much he did know, as well as the nearness of the two parties at the time of the occurrence. It is not every crow that will permit being approached so near as to be caught sucking eggs, picking out the eyes of other birds, and like rascalities; and the witnesses against them who could testify in the affirmative, and of their own personal knowledge, we opine are not numerous.

Certain species of insects have often been accused of doing great damage to plants by persons who did not know that it was impossible for them to do harm to vegetation of any kind; while others supposed to be harmless were the real depredators, the mistake arising from a want of knowledge to enable the owner to see aright. Not many years since we heard an aged and very intelligent gentleman declare before an assemblage of farmers, that butterflies were eating up all the cabbages in his neighborhood. When his statement was questioned, he reiterated it with emphasis; but every entomologist knows that butterflies have no jaws or mandibles for eating vegetables, but the larvæ or caterpillars have, hence the gentleman referred to had seen the former hovering over the cabbage plants and "supposed" they had been eating the holes found in their leaves. It is not well to strike in the dark, or accuse without knowledge even the insects which crawl at our feet, for there is danger of injuring friends as well as foes.

The same caution in regard to various operations upon the farm are necessary in order to avoid mistakes both in words and deeds, and it is well to know something of the nature of particular plants before believing or asserting that one species may be changed into or bring forth another, as in the case of wheat turning to chess, as thousands of our farmers believe is not only possible but that the transformation actually occurs every year. But we did not commence to write a homily upon superstition and prejudices, but merely to caution our readers against giving a positive decision before knowing, remembering that he who keeps pace with true knowledge walks slowly.

DAIRYMEN'S SQUABBLE.

The report by our Centennial correspondent this week, of the meeting of the Ring Committee at Philadelphia seems to vindicate fully the first position taken by the RURAL in relation to this body. A business meeting was called and the whole day consumed in the calling of bad names, and the exhibition of general dirty linen. A resolution was offered to appoint a committee to investigate the charges made by Mr. REALL and the public press (meaning of course the RURAL NEW-YORKER) and it was voted down and hustled out of sight at once. This we expected. A majority of this wise body do *not* want an investigation. They have no idea of submitting their conduct to examination by an impartial committee, and this action of voting down the investigation is an excellent indication of which way the wind blows.

The Dairy Exhibition is, to be sure, a total failure, but these gentlemen square themselves back in their seats and throw the whole responsibility of it upon the RURAL. Good, gentlemen! We appreciate the compliment and shall in future make excellent use of the influence with which we are credited to put our editorial foot (and it is no dwarf, either) upon everything that smacks of wrong, and save our readers and patrons from harm every time we are as successful in discovering it as we were in this Dairy matter. We wanted the exhibition to be a success; but not at the sacrifice of all principles of honesty and fair dealing. We were anxious that our progressive Dairymen should show to the world those improvements which have been inaugurated here in such rapid succession during the last few years. But that can only be done through the medium of a fair, impartial body of men, who have no axes to grind, and no interests of their own to forward in the exhibition which they have charge. The Centennial Commission have left this whole display in the hands of the committee appointed for that purpose, and the public can now see how they have performed their duties. We are very fearful that material changes will have soon to be made in the personel of this committee if ever a successful exhibition is to be had. The horse may be led to water but he cannot be made to drink. So the dairyman may be provided with conveniences, but he cannot be forced to exhibit; and certainly all the resolutions which this body may pass commendatory of their own conduct, will not convince the public that they are all right, in the face of their past acts. We call upon those members of the committee who are forwarding their personal interests at public expense to resign for that reason, and upon those who are not, to resign because they are in bad company. This we believe is the only course which can save the Dairy Exhibition from becoming a reproach and a laughing stock.

THE POSTAL FRAUD AGAIN.

For nearly two years our people have been subjected to great annoyance by the advance of rates of postage on third-class mail matter. Without the least notice the rates were doubled and our hundreds and thousands of seedsmen and nurserymen who had promised in their catalogues to send out their goods at certain rates, found themselves unable to do so on account of this advancement. Since this change, which cannot be characterized by any more fitting name than a swindle and a direct insult to the entire agricultural community, the Rural press, of one accord, joined in denouncing the act and in demanding the restoration of the old rates upon seeds, plants and cuttings. In response to these demands we were promised a reconsideration; in fact, a bill was introduced for the purpose of restoring the old rates of one half cent per ounce, as formerly and it was reported upon favorably, and soon we read in the daily papers that it had been passed by Congress and received the signature of the President.

So fully had the impression gotten abroad that there was to be a full restoration of the old rates, that a number of our contemporaries announced it as a fact, naming the articles which could be sent through the mails, such as seeds, plants and cuttings, at the rate of one half cent per ounce. But when the act appeared in the official organ of the Post-Office Department, the illusion was dispelled; for the only change made is to permit the sending of books, magazines, advertisements, sheet music, &c., at one half cent per ounce, and all other third-class matter, such as seeds, plants, &c., at double these rates. This is the kind of attention Congressmen generally pay to the wishes and welfare of the residents of the rural districts; and while we point out the fraud perpetrated, it is for them to right their wrongs through the ballot box, being careful that traitors to their interests are permitted to stay at home.

RURAL NOTES.

Politics versus Farming.—One of our subscribers in Connecticut after trying to get up a club for the RURAL NEW-YORKER writes:—"I wish you would give those farmers a rap who will study politics and subscribe for political papers to the exclusion of agriculture and agricultural journals, and all the while keep prating "that farming don't pay." We would be very much pleased to comply with so sensible a request, if there was any likelyhood of its doing any good, but unfortunately the class of men referred to are "wedded to their idols" and ignorance, and as they do not take, or read the RURAL our words, however forcibly expressed, would be of no avail. It is nevertheless true that the old idea "that any fool can succeed as a farmer," is far from being extinct, else the RURAL NEW-YORKER and a hundred other similar journals published in the United States would have ten to twenty times their present patronage and circulation.

Grasshoppers on the Plains.—We hear that the grasshoppers, or Rocky Mountain Locusts, are again making occasional visits to the gardens and fields of Colorado and Minnesota; but no move is being made by the Government to ascertain whether their depredations can be avoided or not. A few thousands of dollars were asked of Congress last year to pay for the services of a competent committee of Entomologists to investigate this locust matter; but it was refused on the score of economy, while the pests proceed on their devastating raids, destroying millions of dollars' worth of private property; not an effort being made to save it. Millions can be had to prevent the raids of the Sioux, but not a cent to check the ravages of the grasshoppers, which have driven thousands of our Western pioneers to the brink of starvation. Consistency, thou art indeed a jewel!

What They Eat in Paris.—Under the general name of "Poultry," there was sold in Paris in the course of 1875, 5,656,779 chickens, 2,106,610 tame rabbits, 1,583,317 pigeons, 706,389 geese, 695,648 ducks, 479,816 turkeys, 126,539 kids, 28,660 lambs and sucking pigs, 14,956 guinea fowls, 21,014 kilogrammes (about 22 tons) of goose livers, 11,617 kilogrammes (about 11 tons) of cocks' combs, 9,308 kilogrammes (nearly 10 tons) of ducks' livers and 121 kilogrammes (more than 2 cwts.) of chickens' kidneys. Altogether, the game and poultry sold during the year represented a weight of 21,064,569 kilogrammes, (more than 21,000 tons), which is equivalent to an annual consumption of about 25 lbs. for each of the 1,851,000 inhabitants of Paris.

Another Binder.—G. E. W., Jr., in the Nation of the 10th inst., seems to have discovered something at the Centennial. After speaking of the different classes of Agricultural Machinery as such, he proceeds to say:—"The crowning success in this branch of the art seems to have been achieved by another machine, where the straw is not only carried up from the binding-table, but where, by the unaided action of machinery driven by the forward movement of the reaper, the gavel is actually bound with wire and thrown to the ground." Will Brother WARING tell us which of these machines he refers to? WALTER A. WOOD & Co. have Lock's Binder, then there are the MCPHERSON, GORDON and MCCORMICK Binders, all on exhibition. Which is the "another machine?" Take another look in Agricultural Hall!

The Rural as an Advertising Medium.—We publish below one of many letters of this stamp that we have received this season, showing that the RURAL, as of old, still holds its own as one of the best advertising mediums in the country:—"For years we have advertised the Halladay Standard Wind Mill in the leading agricultural journals of the country and for some time past, to satisfy our own curiosity, have given each paper credit as named by our correspondent, and we find that the RURAL NEW-YORKER has brought us more letters than all others combined save one.—U. S. WIND ENGINE & PUMP Co."

RURAL BREVITIES.

We have inquiries for Incubators. Who will tell us which of the many in market is best, or if any of them are worth the trouble of testing.

The AMERICAN RURAL HOME, in copying our careful and exhaustive list of Fairs, gives us credit, being an honorable exception to the majority of the agricultural press.

NEW GRAPES are again in order, and we hope those having choice novelties in this line will not forget that the RURAL NEW-YORKER office is a good place to send things of this kind which possess merit.

If any reader of the RURAL NEW-YORKER has ever found or can find Bermuda grass (*cyrodon dactylon*) bearing seed, we should be pleased to receive a sample. A goose quill full will answer our purpose.

From the number of invitations received to attend Fairs this fall, we conclude that the RURAL readers are anxious to see all their friends, and we return our thanks for courtesies extended and intended.

The California Horticulturist informs its readers that the American Pomological Society publishes "every year" one of its valuable collections. This will certainly be news to the members of this Society, who have always been content with a volume once in two years.

ANOTHER interesting Centennial letter from our correspondent "SHORT-HORN," will be found on the fifth page, having been received too late for insertion in our regular Centennial Department. He finds that the muddy waters of the Dairy pool are still in need of a filter.

It is reported that the town authorities of Chico, Cal., have passed an ordinance declaring the honey bee a nuisance without the corporate limits, owing to its occasional habit of destroying fruit. What have our Apiarians to say to this attack on the honey-making or gathering insect?

The fine collection of insects exhibited by the Canadian Entomological Societies at the Centennial Exhibition, are rapidly losing their colors owing to exposure to the light. The Entomologists or Entomological Societies of the United States do not make a show, simply for the reason that they could not afford to see their choice specimens destroyed.

Our old roadside weed as well as petted occupant of "Grandmother's Garden," the Prickly Comfrey, is now being commended as a valuable forage plant—at least, the English journals say that it is attracting considerable attention in Great Britain. It would not be at all surprising if Comfrey and Jerusalem Artichoke should yet take a high rank among our valuable field crops.

A disastrous hailstorm on the 23d of July struck the northern suburbs of London, Eng., doing a great amount of damage to growing crops and particularly glass structures. All kinds of green-growing plants were cut down and even fruits upon the trees were cut into shreds. The nurserymen and gardeners suffered severe losses, so much so that subscriptions are being raised for their relief.

ERTEL'S Portable Hay Press is something novel and original in this line which should command investigation at the hands of farmers. Those who bale hay understand the importance of having it done well and cheaply. Where it is a question of the saving of money, it behooves our readers to learn the particulars of the process. GEORGE ERTEL, Quincey, Ill., issues a free pamphlet explaining this press fully. Send for it.

HAVING been somewhat censured for the seeming harshness of our note in last week's RURAL, when referring to the attempted suicide of F. R. ELLIOTT, in hinting that it might be an advertising dodge, we beg leave to call the attention of our kind-hearted critics to the fact that the gentleman has since published a card in a Rochester paper over his own signature, admitting that said act gave him as much free advertising as he could have obtained for $300 in cash.

MAKE HAY WHILE THE SUN SHINES.

BY F. H. W.

THERE is an old maxim I wish you would read,
And when you have read it, its counsel would heed:
"Make hay while the sun shines;" you see it is old,
And yet it is worth a whole bag full of gold.

So work while the sun shines, and never delay
The work to be done on a sunshiny day;
For if you put off till to-morrow's begun,
The day may be wet, and your work go undone.

Make hay in life's sunshine by doing good deeds
To those who are round you with many great needs,
And the good deeds you do in the sunshine of life
Will strengthen your heart in the heat of the strife.

AMERICAN SCENERY.

THE engraving on this page, which we are enabled to give our readers through the courtesy of Mr. HENRY T. WILLIAMS, is a faithful representation of a very striking bit of American scenery. The American Canon is, perhaps, the grandest natural view on the line of the Pacific Railroad, and approaching it suddenly the scene is so overpowering as to mock description. At a distance of two thousand feet above the quietly-flowing American River winds the track of the iron horse around curves and rocky promontories that might well instill fear into the stoutest heart. To quote the language of Mr. WILLIAMS:—"Westward is seen the chasm where light and peak and summit hang loftily over the little vale. Southward is a sea—yea, an ocean of mountains—and the observer, seemingly upon the same level, is bewildered at the immensity of Nature's lavish display of mountain wonders; night comes on and the hights catch the soft light of the moon as it shines and twinkles across and among the tops of the pines, lighting up the open canons and rendering still more deep the contrast with the shady glens—the snow fields, cold, white and chilling, with ever-changing turns of the railroad, make the evening ride, beyond a doubt, the most pleasurable that ever falls to the lot of the sight-seer. The tourist must stay up long—see for yourself all the beauties of the Sierras, while there is the least possible light; Emigrant Gap, Summit, Donner Lake, Blue Canon—all are delightful, and the lover of scene pleasures must not forsake his window or the platform till the midnight hour finds him at Truckee."

There is scarcely a person traveled or untraveled, who has not heard of the Sierras or "saws," and some of the most popular recent literature has its scenes laid among these mountains and the wonderful country adjacent thereto. Description, however, fails to convey an adequate idea of the sublimity of most of these scenes.

Speaking of the effect of moonlight, Mr. WILLIAMS says:

"Just at evening, when the sun casts its last glorious rays across the mountains and lights up the peaks and snowy summits with splendor, the train arrives at Cape Horn, and the thrill of interest of the excited tourist will never be forgotten. Take a good look from the point, westward down the grand canon of the American River. Step toward the edge of the cut and look down the fearful precipice, which is often broken ere it reaches the lowest descent of 2,000 feet. It is a scene more famous in pleasure travel than any yet known."

Prof. HAYDEN, in his printed report of the survey of the Colorado, gives descriptions of canons, mountain fastnesses and relics of extinct civilizations, that read more like the emanations of brilliant fancy than stern reality; and as one pursues the pages with breathless interest, still the wonder grows that we have within our national boundary a country which for variety, extent and sublimity of scenery, would be the everlasting fortune of some country beyond the seas, where it would be enormously advertised and all wealthy Americans would surmount every obstacle to gaze upon its wonders and patriotically sigh over the fact that his country did not contain such a clime. Truly, we do not half appreciate our fortune in this respect.

One fact strikes the American tourist with full force in his journeyings toward the setting sun, and that is, wherever he goes there will he always find the ubiquitous "Jons." The Chinaman has oozed into the most out-of-the-way places, and his entire willingness to do twice the labor for half the pay demanded by the Caucassian, naturally causes him to be looked upon with sentiments of wholesome disgust. Those among us who are "born tired," cannot brook such proceedings, of course. As cooks the Chinese are superior. The author says of them:

"Americans who dine with the Chinese are surprised at the perfection to which they carry their cooking. During a recent Chinese banquet in San Francisco, an orange was laid at the plate of each guest. The orange itself seemed like any other orange, but on being cut open was found to contain within the rind five kinds of delicate jellies. One was at first puzzled to explain how the jellies got in, and giving up that train of reflection, was in a quandary to know how the pulpy part of the orange got out. Colored eggs were also served, in the inside of which were found nuts, jellies, meats and confectionery. When one of the Americans present asked the interpreter to explain this legerdemain of cookery, he expanded his mouth in a hearty laugh and shook his head and said, "Melican man heap smart; why he not find him out?"

Reading of such scenery, every true American may feel a just pride in the wonders of this marvellous country; and when the traveled tourist prates of the Rhine, Alps and Mediterranean, we can match the scenes, and the grandeur of our scenery causes them to pale their ineffectual fires.

GIANT'S GAP, AMERICAN RIVER CANON.

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 109.]

ORIGINAL BOUNDARIES.—The original boundaries of the United States as defined by the treaty of 1783 were as follows:

"Commencing at the northwest angle of Nova Scotia—viz., the angle formed by a line drawn due north from the source of the St. Croix River to and along the highlands that divide the rivers that empty themselves into the St. Lawrence River from those that fall into the Atlantic Ocean—thence down the middle of said river to latitude 45°; thence due west to the Cataraguy (now Upper St. Lawrence River); thence along the middle of said River to Lake Ontario; thence through the middle of Lakes Ontario, Erie, Huron and through the middle of the water communications of said lakes to Lake Superior; thence through Lake Superior northward of Isles Royal and Phillpean to the Long Lake; thence, through that lake and its water communications to Lake of the Woods, to the most northwest part thereof; thence due west to the Mississippi River; thence through the middle of the Mississippi River to the northermost part of the 31° of north latitude; thence due east to middle of the river Apalachicola or Catahouche River; thence along the middle thereof to its junction with the Flint River; thence straight to the head of St. Marys River and along the middle thereof to the Atlantic. Then by a line to be drawn along the middle of the river St. Croix from its mouth in the Bay of Fundy to its source and from its source directly north to the aforesaid Highlands, comprehending all islands within twenty leagues of the coast of the United States between lines drawn east from the terminal boundary line at Nova Scotia and East Florida, except islands now or heretofore within the limits of the Province of Nova Scotia."

At this time only six of the States had definite bounds. These were New Hampshire, Rhode Island, New Jersey, Pennsylvania, Delaware and Maryland. Massachusetts claimed, under charter, all between 41° and 48° throughout the main lands from sea to sea and the territory of Maine. Connecticut held that her charters and grants covered territory between lines drawn in continuation of her north and south bounds to the "Great South Sea." Virginia claims were founded on the grant to the Virginia Company in 1619 all between the Ohio River and the continuation of her southern bound, as well as a large tract north of the Ohio; and still further, by right of conquest, much territory now comprised in the States of Indiana and Illinois, having in 1778, without aid or direction from the Congress, sent a force under Gen. GEO. ROGERS CLARK into that territory—then in possession of the British—to prevent, if possible, further Indian forays on her Kentucky border. This expedition in that year took Kaskaskia and the year following captured Vincennes and the fort near by, pushed across the country to the Mississippi and erected a fortification on that river.

North Carolinia claimed the territory now comprised in the State of Tennessee as well as a strip twelve miles in width adjoining the southern bound of Tennessee. When the line between South Carolina and Georgia was established, it was found that a tract twelve miles wide adjoining North Carolina, remained to the former State, while all south of that westward was claimed by Georgia.

Soon after the confirmation of the treaty of 1783 the six States with defined boundaries made petition to Congress that whereas they had contributed both men and money to the prosecution of the war and thus aided in securing the territory beyond the mountains to the Federal Government, they should be entitled to receive some advantage therefrom. The question was warmly debated in Congress and resulted in a request from that body that the States claiming ownership in said territory should relinquish their claims thereto to the General Government of the United States and proposing that the proceeds of the sales thereof should be used to pay the public debt which, with some reservations, was finally acceded to.

There had been much dispute between Massachusetts and New York as to territorial rights, which was settled in 1781 by the relinquishment of the former State of all jurisdiction within the present limits of the latter reserving, however, the right of soil and pre-emption to all land lying "west of a meridian line drawn from the 82d mile post in the Pennsylvania line," excepting some reservations on the Niagara River. This line commenced at the now southeast corner of Steuben County, strikes the western shore of Seneca Lake and reaches Lake Ontario at Sodus Bay. All west of New York claimed by Massachusetts was ceded to the United States in 1785.

In 1786 Connecticut ceded her rights in all the territory west of Pennsylvania (having previously relinquished title to all east to Pennsylvania and New York) except in a tract in the northeast part of Ohio, comprising 3,666,000 acres, still known as "The Reserve." Of this, in 1792, 500,000 acres were given to citizens of Connecticut whose property had, during the Revolution, been burned by the British. This tract was known as the Fire Lands.

In 1795 the remainder of the Reserve was sold to the Connecticut Land Company for $1,200,000. This money was made a permanent fund for the support of public schools of the State of Connecticut. Jurisdiction in this Reserve was surrendered to the General Government in 1807 and was immediately transferred to Ohio.

The claims of New York to any portion of this western territory appear not well founded; but to prevent any future misunderstanding, as well as to fix her western boundary, in 1780 deeds of cession were made of all right in and to lands west of a meridian drawn through the west end of Lake Ontario. It is supposed there is a reason for all things, but I have never been able to learn why this point was chosen from which to determine the bounds of New York.

In 1784 Virginia relinquished all claims to territory north of the Ohio River reserving, however, the right to locate boundary lands between the Scioto and Little Miami Rivers, if it should be found she had not sufficient territory south of the Ohio and in 1785 ceded all south of that river. In 1790 North Carolina gave up what is now Tennessee.

In 1787 South Carolina ceded the 12-mile strip before mentioned, and in 1802 Georgia relinquished her rights to whatever was west of her present bounds, receiving the territory between her northern limits and Tennessee.

In 1786 the western line of Pennsylvania was determined to be a meridian drawn from the southwest corner of Pennsylvania to the territorial line and the line between Pennsylvania and New York to be in its western part and mainly on the 42d parallel. This left a tract belonging to Government triangular in form containing a little over 200,000 acres entirely detached from any other Government lands. Pennsylvania desiring a port on Lake Erie, purchased this "heater piece" in 1788 for 75c. an acre.

Most of these cessions and transfers were accompanied by some restriction or conditions, which it is not necessary for our purpose to notice. Thus the Government of the United States became possessed of all territory between the western limits of the interior States and the Mississippi River, which was subsequently given Territorial Governments and finally erected into States.

—[To be continued.

The Story-Teller.

TOO LATE.

BY MAY MAPLE.

I WAS the youngest of the family, consisting of the parental heads and eleven children. Start not, gentle reader, at the idea of so numerous a progeny; a large family was, at the time of my advent, the pride of our ancestors. But I was destined to be the "black sheep" of the flock. I was not like the rest of the youngsters, and "*Too Late*" must have been stamped with lines of flame upon my brow from the very first hours of my existence. Even in my infancy I was troubled with a consciousness that I was not petted and tended like the firstlings of the flock. Ah! I was too late to be a rarity; and as I was usually in good health and therefore good-natured, it was quite unnecessary to bestow much attention upon me. Thus I was left for hours in the little pine cradle to amuse myself as best I might.

As years passed I never ceased hearing the words, "JUNE, you are too late;" "JUNE, why will you always be late?" or, "JUNE, do be quick for once in your life."

Try as I would, I never could be quite up to time. If sent on an errand, I invariably started off on a run, determined to please my dear mother, of whom I was passionately fond. But before I could return some bright-winged bird or rare flower, a running brook or laughing breeze, a fleecy summer cloud or fairy castle, would set me to loitering by the way, and instead of returning immediately, I would be absent for hours ere I would become aware that time was fast flying beyond recall.

I was seldom in season at school; therefore, there was a long list of "tardy marks" against my name. Yet, strange as it may seem, my lessons were always marked perfect. And now I have to regret the hours wasted, when I might have made such large additions to my stock of knowledge. For I learned rapidly, never spending over fifteen minutes on a lesson; so the rest of the time was in a manner wasted. But fancy was busy weaving delicate webs and embroidering them with delightful visions of a grand and noble womanhood. I could not realize that it was necessary to improve the moments as they went sweeping by, in order to develop a lofty character and to stamp nobility upon the brow. I did not think it needful to gather up the fragments, and thus much was lost. Ah, these fragments! how much of life's pleasures aye, its best joys, are tossed away with the fragments. Our understanding must be broad and deep if we would improve all the gifts the great Father has bestowed upon us. Careless of all these things, the time for making the most of my opportunities passed away and I heard the time-bells chime out the words, "too late."

When I had walked under the blue canopy of heaven fifteen years, I became very anxious to have a flower garden. My cousin FLORENCE had one, and it was always a rare treat to visit her grounds. The paths were delightfully clean and no weeds were ever allowed to make themselves at home in their society of the superiors. I was sure it would be a pleasure to take care of the flourishing plants and gaily-tinted flowers.

My indulgent father gave me a plat of ground and a well-filled purse with which to purchase choice seeds, also a set of handsome garden tools. For days I worked faithfully, fitting the ground, arranging beds and sowing seeds. At last the work for the time was completed and I had only to watch and wait for the appearance of the tiny green leaves. For a week I visited my garden daily, only to see the clean, brown earth laid out like patchwork in circles, diamonds, squares and triangles, with miniature valleys between.

About this time I went to visit my grandmother and was absent three weeks. On my return I took the earliest opportunity to visit my garden. I was almost in ecstacy to find so many thrifty, beautiful plants, to give me welcome greetings. I also discovered various weeds trying to put on airs and appearing quite as vigorous as their more aristocratic neighbors. I thought I could destroy this unwelcome guest at any time and thus for days I quieted my conscience until I heard my brothers laughing about "JUNE'S procrastination beds," and declaring that the plants ought to grow, as "they were in feed up to their eyes."

I resolved at once to put the garden in order. But alas! I had waited too long. When I removed the weeds many of the plants were uprooted, and the few that remained drooped and withered when left without the protecting shade of the weeds. My flowers were not numerous that season, and my garden was pointed 'out as "one of JUNE'S failures."

A few years slipped by with only the chugrins common to a large class of people; and then my aged grandmother was taken suddenly ill and desired my immediate presence. My sister JESSIE, who was two years my senior, volunteered to accompany me. I had always been the old lady's favorite, notwithstanding my glaring faults, and she had frequently declared that the pretty village home which she possessed was to be mine when she was laid away in the churchyard beside her husband.

JESSIE and I left home together on our way towards the depot. We had gone nearly half the distance when I discovered that my purse was missing. I turned to retrace my steps with JESSIE'S advice to "hurry," ringing in my ear. Several minutes were taken up in hunting for the missing purse, for I had quite forgotten where I had put it; but at last it was found and I returned almost with flying feet and reached the depot in time to see the train moving off and my sister's handkerchief fluttering from the car window. No other train was due till evening, so I was obliged to go home and wait until night.

When on the following morning I reached my grandmother's cottage, I found the house shrouded as it seemed, with a solemn stillness. The dear old lady was dead and her will had only been made a few hours before her departure to the better land, and it was made in favor of my sister JESSIE, because "she was always *prompt*."

I was scarcely twenty years of age when my father was borne to the silent city and the family left without a provider. Then it was that I began to realize how precious those hours were which I had spent in listless dreaming.

I was offered the situation of preceptress in our village seminary; but I knew too well that my qualifications were not such as to warrant success; I must therefore be satisfied with the more humble station of assistant teacher.

During the second year of my labors I became acquainted with HARRY LEE. He possessed a handsome face, majestic form, and was easy and graceful in manner; wealthy he was not, yet he was far from being poor; he had studied to be a physician and was already winning laurels by his skillful practice. His good name was above reproach and when, after six months' acquaintance he told me that he loved me and asked me to become his wife, I believed that heaven was very near to us; for I loved HARRY LEE with a devotion that was next to idolatry. And so our vows were plighted. It was now leafy June, the beautiful month after which I was named. For three months I lived in a sort of paradise; my life was rose-colored. My wakeful hours were filled with unalloyed happiness, and when I slept I dreamed of joys that could scarcely be surpassed. But this great joy could not last; already there had been slight clouds—silver-lined, but clouds nevertheless—of difference between us; indeed, they were so small, that I had not deemed them worthy a second thought, forgetful that "trifles light as air make our weal or woe."

There was to be an excursion party to visit Niagara and HARRY invited me to accompany him, saying it would be necessary for us to be at the depot promptly at nine o'clock: he wished me to be entirely ready when he called for me, as business would detain him until there would only be sufficient time to procure tickets and get seats with the company. Almost the last words he said as he parted the evening previous were, "JUNE, be sure to be *ready* when I come in the morning."

Before I retired I laid out, as I thought, every article of my wardrobe that I should need for the occasion determined, for once in my life, to be prompt. Morning came and I made haste to prepare myself for the journey. There was nearly half an hour to spare when I pronounced myself ready; my hat and wraps were conveniently near—I could put them on while he was coming down the street. I seated myself by the window to await his appearance, that I might finish my preparations as soon as I could catch a glimpse of him. For perhaps three minutes I kept my eyes upon the street and then I caught sight of a book on the table near me in which I was deeply interested. I picked it up—and that was the last I remembered of HARRY or his injunctions until I heard the gate swing.

Putting on my hat and shawl scarcely occupied two minutes, and then my gloves—but they were not to be found: after a hasty search here, there, everywhere, turning everything top to bottom, bottom to top, I found them at last in a paper just as I had brought them from the store. Of course it took some time to fit them and when I joined HARRY I had kept him awaiting a full quarter of an hour. We reached the depot just in time to see company and train disappearing swiftly round "the curve." HARRY left me at my own door, bidding me a cool "good morning," and passed on towards his office. That evening's mail brought me a highly-perfumed note, which read as follows:

"MISS DAVENPORT:—Please consider our engagement broken; we could never live happily together. I confess I have no disposition to treat your continual delays with martyr-like endurance. If to-day's disappointment were the first, I would not reproach you. But it is useless for me to numerate the times, and just as useless for you to make any apologies. I shall take the evening train for the Old World. May you be happy, is the sincere wish of HARRY LEE."

And thus ended my bright dreams of happiness. My pillow was wet with bitter, scalding tears; grief and remorse brought no sunshine to my heart. Must I be always haunted by those two small words? Must they dash every cup of joy from my lips? Dark, wild thoughts of putting an end to such a useless life filled my mind. The early rising sun peeped in to my chamber and found me raving in delirium; and for weeks I was unconscious.

When at last I began to recover and was told how very near to death's portals I had hovered, I only wished they had let me die. There were long days of convalescing, when I had plenty of time to form new resolutions for my future course of action. But while I found it a pleasure to *resolve*, to perform was quite another thing.

Again I took up the thread of life and for a time filled the warp with work promptly done. But not many months elapsed ere Nature asserted herself, and then there were skips and loops, thin places in the web that would not bear close inspection. I was living in dreamland again and allowing my garden to be overrun with the vile weed of procrastination. Again I received a lesson—or rather a chastisement—for my delinquencies.

On entering the recitation room one morning in midsummer, I found upon the table a note addressed to "MISS JUNE DAVENPORT, teacher." Upon reading the missive I found that my services were to be dispensed with at the close of the week. I was so frequently "too late," the committee had thought best to hire another assistant in my place. What was to be done? I could not get another situation immediately; to ply the needle I had no taste except for myself. Thus for weeks I was undecided and of course perfectly miserable.

At last I determined to go out to service; better that than idleness. As if to further my plan I saw an advertisement in the morning paper. A certain family were in need of good and efficient help, for which good wages would be paid. I would apply immediately.

I had nearly completed my preparations for the walk when I spied a humming-bird and a small company of butterflies apparently having a bit of a confab over a flower bed in the garden just outside my window. Mistress Humming-bird declared, to all intents and purposes, that that plat of flowers was for her especial sipping. While Madame Butterfly and her set declared they had occupied that ground long before she came from the sunny South. For nearly half an hour the debate lasted, Mistress Humming-bird descending from her perch in the jasmine with a swoop, a buzz and a squeak, to dive with her long beak at the defenceless butterflies every time they dared to alight on a sweet-scented flower. It was a matter of firm perseverance on both sides; but Miss Humming-bird's patience held out till she had driven the last enemy from the field, and then seated herself with much complacency upon her favorite perch, to arrange her glossy plumage in the most exquisite style. The battle had lasted ten minutes. I drew on my gloves and bent my steps toward the residence of Mr. STANLEY. Upon arriving there I was told that the place had been supplied a few moments previous. I only had to swallow my disappointment as best I could.

At last I was glad to accept a very inferior situation and small wages. I soon wearied of the drudgery, with the continual frettings of Miss HUNTER, and when I received an offer of marriage from Mr. CARROL, who had wealth, position and a pleasing address, I determined to accept the offer and thus provide myself with a home and comforts. We were married and, for a time, my lines seemed to have fallen in pleasant places. I was just congratulating myself on my opportune promptness, when I learned that my husband was a professional gambler, and I had been brought up under the good old Puritan rule.

Alas! "too late" rang out on the still evening air, and the morning's dawn did not forget to whisper it in my ears. I had married in haste, with but little consideration as to congeniality. I could only make the best of life and hope that I might influence him to give up the dreadful business, even though it caused us to walk in the alleys of poverty. My husband was invariably kind to me, and for this I was grateful. We were blessed with one child, a beautiful boy; on him I lavished all the love of motherhood. I made an idol of the beautiful clay and on no account would I have him crossed. CHARLEY must do as he liked and have whatever he wished.

His father tried sometimes to show me how foolish I was and how poorly I was fitting him to fight the battles of life; how selfish and willful he would be as he approached manhood if allowed to grow up under my present course of training—but all to no purpose; I would not listen to his counsel. I never permitted him to attend the public schools until he was twelve years of age, for fear of his being hurt by the children or reproved by the teacher. But at this early age he was my equal in nearly all the common branches. He was quick to learn and had within him grand possibilities. But my days of sorrow were coming nearer. I was sowing seeds that would come up and pierce me with thorns; yes, "sowing the wind to reap the whirlwind."

When CHARLEY was scarcely fourteen years of age, in a fit of anger he drew a pistol and shot one of his companions, threatening to shoot another if he interfered. "I'll let you all know that my word is not to be disputed," said the wayward boy with flashing eyes and livid features.

Not till the verdict of "Guilty of murder" was rendered did I realize fully what I had done. My darling, my only son, sentenced to a life of solitary imprisonment for a long term of years, that would in all probability end only with life. Oh! how I entreated to be sentenced with him; and when this was not permitted, I begged with bowed form to take his place; surely I was the first cause of all this trouble. I would willingly endure the punishment. Even the privilege of accompanying him to his cell was denied.

When I visited him for the last time, how my heart bled for the erring, repentant boy. Embracing me, he exclaimed:

"Oh, darling mother! I do not wish to reproach you; but if you had only taught me obedience, I should not have transgressed the commands of GOD; I should then have learned to control my temper and respect the rights of others. But it is too late now. I know that you love me, though there is blood upon my hands. My sentence is dreadful but just. I should scarcely dare to have it otherwise; for who knows how soon I might be guilty of the same crime again? There is no hope for me. When I am angry, no one is safe that is in my power. So I must give up all there is in life worth living for; all my high aspirations and thoughts of human greatness, good impulses, must all culminate in the criminal's cell."

The form of my child was convulsed with pent-up grief and I—how could I comfort him? Surely, no sorrow was like unto my sorrow. Amid tears, sobs and groans, I was torn from my beloved idol.

My husband was used to scenes of violence. But when his own son was brought to the prison cell, it was more than he could bear. "Too late," chimed out on the still air of our quiet rooms. "Too late" was each made to see the failure of our lives. We could only repent and pray that it might not be too late for ourselves and our loved one to seek the pardon of Him who chastiseth in love and "Who removeth us far as the east is from the west our transgressions from us," when we earnestly seek his face.

THE COMFORT THERE IS IN AN EGG.

"The spring is coming," I said to my wife the other morning. My wife replied that she "could not discover it."

"This egg justifies me in declaring that spring is coming. I don't mean to say that the daffodils have made their appearance—I base my opinion on the arrival of this egg. Hens, my dear, know more than you think about the seasons. They have their spring-time fancies, and one of their fancies is to lay eggs. Sometimes one will drop an egg in mid-winter, even as a happy afterthought is occasionally uttered by a merry fellow after the feast is over and the ashes are raked up in the fireplace."

My wife interrupted me to say that she didn't like me to tell her anything about it.

"Eggs," I said, "are historical. The subject carries us back to the time when the goose was in the habit of laying 'golden eggs,' and had it not been for the avarice of one person, who slaughtered that goose in the hope of rapidly making a fortune, that breed might have descended to the present time and those golden eggs would have greatly assisted in paying the income tax."

LOVE as if you should hereafter hate, and hate as you should hereafter love.—*Chilo.*

Sabbath Reading.

ON "THE OTHER SIDE."

Oh heart, my heart, how strange to yearn no more
With weepings bitter for thy long-lost peace;
How strange to find thyself at Heaven's door
Where tears forever cease.

In the fair country where sin enters not,
And where abideth everlasting rest,
Think you, my soul, your sins shall be forgot,
And ye be blest?

No more, no more, to hunger there for love,
No more to thirst for blessings long desired.
"Thy face is foul with weeping," but above
Thou shalt be satisfied!

What shall it be to find all fair within,
Pure as the angels in the highest Heaven;
To feel no more temptation, and no sin
That needs to be forgiven:

No more repining—no more vain regret;
No longing to lie down and fall asleep?
Oh heart, my heart, how strange when ye forget
The way to weep!

Oh, light divine that shineth from His face,
In the fair country that doth need no sun!
Oh, happy soul, be thankful that thy race
Is well nigh run?

Roll golden sun—roll swiftly toward the west;
Down happy day when many woes shall cease;
Come quickly, Lord, thy people wait the rest
Of Thine abiding peace.

INFLUENCE OF GOOD WORDS.

"WHEN that devoted missionary, Robert Moffat, was in England, he told an amusing story of a poor African who lived near one of the missionary settlements and whose dog, by some accident, had got possession of a Testament in the native language and tore it to pieces, devouring some of the leaves. This man came to the missionaries in great dismay and laid his case before them. He said that the dog had been a very useful animal and had helped to protect his property by guarding it from wild beasts and also in hunting and destroying them; but he feared it would be useless for the time to come.

The missionary asked him how this was and why his dog should not be as useful as formerly. As for the injury done, that was but an accident and the Testament could be replaced by another copy. "That is true," said the poor man; "but still I am afraid the dog will be of no further use to me. The words of the New Testament are full of love and gentleness; and after the dog has eaten them it is not likely that he will hunt or fight for me any more."

COULD many a parent foresee what God in mercy hides—the unhappy fate and fortunes of his child—when its life is trembling in the balance and his heart, as he hangs over the cradle, trembles for the issue—he would hesitate to pray God to spare, to turn aside the impending stroke. Though the parting is bitter and it wrings his heart to watch the ebbing, the dying agonies of the infant's life, he might be dumb, opening not the mouth; accounting it better, much better, his child should die and go to heaven than live for the fate before it.—*Dr. Guthrie.*

THOUGHTS FOR THINKERS.

WORTH, and not wealth, is a nation's safety.

WHEN love is warmest, praise is longest—the heart helps the tongue.

WHAT can grace not do? for it raised saints even in Cæsar's household.

EVERY man is born for heaven; and he is received in heaven who receives heaven in himself while in the world, and he is excluded who does not.—*Swedenborg.*

GRANT, we beseech thee, merciful Lord, to thy faithful people pardon and peace, that they may be cleansed from all their sins and serve thee with a quiet mind.—*Episcopal Prayer Book.*

PRAYER is a sincere, sensible, affectionate pouring out of the soul to God through Christ, in the strength and assistance of the Spirit, for such things as God has promised.—*Bunyan.*

HE that knoweth how to live inwardly and to make small reckoning of things without, neither requireth places nor awaiteth times for the performance of religious exercises.—*Thos. a Kempis.*

WE shall find difficulties in all great enterprises; if we are sure we have begun them from God, we may securely cast all events upon his providence, which knows how to dispose and how to end them.—*Bishop Hall.*

UNSOLVED PROBLEMS.—"What shall it profit a man if he shall gain the whole world and lose his own soul? Or what shall a man give in exchange for his soul?" How shall we escape if we neglect so great salvation?

WILT thou not go home, my child? Away, for the danger is pressing! go home to God and get out of trouble. Array thyself in such garments as will please the Lord! Get ready, O pilgrim, for thy eternal home.—*Hedinger.*

IF you can really make a man believe you love him, you have won him; and if I could only make people really believe that God loves them, what a rush we would see for the kingdom of God! Oh, how they would rush in!—*D. L. Moody.*

FOR some are too proud to forgive themselves till the forgiveness of God has had its way with them, has drowned their pride in the tears of repentance and made their heart come again like the heart of a little child.—*George Macdonald.*

Ladies' Portfolio.

LINGER NEAR ME, LITTLE TREASURE.

BY EBEN E. REXFORD.

Linger near me, little treasure.
When I have you by my side
I forget all care and trouble,
And that ill may life betide.
I remember only, darling,
That the one I love is near;
In the sunlight of your presence
All the shadows disappear.
Linger near me, little treasure.
Oh, how rich a man am I!
Not a king on earth is richer,
For no gold your love can buy.

Linger near me, little treasure.
Let me look into your eyes,
Where the sweetest violets blossom
Underneath the summer skies.
Put your hand in mine, my darling,
And believe the words I speak,—
Never any rose was fairer
Than the roses of your cheek.
Linger near me, little treasure.
Oh, how rich a man am I!
Not a king on earth is richer,
For no gold your love could buy.

Linger near me, little treasure,
While the days are passing by;
Meet me with a kiss at nightfall,
And the lovelight of your eye.
Oh, my darling, life without you
Would a dreary journey be.
Let me keep you always near me,
For you're all the world to me.
Linger near me, little treasure.
Oh, how rich a man am I!
Not a king on earth is richer,
For no gold your love can buy.

WOMAN'S PLACE IN NATURE.

MAN'S place in nature seems to be pretty clearly defined. In spite of the fact that he "is descended from a hairy quadruped, furnished with a tail and pointed ears, probably arboreal in its habits," and that he "still bears in his bodily frame the indelible stamp of his lowly origin," he is the best thing that we know; and when we formulate a God we are obliged to make him a man. It is the Father, the Saviour, to whom we pray, not to abstract force—which, however, is the sign of the power by which we live; it is man whom we worship in his ideal, man whom we credit with these possibilities of godhead, and the attainment of absolute perfection, great gravitation, electricity, nor yet the protoplastic cell. This, then, is his place, in spite of his descent—the highest expression of embodied intelligence known to us; in his perfection, according to his idea, a God. And woman? Up to this time civilized society has been for the most part founded on the principles that the greater includes the less, that two halves make one whole, and that man has meant also woman. Sex has been looked on as complement, not antagonism; and the laws regulating the division of labor and the appointment of duties have rested on the recognition of differences, and the belief that by those differences and their free exercise we come to harmony. Man has been man and woman woman, and hybrids have not been encouraged. But we have changed all that now. Tired of the uninteresting division made by nature and society into well-defined men and women a third sex is rising into social being: and we have to find a name and place for those odd men-women, those creatures of intermediate class, who are planting their feet in the middle distance between the two extremes, calling loudly on men and gods to witness their daring—and their transformation.

Retaining nothing of the one sex but its form, gaining nothing of the other but its rough-hewn license and abandonment of inconvenient delicacy, these men-women are the analogues of those queen compounds which make the despair of scientific classifiers. How can we call them women when they have rejected as the signs of their shame every mental and moral attribute by which women have hitherto been known, and for which they have been loved? But how are they men when they have nothing of the bodily strength, the mental power, the logical faculty by which these govern and make themselves respected? What can we say to women who voluntarily fling themselves into circumstances where they know that they will lose their tenderness, their modesty, their unselfishness, their devotion? who voluntarily renounce all the sweetnesses of womanhood, persistently deride its characteristic virtues, and spurn its appointed duties? who see in life only an arena where victory is to the strongest, and where "each for himself" is a cry that makes a louder echo than those old-fashioned versicles about doing unto others as we would they should do unto us, and in honor preferring one another. What can we say to them when they think womanly unselfishness a mark of mean-spiritedness? Motherly affection a mere animal instinct shared with the brutes, and not ranking higher than that of the brutes? Maidenly modesty a confession of mental inferiority taught by long ages of oppression by tyrant man, and which it is incumbent on the emancipated to throw off without delay, as a slave throws off his fetters, a prisoner escapes from his cell? Where place them—those women who, in Paris and elsewhere, study anatomy and pathology side by side with young men, and who hold the fact that they feel neither shame nor repugnance, a proof of their superiority to prejudice, not of their callousness to womanly delicacy and their abandonment of self-respect?—those women who are ready to discuss in public the most revolting subjects, and to handle without disguise the most delicate details?—those women whose highest ambition it is to be notorious, and to whom the quiet modesties, the unobtrusive usefulness of home, are the ultimates to which dreariness and degradation can go? Can we call them women in one single spiritual or mental essential?—and as little men!—*Belgravia.*

PET NAMES.

THE pupils of the Quebec Normal School presented Lord DUFFERIN with an address on the occasion of the annual distribution of prizes, to which his Excellency replied as follows:

We who are anxious about the future of our country must have great satisfaction in considering that there should exist in the various Provinces of Canada such an admirable machinery as is provided by these Normal Schools for the diffusion of an atmosphere of cheerfulness, elegance, purity and intellectual activity in the homes of the Nation; this is especially true as applied to the women teachers of our schools, for it is on them that we must depend for the maintenance of a proper standard of good manners, of refinement and high moral tone of which these qualities are the outcome, and I trust you will always remember that the execution of this portion of your functions is not less imperative upon you than are the other branches of the profession.

And in relation to this particular part of your duties there is one peculiarity I have observed in this country, though not indigenous but imported, which I think you might use your influence advantageously to correct. I observe that it is an almost universal practice upon this continent, even on public occasions, in prize lists, roll calls, and in the intercourse of general society, for young ladies to be alluded to by their casual acquaintances, nay, even in the newspapers, by what in the old country we would call their "pet" names, that is to say, those caressing, soft appellations of endearment with which their fathers and brothers and those who are nearest to them strive to give expression to the yearning affection felt for them in the home circle. Now, it seems to me to be a monstrous sacrilege, and quite incompatible with dignity and self-respect due to the daughters of our land, and with the chivalrous reverence with which they should be approached even in thought, that the tender, love-invented nomenclature of the fireside should be bandied about at random in the mouths of every empty-headed Tom, Dick and Harry on the street whose idle tongue may chance to babble of them.

For instance, in the United States, before her marriage, I observed that Miss Grant, the daughter of the occupant of one of the most august positions in the world, was generally referred to in the newspapers as "Nellie," as though the paragraphist who wrote the item had been her playfellow from infancy; and even Lady Dufferin, I see, has become "Kate" in the elegant phraseology of a United States magazine, though how Kate could have been elicited from her Excellency's real Christian name I don't know. Of course this is a small matter to which I have alluded, but it is not without significance when regarded as a national characteristic. After all, the women of this continent are ladies as refined, high-minded and noble-hearted as are to be found in any country in the world, and the sooner we get rid of the vulgar solecism the better, and the first place where the correction should be made is in our school lists, which are official documents, where young ladies should be entered in their full Christian names, and not in their nicknames, as I have often seen done.

THE EMPEROR OF CHINA.

THE Emperor of China is six years old. His mother and grandmother—the two Empresses regent—are anxious for his early education. He will study in the Jou-King room of the imperial palace; Hong-Toung-Hoet and Hia-Toung-Schian will be the tutors to instill into his majesty's mind all the necessary sciences. He will learn the Mantchou and Mogol languages and literatures at one and the same time, with riding, archery, swimming, plowing, and other bodily exercises. The prettiest part of the business, however, is, that from the day his education begins there will be appointed for his majesty a companion destined to receive all the floggings incurred by the imperial boy, and the 14th of May is considered by the astrologists as the most propitious moment for his education and these floggings to commence.

SERENITY OF CHRISTIAN FAITH.

An English lady observed an aged German peasant stooping in his little patch of ground, all his earthly possession, to pick the pears which fell from its one tree and said to him:

"You must grow weary in such labor at your time of life, so bent and humbled with infirmity."

His reply was a good example of the serenity which true faith induces:

"No, ma'am. I have been in my time God's working servant. He has promoted me to be His waiting one. One of these days, when I fall as these pears as falling, He will pick me up."

THE EMPRESS EUGENIE LACES.—The New York custom-house storekeepers have received orders to sell by auction the famous laces that were made for the Empress Eugenie. After the fall of the French empire, the owner brought them to this city in search of a purchaser, and the government confiscated them as smuggled goods. The laces are worth $20,000. One of the pieces is a dress for which the late A. T. Stewart offered $5,000.

Reading for the Young.

WHAT LITTLE TOT DOES.

BY MRS. LORETTA E. TURNER.

Monday I take my little tub,
And fill with soap and water;
And my dollies clothes I rub, rub, rub.
Ma calls me her good daughter.

Tuesday I heat my tiny iron,
And smooth my dollies' dresses;
Dress them up nicely in clean clothes,
And comb their silken tresses.

On Wednesday mama cuts some work
And I sew it neat and tidy,
And mama comes and kisses me
And says I'm a little lady.

Thursday I to the kitchen go,
Help mama do the baking;
And bread or cake, or pies or tarts,—
I make what she is making.

Friday I give my dolls a feast,
Then take them all out walking;
You'd laugh to hear the funny things
They say when they are talking.

Saturday we have a merry time,
Some game or merry frolic,
Unless a dolly is taken sick
With toothache or the colic.

Sunday I read some little book
Until the bells are ringing,
With mama go to church and hear
The sermon and the singing.

No. Fairfield, Ohio.

IMPORTANT!

IT gives us pleasure to announce that in this and subsequent issues the READING FOR THE YOUNG will occupy three full columns, instead of two as has heretofore been the custom. This step has been taken after mature reflection and deliberation, and is due solely to the active and increasing interest taken in this department since the assumption of their editorial duties by the new management. The columns will be under the combined direction of Uncles MARK and TOBE, who will augment rather than relax their efforts to make the department interesting, instructive and alive with topics of contemporaneous interest.

IT is a source of no little pride to the Editors to note the improvement in the tone and style of the letters from our young Cousins, and the gratifying accounts of their progress in educational pursuits. Many note as among their accomplishments a skill in drawing, and it would seem to us that examples of their workmanship would be a very appropriate contribution to these columns. If, therefore, the artistic cousins will kindly mail sketches on paper, *the width of this column*, we will duly consider their merits, and if able productions, have them drawn and engraved on wood and inserted. Do not imagine you are unequal to the task, but send your sketches and permit us to judge of their availability.

IN conclusion, let us hope our young friends will appreciate the spirit of this concession, and redouble their interest in what is intended solely for their edification and improvement. From time to time we promise new features, which will be veritable surprises, and it will be no fault of the gentlemen who have kindly volunteered to devote their services to your interests if this department do not equal in interest that of any publication in the land. Co-operation will secure this end. With best wishes we remain, your sincere friends,

THE EDITORS.

LETTERS FROM BOYS AND GIRLS.

A Cousin has been There!

O NO, am not sorry I went, though it was a most uncomfortable jam. When I thrust my head from the window on the morning of the 10th, the sight of weeping clouds did not deter me, for I had not hurried all the way from the Green Mountains to be defeated in my purpose now by a few showers; so with waterproof and overshoes we were soon standing at the corner waiting for a car, and for aught I know we might have been standing there till this time, for a person felt thankful seven cents worth for the privilege of hooking one toe on a corner of the step, leaving the body hanging out into space. Not caring to assume such a position, as the clouds had cleared away, we trudged on through the crowd and entered the grounds about nine o'clock. Secured an excellent position midway between the Main Building and Memorial Hall, but in half an hour the crowd was so dense there as to endanger life. Fortunately, after a long struggle we escaped to the opposite side of the broad walk, then being but a few feet from the cavalcade of invited guests. But for the constant chatter of the crowd the words of Bishop SIMPSON'S prayer might have been understood at our distance, as his deep, full voice reached us. Then attention was again directed to THEODORE THOMAS, who wielded the baton in a decidedly expressive manner, seeming to impart action to the thousand singers following his motions in such perfect accord. The solo of MYRON WHITNEY was—to say the least—grand. I was agreeably surprised at the appearance of Dom PEDRO. He looks like a man of sterling worth, was dressed plainly and greeted friends with an easy self-possession. The Empress is a small, plain-looking lady, but with a genial smile that softens the features. But few were allowed to follow the President and party to Machinery Hall. We were among the fortunate number, having a commanding position near the huge engine and where we could distinguish the movements of the party. Mr. COULISS explained to the President and Emperor the movement of the handles, and the instant they turned them we could hear the steam starting on its long, rapid journey, and the huge, powerful machine began its labors amid excited cheering of the spectators. Think of the strong arms of that one machine controlling all the rest in that huge building. Didn't I long to be a boy for about three seconds to throw up my cap and hurrah! After that a portion of the party made its way to the Women's Pavilion, where the Empress started the machinery in that building; the remainder scattered about the grounds without further restraint. There is much to be seen at every step one takes; but as I am expecting to visit the buildings occasionally, if it will be of interest to the RURAL readers I will wear my thinking-cap and on my return home try to recall some things observed.—C. ESTELLE P.

The True Dignity of Labor.

READING occasionally articles by various writers on the "Farm Boy Question," I thought I would give my opinion on this subject, based upon experience. It is plain to see that these gentlemen never experienced real farm work, and therefore know nothing of our troubles. Such insinuations as "Be happy, boys," and "Be proud that you can do dirty work," and that you have the unlimited privilege of being out in the scorching sun all day hoeing or plowing, and occasionally getting a kick from an ox or a prod of his horns, and other flattering remarks are volunteered freely. The most of us, I am certain, look upon this as empty talk, and the effects of such *animations* are, that a great many grow up conceited and presumptious over nothing but merely having the honor of being a hard-working farmer's boy. My object is to try and lift off this stone of *solicitude*, by relating how I obliterated my troubles and became contented.

A year ago I used to apologize, as Prof. M. M. BALDWIN calls it, at every opportunity, for having taken to the gardener's trade, and thought if I only lived in a city I would be admitted into good society, i. e., fashionable society, and so enjoy life. Occasionally meeting my schoolmates—some in a store as clerks, others studying law, and I a gardener—would increase my troubles fifty per cent., and at last it came to an explosion. I was persuaded to attend the "Commercial College" in our city, to acquire a practical business education, which would *involuntarily* place me into a responsible financial position; but soon found out that this branch of science was too well taken care of, so I gradually calmed down and saw that I had been much better off than a great many bookkeepers, and quietly resumed my position as apprentice. Now let me tell you where we make the mistake. The majority of us young gardeners and farmers are alone to blame for not being happy; this desire of being admitted into intelligent company is the principal cause. I know we imagine that farmers and gardeners are nowhere admitted into fashionable society, which is the fact; but they and we can shine in society as well as men of other professions, if we only possess the required education. Manners and more than ordinary education are the passwords of such societies. If we possess these we need not apologize. Now I could associate with those young ladies and gentlemen who once were the cause of all my troubles, but I give my botany lessons and landscape drawing the preference. I never feel so contented as when engaged in them. Devote your leisure time to something scientific, and strive rather to be numbered among the prominent men of *our* time; *then* society will open its doors to receive you, and feel honored if they can say they had you (once a farmer's boy) to tea.—R. C. P., *Po'keepsie, N. Y.*

[WE cordially give our young friend an opportunity to ventilate his opinions, and the *peculiar* nouns and adjectives with which he graces his communication. Has the other side anything to say on the subject?—ED.]

City Living and City Thinking.

A GREAT weakness in people of large cities is their extravagant vanity and squeamish avoidance of anything pertaining to the "rude and unrefined" customs of rural life; and it is therefore not surprising to note among the great masses of metropolitan youth how few are acquainted with the blessings of Nature's world or the advantages of country living. I am an exception among the young of "Babylon" who addresses himself to the important subject of "Rural Life," and naturally have come to favor it, while I abhor the life of misery and vice a metropolitan existence is heir to. I am also quite an observer and rather "old fashioned" for my age. Indeed all are, however puerile, in this great city, or they "could not earn their salt." Shrewdness and tact are the jewels that accomplish it all. I have learned by being thus observing that flattery, falsehood and trickery constitute the basis of business and society among promiscuous multitudes; that the public punishes with a hand of iron the very crimes which it furnishes, and that indiscreet childhood follows fast in the actions of its older society, and is too often led to the goal of destruction.

In learning thoroughly to hate city life I have infinitely learned to love God's country. Wise men have learned to do so before me. CINCINNATUS relinquished a life of luxury and ease for his humble farm and plow. WASHINGTON rightly believed "agriculture to be the noblest work of man:" and GREELEY defended rural life with all the vigor of his pulssant pen. My anticipation of a noble rural life has endowed me with strength to bear up under present miseries and delights my young imagination with lovely visions. Ah! how oft have I wished for the eloquence of a DEMOSTHENES to praise it beyond all subjects next to

the greatness and mercy of JESUS! Inglorious indeed are they who cannot love GOD's country and learn love, peace and harmony from its abundance of works. The graceful L. MARIA CHILD has said: "I have sometimes thought that flowers were the alphabet of angels, wherewith they write mysterious truths on hills and fields, in a cipher which mortals are too dull to apprehend." Have you not thought so too, dear reader?

I could say much and never tire in praise of my darling theme. I could tell you how much greatness the shady vale and verdant river side has fostered, had it not been told before in language as eloquent and sublime as GOD's thunder-voice speaks to the Red man of the prairies. So I will only add, never be eager to mingle in metropolitan life, but remember in your prayers the miseries and foot-falls in the uncertain path of your city cousins.—W. C., *New York City.*

From Mademoiselle.

MR. EDITOR:—Will you please introduce me to the Cousins of the RURAL? Happy to make your acquaintance. Grandfather takes your paper this year and I have fallen quite in love with it. First I will tell you about my home, a pleasant one. I live on the bank of a stream whose waters are "Black." In the summer there are four small steamers which pass quite often, and as I write I hear the whistle of the locomotive as it comes thundering into the station. I admire flowers and cultivate them. Among those which I most admire are the heartsease and rose. I would say in behalf of N. K. that I think that YOUNG PENNSYLVANIAN very impertinent, and I think that we, as Cousins (should I become one), ought not to insinuate that the other tells an untruth, until we know it to be so. I will admit that A. R. M. is right in regard to girls' tongues being hung in the middle; but, Sir, is it more than right that Providence should provide a way for us to keep even with the opposite sex? If I could have a chat with him perhaps he could write more on the subject of tongues. Perhaps you would like to know how many years I have seen. Am not under nine or over sixteen. I can say one thing certain—I never saw a Centennial year before. I am also learning to draw. Some people are foolish enough to flatter me (as well as Y. A.) by telling me I have a talent for it, and I one day hope to reach the acme of that art. If the Editor is kind enough to print this, the Cousins may get another letter from—MADEMOISELLE GERALDINE.

From Cousin Nellie.

DEAR RURAL:—I was surprised and very much pleased to receive the plant you sent me last week. I think it beautiful and wish to thank you for it many times, as also for your kind wishes in the RURAL. Yours—NELLIE WOOD, *Fair Haven, Vt., July* 31, 1876.

[MISS WOOD answered successfully question in RURAL, June 17.—ED.]

The Puzzler.

TENNYSONIAN ENIGMA.

I AM composed of 93 letters:

My 11, 93, 66, 22, 89, 19 "the lily maid of Astolat."

My 92, 59, 37, 45, 7, 48, 82, 37, 16, 77, 31, 12, 2, 38 a celebrated English poet.

My 9, 40, 60, 3, 52, 68, 5, 84, 33, 17, 21, 87, 4, 63, 58, 49, 88, 14 a poem by the author of "Idyls of the King."

My 70, 78, 44, 77, 23, 47, 83, 72, 39 a knight of the "Round Table."

My 13, 53, 85, 79, 65, 28, 91, 17, 69, 80, 87, 61, 10, 54, 55, 46, 17, 49, 57, 48, 86, 50, 17, 28, 8, 69 a famous poem.

My 51, 76, 20, 27, 56, 38 was a magician.

My 59, 41, 62, 71, 15, 17, 63, 32, 89 the "King of Camellard.

My 1, 52, 81, 22, 73, 90, 25, 38, 24, 82, 42, 55, 46, 64, 19, 74 a poem by Alfred Tennyson.

My 9, 18, 60, 29, 56, 38, 67, 21, 35 or "Songs of the Wrens."

My 61, 6, 31, 23, 36, 75 a character in "The Princess."

My 51, 30, 26, 34 "Queen rose in the rosebud garden of girls."

My whole is a selection from Enoch Arden.

☞ Answer in two weeks. EUDORA.

MYTHOLOGICAL ENIGMA.

I AM composed of 39 letters:

My 4, 30, 1, 18, 34, 36, 24, 9, 3, 26 one of the three Graces.

My 6, 14, 38, 33, 24, 12, 2, 24 the wife of Admetus.

My 25, 8, 35, 13, 11, 19, 23 a daughter of Latinus.

My 21, 16, 34, 5, 37, 10, 24 a Phryglan king.

My 17, 2, 25, 32, 36, 15, 30, 24 a son of Laomedon.

My 31, 7, 39, 14, 35, 33 the number of difficult labors imposed upon Hercules.

My 27, 6, 10, 20, 24 Sylvan deities.

My whole is what the nymph Echo did because slighted by Narcissus, whom she loved.

☞ Answer in two weeks. S. C.

SQUARE WORD.

1. A SINGING bird. 2. A tropical plant. 3. A beautiful flower. 4. Part of a ship.

☞ Answer in two weeks. ISOLA.

PUZZLER ANSWERS.—Aug. 5.

MISCELLANEOUS ENIGMA.—"Our doubts are traitors, and make us lose the good we oft might win, by fearing to attempt."

DOUBLE ACROSTIC.—Ethan Allen.

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

HOME NEWS PARAGRAPHS.

ALDERMAN CULLERTON of Chicago, convicted of complicity of whisky frauds, has had his imprisonment remitted. Pardon by the President.

The Canadian Indians are peaceful, and are not joining Field Marshal Bull, as reported.

Says the (Mo.) Reformer: "A Democratic Governor and a big corn crop, both of which Missouri is sure to have this fall, will still keep her in the front rank.

Below is a list of the date of State elections as compiled by the New York Times. It may be useful for reference.

Arkansas will elect State officers on Monday, September 4; Congressmen on Tuesday, November 7.

California will elect Congressmen on Tuesday, November 7. State officers will next be chosen in September, 1879.

Colorado will elect State officers and Congressman on Tuesday, Oct. 10.

Connecticut will elect State officers and Congressmen on Tuesday, Nov. 7.

Delaware will elect Congressman on Tuesday, Nov. 7. State officers will next be elected in Nov., 1878.

Florida will elect State officers and Congressmen on Tuesday, Nov. 7.

Georgia will elect Governor on Wednesday, Oct. 4; Congressmen on Tuesday, Nov. 7.

Illinois will elect State officers and Congressmen on Tuesday, Nov. 7.

Indiana will elect State officers and Congressmen on Tuesday, Oct. 10.

Iowa will elect State officers and Congressmen on Tuesday, Nov. 7.

Kansas will elect State officers and Congressmen on Tuesday, Nov. 7.

Kentucky will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen on the first Monday in August, 1879.

Louisiana will elect State officers and Congressmen on Monday, Nov. 6. Five proposed amendments to the Constitution of the State will be voted upon at the same time.

Maine will elect Governor and Congressmen on Monday, Sept. 11.

Maryland will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1879.

Massachusetts will elect State officers and Congressmen on Tuesday, Nov. 7.

Michigan will elect State officers and Congressmen on Tuesday, Nov. 7. Three proposed amendments to the constitution of the State will be voted upon on the same day.

Minnesota will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1877.

Mississippi will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1877.

Missouri will elect State officers and Congressmen on Tuesday, Nov. 7.

Nebraska will elect State officers and Congressmen on Tuesday, Nov. 7.

Nevada will elect Congressman on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1878.

New Hampshire will elect Governor and Congressmen on Tuesday, March 13, 1877.

New Jersey will elect Congressmen on Tuesday, Nov. 7. State officers will next be elected in Nov., 1877.

New York will elect State officers and Congressmen on Tuesday, Nov. 7. Two proposed amendments to the Constitution of the State will be voted upon the same day.

North Carolina will elect State officers and Congressmen on Tuesday, Nov. 7. Certain proposed amendments to the Constitution of the State will be voted upon on the same day.

Ohio will elect minor State officers and Congressmen on Tuesday, Oct. 10. The regular election for Governor will next occur in Oct., 1877.

Oregon will elect Congressman on Tuesday, November 7. The next election for Governor will occur in June, 1878.

Pennsylvania will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1878.

Rhode Island will elect Congressmen on Tuesday, Nov. 7. State officers on Wednesday, April 4, 1877.

South Carolina will elect State officers and Congressmen on Tuesday, Nov. 7.

Tennessee will elect Governor and Congressmen on Tuesday, Nov. 7.

Texas will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1877.

Vermont will elect State officers and Congressmen Tuesday, Sept. 5.

Virginia will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1877.

West Virginia will elect State officers and Congressmen on Tuesday, Oct. 10.

Wisconsin will elect Congressmen on Tuesday, Nov. 7. State officers will next be chosen in Nov., 1877.

The paper money of the United States has to be renewed once in three years.

The Pennsylvania Railroad and the Adams Express Company are delivering New York papers in Chicago twelve hours in advance of the mail.

It is proposed to make the Nebraska line of the Burlington & Missouri R. R. a branch of the Union Pacific.

It is proposed to sell all the Indian ponies captured, as the best means of solving one difficulty of the Indian question.

They fear an Indian war in Texas.

The jetties at the mouth of the Mississippi have proved successful. Vessels drawing eighteen feet pass through without difficulty.

In the Alabama State election the Democratic ticket was successful.

Numerous examinations have been recently made by the New York Board of Health to test milk fresh from the cow. The evidence is conclusive that milk which falls below the standard has been watered after leaving the dairy.

About three per cent. of the Indian population are now in arms against the Government.

Rice culture in Louisiana employs 30,000 people, on 1,200 plantations; produces a crop worth $3,000,000, and develops business to the extent of $10,000,000.

The fifth annual session of the National Agricultural Congress will be held in the Judges' Pavilion on the Exhibition grounds on Sept. 12, 13, and 14.

A corporation has been formed in the District of Columbia, to be known as the "Woman's National University," for the purpose of affording to women a thorough knowledge of the sciences, divinity, medicine and law, both in theory and practice.

Baltimore is striving hard to outstrip New York and Philadelphia in the exportation of petroleum.

San Francisco is in a panic over small-pox. Over 400 cases were reported last month. The disease has yielded in the East to the stamping-out process, and it is manifest that there is some mismanagement not far from the Golden Gate. At a recent meeting of the Councilmen a physician remarked casually that small-pox patients very frequently strayed into the vaccination wards.

The Centennial Exhibition has entered upon the second half of its term. During the past three months the aggregate attendance, dead-heads excluded, has been nearly two millions. The financial success of the undertaking is already assured. The Exhibition has been excellently managed from first to last, and foreign visitors will return to their homes with increased respect for the Yankee talent of organization.

The first wire of the Brooklyn Bridge will be successfully suspended from tower to tower. The rope is three-quarters of an inch in diameter; it is made of fine chrome steel wire, and is delivered in four coils, each containing 3,000 feet and weighing about 3,150 pounds. Each coil was wound on a large drum four feet in diameter, through which a spindle was passed, and from this the rope was reeled by means of a cable passing over pulleys on the summit of the tower and connected to an engine in the yard. The other sections of the "working rope" will be placed in position in a similar manner, and the ends will then be carried to the Brooklyn anchorage. The rope will be carried across the river early next week and attached to the anchorage on the New York side. There will be a "working rope" at each end of the piers, each forming an endless cable passing around pulleys at both anchorages.

The sentiment in favor of remonetizing silver is growing in Congress.

The following is the text of the proposed amendment to the Constitution:

ARTICLE XVI.

SEC. 1. No State shall make any law respecting an establishment of religion, or prohibiting the free exercise thereof, and no religious test shall be required as a qualification to any office or public trust under any State. No public property, and no public revenue of, nor any loan of credit by or under the authority of the United States, or any State, Territory, district or municipal corporation, shall be appropriated to or made, or used for the support of any school, educational or other institution under the control of any religious or anti-religious sect, organization or denomination, or wherein the particular creed or tenets shall be read or taught in any school or institution supported in whole or in part by such revenue or loan of credit, and no such appropriation or loan of credit shall be made to any religious or anti-religious sect, organization or denomination, or to promote its interests or tenets. This article shall not be construed to prohibit the reading of the Bible in any school or institution, and it shall not have the effect to impair the rights of property already vested.

SEC. 2. Congress shall have power by appropriate legislation to provide for the prevention and punishment of violations of this article.

Prof. Peters has discovered another asteroid.

The sale of Short-Horns owned by George M. Bedford, near Paris, Ky., was attended in Cincinnati by some 1,500 or 2,000 persons. The celebrated bull, Fourteenth Duke of Thorndale, sold for $17,000; another bull sold for $6,000. In all, 21 bulls were sold for $20,205. Forty-eight cows and heifers, and three extra calves, brought $37,640, averaging $788 for females, and about $1,200 for bulls. The prices were not satisfactory to the owner, who stopped the sale when only $300 was bid for Oneida, Duke of Goodness. The owner stated that the sale would proceed when about $1,500 was bid for the animal. About 40 animals were not sold.

James G. Hill of Boston, who has been for two years Assistant Supervising Architect of the Treasury Department, and for several years previous a draughtsman in that bureau, has been appointed Supervising Architect. The appointment is made by the Secretary of the Treasury, and is not subject to confirmation by the Senate.

The series of three races for the possession of the Queen's Cup has been again decided in favor of America. The Madeline, our representative yacht, has beaten the Canadian yacht Countess of Dufferin, her competitor in two of the three races. The first race was over the usual course of the New York Yacht Club, and our yacht was victorious, with something over ten minutes to spare. The second race, twenty miles to windward and return, was even more brilliantly won,—twenty-seven minutes to spare. Even the America, which won the cup twenty-five years ago, outsailed the British yacht, and nearly vanquished the victor. The Countess of Dufferin is of Canadian build, on the American model, and sailed the race with an American crew and sailing master, owing her propelling power to canvass made and fitted in New York.

The Catholic Telegraph contains an article from Archbishop Purcell, addressed to the people of the United States, relative to the attitude of the Catholic Church toward the public school system, in which he declares that the Church has no disposition to interfere with the system.

Speaker Kerr is reported as growing worse.

The jury in the case against Kehoe, chief officer of the Molly Maguire order in Schuylkill County, Pa. and Canning, chief officer of Northumberland County, with six other prominent members of the organization, found them all guilty of assault and battery with intent to kill William Thomas. McHugh, who turned State's evidence, was recommend to the mercy of the court. These same men, with several others, will be put upon trial soon for conspiracy to kill William and Jesse Major at Mahanoy City.

Detachments of the Wheeler expedition are leaving Washington daily for the field. This work of exploration and survey, technically known as the United States geographical surveys west of the 10th meridian, will be carried on during the remainder of the year in New Mexico, Colorado, Nevada and California. The sections of country to be explored are contiguous to "Finished Territory," surveyed by this body or by Clarence King in previous years, and the triangulation will be an extension of systems already completed, to which it will be joined.

FOREIGN NOTES.

THE Turks have captured and burned Gurgusovatz. Saitschar is occupied also. Servia reported to desire peace. The Servia war loan is a failure.

Stanley, the African explorer, has been heard from at last. He is still in the vicinity of Victoria Nyanza, has had innumerable fights with the natives, and is as scientifically pugnacious as ever.

Look out for bad five-dollar bills on the Hampden National Bank of Westfield, Mass.

From all quarters the account of the crops is encouraging. The drouth at the East has done some injury to root crops and vegetables, and the grasshoppers have made bad work of it in Minnesota, but otherwise the outlook is very favorable. If the prospect of war in Europe comes to fruition, the farmers will have reason to remember the Centennial year with gratitude. If there is no war, bread will be cheap, and that will be some consolation, anyhow.

The project of turning the ruins of the baths of Diocletian into a palace of fine arts is strongly opposed by the Vatican.

The Greeks have been called to arms.

The catch of herrings in Annapolis Basin, N. S., is very large this season. Many already have been smoked and shipped.

Gen. Tchernayeff has been superseded in the command of the Servian army.

There are now upward of thirty-six theaters in London.

Turkey and Servia are to fight it out; no mediation is contemplated at present.

Gen. Antitch attacked Dervish Pasha near Slenitza, and after three days' fighting the Turks were defeated.

Ristics, the Servian Premier, is preparing a note to be sent to the Powers, giving an account of the atrocities committed by the Turks in Servia. The latter are accused of mutilating the wounded and of burning villages and carrying petroleum in their knapsacks for the purpose.

Advices from Paris report: "Subscriptions will be opened on the 22d of August for an undertaking, with a capital of $6,600,000, to establish and work a new telegraph cable between Paris and New York. The Government has granted to M. Pouyer-Quertier the right to establish this communication."

President McMahon and wife narrowly escaped a fatal accident during a ride from Versailles to Paris.

The Sultan is better, and his complete recovery considered certain.

The Standard's Berlin special says the Porte has positively declared it is willing to negotiate for peace whenever the Powers are disposed to intervene; but is not willing to agree to an armistice before the entry of the Turks into Belgrade.

The latest news in regard to the Eastern war is comprised in the following dispatches:

RAGUSA, Aug. 12.—Eight thousand Turks landed at Antivari on Thursday, the 10th inst. They were going to Pedegoritza. The Prince on Montenegro has delayed his march toward Slenitza, the point of junction of the Servians, for the purpose of operating against Djelaledin and preventing relief to Moukhtar Pasha.

BELGRADE, Aug. 13.—A bulletin published here denies that the Servian Col. Antitch has retreated, and declares that he maintains his position.

Prince Milan has arrived here from Delegrad.

The Turkish forces attempted on Tuesday last to break through the Servian lines at Javor, but were completely repulsed. Nearly all of them were killed.

Gen. Ranco Olimpics maintains his offensive positions on the Drina. Banja, which has been strongly fortified, is held by Tchernayeff's army, while Col. Becker's army occupies the mountains on the Timok and Morava lines.

It is expected that Prince Milan will proceed in a few days to inspect the army on the Bosnian frontier.

Thirty thousand Bulgarians, principally old men and women, have taken refuge in Servia.

The atrocities committed by the Turks in Bulgaria and Servia are reported as beyond description.

Surgeons and officers are arriving at Belgrade from all countries. One legion of volunteers bearing the name of the Princess Natalie has gone to the seat of war.

Gen. Zach's wound will necessitate amputation.

It is believed a battle is imminent in the neighborhood of Banja.

Gen. Leschjanin, with the bulk of his forces, has taken up a position near Brestowatz.

The Commander-in-Chief of the Servian army has decided not to abandon the Morova valley without a decisive battle.

A Russian lady at Berne, fired a pistol at Prince M. Gortchakoff, the Russian Minister to Switzerland. The Prince escaped unhurt, and the lady was arrested. The attempt is attributed to political motives.

A model office-holder is Peng Yu-ling, Imperial Commissioner of Naval Forces. He is said to make a scrupulous return to the Emperor of China, at the end of every year, of every cent that remains over from his salary after paying the barest necessary expenses. At stated intervals he offers his resignation on the ground that he cannot help seeing official corruption.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 12, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	68,426	Molasses	—
Whisky	2,756	Rice, bbls	247
Corn meal, bbls	3,080	Cut meats, pkgs	7,213
Corn meal, bags	756	Lard, pkgs	8,519
Wheat, bush	425,470	Tobacco, hhds	4,134
Corn, bush	348,050	do. cases	5,290
Oats, bush	326,050	Butter, lkgs	24,000
Rye, bush	700	Cheese, bxs	79,125
Malt, bush	46,570	Cotton, bales	8,034
Barley, bush	—	Rosin	12,450
Beans, bbls	6,400	Spts. turp., bbls	1,825
Grass seed, bush	400	Dried Fruits, pkgs	102
Beef, pkgs	749	Eggs, bbls	7,760
Wool, bales	3,737	Peanuts, bags	800
Hops, bales	470	Leather, sides	69,190
Pork, bbls	1,122	Sugar, hhds	—
Tallow	2,031	Oil cake	5,118

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the loading incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEANS AND PEAS.—Exports of beans past week, 447 bbls.; since Jan. 1st, 39,725 do.; same time last year, 18,769 do. Exports of peas past week, 577 bu.; since Jan. 1st, 470,788 do.; same time last year, 230,110 do. Both medlums and marrows have been quiet; sellers are generally quoting as before. Medlums are not offering freely; the supply is fairly liberal, but many of the best marks are speculatively held. The export of marrows has been small, but sellers look for an early revival of business. Pea beans are dull; no improvement in quality. There is some demand for white kidney. Red are quiet for the moment; recent small though steady sales seem to have stocked purchasers. Crop reports thus far are not favorable for a large yield, and the fact prevents a pressure to sell well-cured lots in store. Limas dull. Canadian peas are very quiet; quotations almost nominal. The low tone for green peas has moved off several round lots; prices still low. Black beans doing better again. We quote:

Beans—Prime pea, $1.20@1.25; fair to good, $1.00@$1.10; prime mediums, $1.05@1.10; fair to good, 80@90c.; poor, 40@50c.; prime marrows, $1.45@1.50; fair to good, $1.25@1.35; prime white kid., $1.20@1.30; other, $1.00@1.10; prime red kidney, $1.40@1.45; other, $1.15@1.25; Limas (Cal.), $2.75@3. Black beans, $1.75@4.00. Peas—Canadian, in bulk and bond, 97@—c.; green, $1.00@1.10; split, ₱ bbl., $6.

BEESWAX.—Small lots of choice have been taken at 33@34c.

BUTTER.—The butter market is running in its usual summer groove—fine qualities leading the sales. A return of hot weather has checked shipments, and the scarcity threatens an advance. The strongest feeling is in pails, but fine State firkins and half tubs, especially the latter, beginning to feel the heaviest effect of a lightly-supplied market. The general trade for State is in a better shape than might have been expected, owing to the accumulation of stock that became unsalable through the severe heat. As it is, the steady export demand for cheap Western has reduced the supply of that grade, and market men who have use for under qualities of stock, are working upon the grades of State that were picked one side. We pay low prices, truly, but with the crop that is yet to come forward, the cleaner the market can be kept from drugging sorts the better it will be for producer and merchant. Western creamery sells close to State.

We quote: Choice pails, 28@30c.; prime, 25@26c.; poor to good, 19@23c.; creamery pails, choice, 28@30c.; good, 26@27c.; sweet cream pails, 22@27c. State firkins, choice, 26@27c.; fair to good, 22@25c.; do. half firkin tubs, choice, 27@28c.; fair to prime, 20@22c.; do. Welsh tubs, choice, 27@28c.; other, 19@21c.; Western creamery, choice, 27@29c.; other, 21@26c.; do. firkins, best, 16@17c.; other, 12@14c.; dairy tubs, choice, 21@23c.; other, 13@15c.; factory choice, 18@20c.; other, 15@17c.

CHEESE.—The warm weather has led a good portion of the supplies to be under line in quality, and for such grades low prices have prevailed. For factories, with the accompanying moderate offerings, better rates have been made. Selling at 9¼@9¾c.; closing at the highest rate.

New 9¼@9¾c. for fine and fancy factory; 7½@8c. for good; 6¾@7¼c. for fair; do., half skimmed, 4@6c.; do., skimmed, 3@4c. State farm dairy, 8½@9c.; good to prime, 7@8c.; fair to good, 6@7c.; Western factory, good and prime, 7@8c.; fair lots, 6@7c.; do. cheddar, choice, 8@8½c.; do. flat, choice, 8¼@8½c. Exports past week, 80,055 boxes.

COTTON.—There is a more general inquiry, and with reports of damage to the crop by worms, prices are higher. Quoted at 12 7-16@12 15-32c. for August; 12 3-16@11 7-32c. for September; 11 13-16@11 27-32c. for October; 11 23-32c. for November; 11 23-32@11¾c. for December; 11 27-32c. for January; 12@12 1-32c. for February; 12 5-32@12 3-16c. for March; 12 5-16@12 11-32c. for April; 12 15-32@12½c. for May; 13⅛@12 21-32c. for June; 12 25-32@12 3-16c. for July.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9 3-16	9 3-16	9 3-16	9 3-16

Good ordinary	9 3-16	Low middling	11⅜
Strict ordinary	10⅛	Middling	11½

DRIED FRUITS.—Small lots of new apples have been received from Virginia, of medium quality only, selling at 5½@7c. for quartered. New pitted cherries bring 11c; otherwise, nothing doing.

Apples—State, sliced, 8@8½c.; do., quarters, 8@8¼c.; Southern sliced, 8@8¾c. for prime; Blackberries, 7@7½. Peeled peaches, good and prime Georgia, 10@12c.; fancy, 13c. unpeeled peaches, new, nominal for halves and for quarters. Plums at 12@14c. Raspberries, 24c. Cherries, 14@14½c.

EGGS.—It has been a quiet week in eggs. A large share of the consumption is cut off by the absent portion of our population, and the cream and pastry trade is not a strong, steady dependence. Prices are lower and pretty liberal receipts, with hot weather, will be apt to further depress them; even Canadian have a wide range, and near points are low. We quote:

Near points, 19@20c.; State and Penn., 18@18½c.; Western, prime, 16½@17c.; do. other, 16@16½c.; Canadian, 15@17c.

ESSENTIAL OILS.—The following are the latest revised quotations:

Oil peppermint, glass, $3.75; do. tin, $3.90; spearmint, glass, $3.50; do. tin, $3.75; wintergreen, $3.80; sassafras, 35c.

FEATHERS.—Quiet. We quote prime live Western geese, 53@55c.; other do., 25@40c.

FLOUR.—There has been a good export demand and prices are higher and strong.

For poor to very choice superfine State, $3.75@4.35; $4.50@4.60 for very common to fair extra do.; $4.65@4.75 for good extra do.; $4.80@5.35 for fancy do., and $5.40@6.50 for very choice extra; $3.75@4.35 for superfine Michigan Indiana, Iowa, &c.; $4.10@4.70 for shipping extra do., the inside price for inferior, and $4.75@5.25 for choice to very fancy extra do.; good to choice white wheat extras at $5.75@6.60; fancy do. $6.75@8.25; winter wheat, good to choice family city mill extras, $6.10@7.15, round-hoop Ohio, $4.55@4.95, and trade brands of do. at $5.00@6.35; St. Louis, $4.75@6.00 for common to fair extra, and $6.15@8.25 for good to very choice; Minnesota "straight" at $5.50@7.15, and patent at $6.50@9.00; unsound stock at from $2.50@5.75; city mills extra at $5.55@5.80; No. 3 at $2.25@3.35.

FRESH FRUITS.—There is a fair display of peaches. Several days during the week we have had an offering of 75 car-loads from Delaware. The larger portion is poor, but some fine varieties begin to show, including York's and Crawford's. New Jersey peaches do not pay for shipment. Peach-growing districts in all parts of the country report a light crop. Apples are overstocking the market, and, as most of them are perishable, prices are very low. Southern grapes are variable in price—many in poor order. California plums sell well for fancy use. Southern slow of sale; the preserving demand is later on. We have seldom watermelons so low. Whortleberries are greatly in excess of the wants of any trade, and hardly pay for cultivation and shipment. Pears are in good supply and easy in price. The market is full of odds and ends in the way of small baskets of fruit, for which there is only a chance sale. Peanuts have declined. We quote:

Apples, Summer Pippin, ₱ bbl., 75c.@$1.25; Red Astrachan, $1@1.50; common, 50@75c. Pears, California Bartlett, ₱ box, $4@5; Southern, fancy, crate, $1.75@2.50; Bell, bbl., $2@2.50; sugar, $1.50; Cooking, $1.20@1.75. Peaches, Del., extra, crate, $1.50@1.75; do., fair to good, 50c.@$1.25; do., baskets, 50c.@$1.25; N. J. premature, 25@50c.; Plums, California, 20 lb. box, $3@5. Whortleberries, ₱ bush., 50c.@$1. Muskmelons, New Jersey, ₱ bbl., $1.50@3. Watermelons, $8@13. Peanuts—Virginia, prime, ₱ bush., $1.70@1.75; Wilmington, $1.50@1.70; common, 90c.@$1.25.

GRAIN.—For wheat, with the warm weather and a good deal of poor stock offering in consequence and light export demand, prices are lower; sales of steamer grades No. 2 Milwaukee spring at 92@95c.; No. 2 Chicago spring, 97c.; prime No. 1 Milwaukee is wholly nominal and Minnesota at $1.15; No. 1 Sheboygan spring, $1.19 for prime afloat and $1.17 delivered; ungraded spring, 85c@$1, the latter price for very good; fair and good red Western at 92@95c. for shipment; very choice new crop amber Indiana at $1.28@1.30. Rye depressed; quoted at 50@65c. for No. 2, 75@78c. for Canada, and 55@75c. for State. Corn is firm and fairly active; latest sales at 53@58½c. for steamer to very choice mill ungraded Western mixed, and in steamer ungraded at 55@55½c. for fair to very good; 57@58c. for New York mixed; 54½c. for New York steamer mixed; 60½c. for New York steamer yellow; 58@58c. for hot and warm; Southern yellow from dock sold at 60@61c.; Southern white in store sold at 61c. Oats are active at 36@37c. for No. 2 Chicago, and 40@41c. for mixed State.

HAY AND STRAW.—Receipts have fallen off, while demand is fair and prices steady.

Bale hay is quoted:—Shipping, 60@65c.; retail qualities 80@90c.; clover, 50@60c.; salt, 55@65c. Straw is quoted at 75@80c. for long rye; 60@65c. for short rye; 50@70c. for oat.

Exports past week 250 bales; since Jan. 1st, 32,015 do.; same time last year, 29,038 do.

HIGHWINES.—Lower; held at $1.11.

HIDES.—There has been a more active inquiry for choice lots, for which prices are higher, with sales at 19@20c. Medium grades are without change. Reports from England are more favorable, but from the Continent unfavorable.

N. Y. State, 19@20c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Oils, all growths, 4@6c.; California (nominal), 15@18c. ₱ lb.

MILK.—Warm weather has improved the demand for milk and prices are working upward. Last week's rates were 75c.@$1.50 per can of 40 quarts. Extra care should now be taken to cool milk well before it leaves the farm. There have been many losses by souring.

POULTRY AND GAME.—Dressed poultry in good order, and that grade is not plenty at this season; quoted as follows: Dry-picked chickens, 18@22c.; scalded, 16@19c.; dry-picked fowls, 16@18c.; scalded, 14@16c.; turkeys, 13@17c.; very few at the latter wanted.

Live fowls and chickens have arrived heavily, and as Western is thin and rough sales are slow. Ducks are firm. New Jersey fowls sell readily at the extreme. We quote spring chicks, near points, 15@16c.; Western, 11@16c.

Fowls, N. J., ₱ lb 11@15c.; do. Western, 11½@12c. Roosters, 7@8c.; Turkeys, N. J. 14@16c.; do. Western, 12@14c.; Ducks, N. J., pair, 75c.@$1; do. Western, 55@70c.; Geese, N. J., $1.75@2.25; do. Western, 1.25@1.50.

Woodcock lower and sell well since they declined. Stall-fed pigeons also easier. State quoted at 85@90c.; Western, 75@87c. Stall-fed pigeons, $1.12@1.25; do. squab, 75@87c.; home live pigeons, ₱ pair, 30c.

PROVISIONS.—Export trade is very light and prices have ruled lower. Mess pork quoted at $19.10 for spot and $19.20@19.25 for August and September. Lincn at 10c. for long clear. Lard at $11@12½ for Western steam on spot and for August; $11.25 for September; $11.32½ for October. Stearine at 11¾@11¾c. for prime Western. Beef hams at $21 for choice Western. Beef at $5@11 for plain mess, $10@12 for extra mess, and $13 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 11@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 30@65c.

TOBACCO.—There has been an active demand and prices are strong.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.
Common lugs	6 @ 6¼	7 @ 8
Good lugs	7½@ 9	8½@ 9½
Low leaf	9½@10½	10 @11

Fine leaf	15 @16	17 @19

SEEDLEAF—CROP OF 1875.

New England tine seconds	12½@11
Fine fillers	6 @ 7½
Seconds and fillers, shipping	5½@ 7
Pennsylvania assorted lots	11 @25
Ohio assorted lots	5½@ 6
Wisconsin assorted lots	3 @ 5

VEGETABLES.—Potatoes have declined under the heavy arrivals from the West. A good many arrive in bad order, showing a great lack of care in barreling. Sweet potatoes are lower; they begin to sell. Tomatoes are scarce and high. Other garden truck lower, with a dull trade. We quote potatoes, ₱ bbl., $2@3; sweet do., $3@5.

Green corn, ₱ 100, 50@75c. Long Island, ₱ bush., $1.25@1.75; New Jersey, do., $1@1.50 ₱ crate. Marrow squash, bbl., $1.75@2; crookneck, $1.50; Wax beans, bag, $1.50@1.75; Cucumbers, L. I., ₱ 100, 30c.; Turnips, Rusia, ₱ bbl., $1.50@1.75. Cabbages, L. I., $3@7 ₱ 100. Potato onions, $1@3 ₱ bbl. Lima beans, ₱ bag, $1@1.50. Egg plant, ₱ 100, $6@8.

WOOL.—There has been a good brisk business on demand from manufacturers, and at the advance of 2c. ₱ lb on Western fleeces and spring California. X and XX Ohio fleeces quoted at 38@40c.; do. State and Western, 33@36c.; combing, 52@55c.; pulled, 30@35c. for super and extra.

ROCHESTER, Aug. 12.—Flour market dull; spring, $6.50; amber winter, $6.75; white winter, $7.00; double extra, $7.25. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.05@1.08; amber winter, $1.05@1.10; white winter, $1.10@1.20. Oats, nominal at 30@33c. Corn quiet at 58@62c. Corn meal, $1.50@1.75. Butter, 19@21c. Cheese, 11@13c. Eggs, 15@16c. Lard, 11@12½c. Apples, bu., 10@50c. Potatoes, bu., 60@75c. Beans, ₱ bu., 50@90c. Mess pork, $20.10. Wool, 20@30c. Hay, $8@11. Straw, $5@8. Timothy seed, $2.30@3.; clover, $9.50@10. Mill feed dull at $12 for shorts, $14 for shipstuffs, and $17 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c.; to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Aug. 12, 1876.

INTENSELY hot weather is again upon us, and the market has been dull and weak. Buyers seemed to have great hesitancy in operating and preferred to take cheese on commission. A considerable amount was shipped in this way. About 500 boxes of farm dairy cheese were on delivery, and sales were made at a range of from 8 to 9¾c., the bulk going at 8½@9c. A large amount of factory cheese was offered, but as far as could be estimated only about 5,000 boxes were sold, the rest going forward on commission. The prices ranged from 8¾c to 9¾c., and nearly a thousand boxes changed hands on private terms, which means that the figures are to be fixed on next market day. Something over 5,500 boxes went at 9c.

The extremely hot weather tells on butter and but little was delivered this week. We quote tubs from farm dairies at 23 to 25c., and creamery at 24 to 26c.

We have recent advices from abroad. Our London correspondent says the extreme heat prevents the delivery of English cheese. American cheese, being in boxes, can be removed without injury. This, coupled with the low price, makes all qualities in good demand. Dutch cheese is dearer. We give quotations as follows:

American, extra fine, 55@56c.; fine, 53@54s.; good, 50@52s.; common and low grades, 36@48s. New English cheddar brings 70@96s.; Wiltshire double, 120@138s.; Cheshire medium, 90@94s.; fine, 78@78s., Scotch, 56@90s. Dutch cheese—Edams, 52@54s.; Gondas, 49@52s.; Derby shape, 54@58s.

Fine butter is scarce and Normandy is open price. Oleomargarine is preferred to secondary sorts. We quote:

Choumels, 130@132s., Corks, 124s.; Dorsels, 110s.; Jersey, 110s.; Frossland, 120s.; American and Canadian, 90@100s. ₱ cwt. Oleomargarine, or artificial butter, is quoted at 60@100s. ₱ cwt., according to the quality.

LIVE STOCK MARKETS.

NEW YORK, Aug. 12, 1876.

RECEIPTS OF LIVE STOCK.

Totals this week	11,512	82	2,807	29,512	19,089
" last week	9,496	83	2,259	25,719	13,011

BEEVES.—Trade in horned cattle opened very slow on Monday last at further fractional reduction on the closing rates of the previous week. There was a heavy run to hand, the quality of which was from poor to coarse and fat. Prices ranged from 8@10½c. ₱ lb.; weights, 5½@9 cwt. The markets closed weak, with several herds unsold. Wednesday, trade very slow; prices, 6¾@10½c. ₱ lb.; weights, 5@9¾ cwt. Thursday, sales slow and few; prices, 5¾@9½c. ₱ lb.; weights, 5@9¾ cwt. Friday the markets closed weak at 8@9½c. ₱ lb.; weights, 5@8¾ cwt. From 51@57 lbs., net, has been allowed; general sales on 53@56 lbs. net. The herds as above quoted were largely composed of grass-fed cattle. These being unfit for slaughter, depressed the markets. Quality ranged from poor to good. The herds direct from the plains sold at 6½@8½c. ₱ lb. Native steers, grass-fed, at 7@8¾c. ₱ lb. Native, do., part corn-fed, at 9@10c. ₱ lb. Grade, do., 10¼@10¾c. ₱ lb. Eleven cents ₱ lb. was given on cehll for a few selected head of corn-fed cattle. Bulls, live weight, sold at $2.70 cwt. Oxen at 8@9c. ₱ lb., net weight.

Comparative Rates.

Quality.	This week. Cents.	Last week. Cents.
Good	11 @	11¼@
Fair	10¾@10¾	10¾@10¾
Poor	9¾@10¼	9¾@10¾
Poorest	8¾@ 9¾	8 @ 9¾
Gen. selling rates	8¾@ 9¾	9¼@10¾

MILCH COWS.—Trade very slow, with one car load of fair quality cows returned to the country to await a better market—cows, calves included, sold at $30@$5 ₱ head. General sales, $50@60. One cow with calf sold at $70.

VEALS AND CALVES.—Smooth quality veals scarce and in fair demand at 8@8½c. ₱ lb., with a few selected head at 9c. ₱ lb. Calves, part grass-fed and part buttermilk-fed, slow of sale at 5@6¼c. ₱ lb., also at $6@8.50 ₱ head. Ordinary quality calves slow, at 5@7c. ₱ lb. State calves sold at 6@7c. ₱ lb. State veals at 7½@8½c. Jersey veals, at 7½@9c. Pennsylvania veals at 7½@8½c.

SHEEP AND LAMBS.—Trade remains moderately firm in sheep, but has fallen off nearly ½c. ₱ lb on lambs. The quality of the flocks to hand has been from coarse to good. Monday last sheep sold at 4@6¼c. ₱ lb., lambs at 6¾@7¾c. Wednesday, sheep, 1¾@6c.; lambs, 6@7½c. Thursday, sheep, 4@6¼c.; lambs, 6½@7½@. Friday, the markets closed dull; sheep, 1@5¾c.; lambs, 5¾@6¾c. State sheep, 4@6¼c.; Kentucky do., 1¾@5c.; Ohio, 4¾@6¼c.; Indiana do., 1¾@5¾c.; Virginia lambs, 6@7¾c; Jersey, 7@7½c.; Missouri, 6¾c.; Ohio, 7@7¾c.; Kentucky, 6¾@7¼c. Two carloads of Colorado sheep, $4.80 ₱ cwt.

HOGS.—No sales of live hogs. City dressed slow on Monday at 8@8¾c. ₱ lb., held at these rates up to Wednesday afternoon and closed on Friday at 7¾@8¼c., trade being inactive.

HORSE MARKET.—City trade remains slow but steady; inferior quality horses are chiefly dealt in; high-priced horses have not been quoted. Forty-two head poor quality light harness horses sold at $55@60 ₱ head, with one animal for $105; 23 ordinary quality, $115@175; 9 coarse quality heavy draft horses, $150@225; 3 pairs do., $400@420 ₱ pair; 11 pairs family carriage horses, $330@600 ₱ pair; 5 head course quality brougham horses, $225@375 ₱ head; city railroad horses, $95@130 ₱ head; stage line horses, $135@195 ₱ head.

THE best way to learn geography now-a-days is to get up a war. It is thus we have learned all about Abyssinia, Khiva, Atchinee, Ashantee, Herzegovina and Servia.

A SKIPPER of a down East coaster, named the Hyena, was recently asked what his vessel was named after. His honest and sober reply was, "I don't know, I expect some great man in Congress."

PROFESSOR—What, can't you translate that passage? You must be very ignorant of the simplest knowledge of Greek. Student—I'm not as ignorant as you—he coughed, and after a pause added—think I am.

INDIAN customs seem to be reaching East. Old-Man-Afraid-of-His-Wife came home late the other night and crawled under the bed, but was persuaded to leave his reservation and become one of the Sore-Heads.

THERE is a man in Denver who can't go swimming on account of a big Newfoundland dog which he owns. The dog keeps a close watch on him, and every time the gentleman takes a plunge in the lake the dog drags him out.

IT is a pitiable sight to see a woman, who but one short year ago possessed an angel's sweetness of disposition and a child's artlessness of character, watching at the head of the stairs at two o'clock in the morning, with a towel-roller in her hand.

"WHAT kind of a picture would you prefer, miss," inquired a Newark photographer of a young lady customer.

"Well," was the reply, "take me with an expression as if I were writing a poem on the Centennial."

A TRAVELER staying over night with a Texan farmer whose estate was miles and miles in extent, said to him:—"You must have begun life very early to accumulate such an estate as this." "Yes," replied the farmer, "I began life when I was a mere baby."

"MRS. SAGE, I should like to know whose ferry-boats these are that I tumbled over in the hall?" "Ferry-boats, indeed, sir! Those are my shoes! Very polite of you to call them ferry-boats!" "Didn't say ferry-boats, Mrs. Sage, you misunderstood me—fairy boots, I said my dear friend."

"Playest thou at croquet?" says the aristocratic maiden at Newport. "Yeth," answers her Polo gallant; "yeth, once in a-while, but its awfully dull after mustangs, you know!" And the maiden told her mamma that he was rude to speak about mustangs in connection with croquet.

A CLERGYMAN who goes in for elegance of paraphrase did a fine thing lately in ringing the changes upon "He that hath ears to hear, let him hear." "He that is accessible to auricular vibration," said he, "let him not close the gates of his tympani." If that isn't hifalutin', then what is?

THE Misses Atwood of Fryeburg, Me., have worked out their highway taxes, handling their hoes with graceful diligence. Their neighbors are said to have been "astonished and amused;" but, in Boston, ladies may be seen every day sweeping the streets with their long dresses, and nobody is entertained or shocked, apparently.

IN Vienna the handsome tenor kissed the soprano; the lady complained, and the management said: Mr. Tenor, behave. The next evening he wanted to kiss her again (in the play) and she said, "I will excuse you from the kiss." He said in revenge, "Thank God for that." The house sat appalled, the soprano waltzed off the stage, and Mr. Tenor is minus one ear and several teeth.

CONSIDERABLE so-called slang is classic. "Escaped with the skin of my teeth" is from Job. "He is a brick" is from Plutarch. That historian tells of a king of Sparta who boasted that this army was the only wall of the city—"and every man is a brick." We call a fair and honest man "a square man," but the Greeks described the same person as *Tetragonos*—"a four-cornered man."

THE Paris papers tell a pleasing story of Mme. Buffet and of Mrs. Augustus Craven, the author of "The Story of a Sister," who, as everybody knows or ought to know, is a French woman. She had sent a copy of her book to Mme. Buffet, who, meeting her shortly afterwards, said to her: "Oh, let me congratulate you on your book; it is charming. The deathbed of your father is really delicious."

THE Sultan's fourth wife is an English shop-girl. Her aunt had a store at Pera, and summoned her niece from England to help her in trade. The girl was pretty and attractive, and soon learned the Turkish language. One day she went to the harem of Prince Murad to deliver some articles which one of his wives had ordered, and she never returned.

No sooner do we hear of the building of a new and apparently impenetrable ironclad than it is followed by an account of a more destructive weapon of offence. After reading the account of the trial of a new American missile which took a splinter off the cheek of a book agent at a hundred rods, we imagine that the English will conclude that their ironclad navy is a miserable failure.—*Boston Commercial Bulletin.*

ADDRESS
RURAL NEW-YORKER,
78 Duane St., New York City.

ANSWERS TO CORRESPONDENTS.

Farm Help and Sundays.—Is the question in order referring to the rights of farm help on Sundays? I would like to ask your opinion on the subject. Is it an established rule among farmers generally to allow help to act their own pleasure on that day, or is it understood that all necessary chores must be attended to as on week days?—E. H. F.

It should be, if it is not, an established rule that farm help must do all necessary chores on Sunday the same as any other day. Cows require to be fed, watered and milked on Sunday the same as any other day of the week, and if it had been intended by their Creator that these operations should not be performed on a certain day, the functions of the animals would have been suspended during the designated period. If a man drives his horses to church, somebody must harness them, and when they return they must be unharnessed and fed, and it makes no difference who performs the task, it is work of a certain kind. Again, we will suppose a man keeps fifty cows and hired help to care for them, would it be reasonable to suppose that the proprietor or some of his family, who may know nothing of caring for such animals, must step in and relieve the hired man on Sunday? Although we, as a Christian community, agree to abstain from unnecessary labor one day in seven, it does not follow that the demands of nature must be neglected. In our own experience with hired help on a farm, we have never had a man refuse to take care of the same animals on Sunday that he had in charge on week days; but where there are several hands kept, they usually arrange to give each other "off days," one doing the usual work of two or three on one Sunday, and his associates doing the same for him in return. But to avoid all misunderstanding upon such points, it is well to make a definite bargain with hired help at the commencement of the season.

Ed. Rural:—On page 113 of the Country Gentleman's Annual Register of Rural Affairs for 1855, J. J. THOMAS says that lightning rods should not be fastened to buildings with glass insulators, but that they should be made of seasoned and painted wood. He says that glass is no protection after it becomes wet, and that the metallic fixtures that fasten it to the building have a tendency to attract the electricity to the building, etc. Now, I have a high house in an exposed situation, as regards lightning, and have just attached my rods by means of glass insulators and zinc staples. This I considered safe, but would like your opinion in RURAL. Is Mr. THOMAS correct?—L. H. BELG.

We have always considered Mr. J. J. THOMAS a very safe counsellor in matters pertaining to the farm and garden, but what he said in the "Annual Register of Rural Affairs" about the lightning rods is in our candid opinion rather against him—not but what his directions for putting up the rods are all right, but we cannot agree with him in regard to the value of lightning rods as a means of protection. We have always considered that a building was a *little* safer without a rod than with it, consequently have never had any experience in their efficacy or as to the best method of insulation. Our best authorities disagree on these points, and we are perfectly willing to let them. You will find on another page an interesting article on lightning rods in general, and how peddlers of this article manage to dispose of their wares.

C.—Will any of your medical subscribers or readers answer the following questions? My motive in asking them will appear when I say that I live in a malarial district and several members of my family have suffered from chills and fever:

How late in the afternoon upon clear days is it considered safe to venture out of doors? Does the malarial poison collect or condense near the earth as soon as, from the loss of the sun's rays, it becomes cooler than the atmosphere? Is it the sun's rays that dissipate the malaria? If so, ought one never to venture out upon cloudy days?

Most of the books I have read upon the subject caution against the evening air. Is not the morning air as dangerous? If not, why not?

REMARKS.—We join with our correspondent in asking information of those who have made such questions a special study. It is one in which every person is in a greater or less degree interested.

In an article by CHARLES P. RUSSEL, M. D., which we shall publish as soon as space permits, we find the following:—"It is most dangerous when the sun is down, and it (the malaria) seems almost inert during the day. It seems almost providential that the same agency which is so potent in its production should be the principal instrument of its destruction. Exposure in the open air after sunset, or until *several hours after sunrise*, should be avoided. It is generally regarded as having a specific gravity heavier than that of air, but this is by no means certain. It is doubtless rendered heavy by combining with night-fogs and dews, but upon their being dissipated by the sun, it rises into the air and probably becomes inocuous by wide diffusion and dilution."

Mary Waley.—When is the best time to start slips of Geraniums, Verbenas, double Feverfew and Fuchsias for winter blooming? ANS. The sooner the better.

Will shore-sand answer to root them in? ANS. Nothing better, if you wash the salt out.

How will it do to start all together in a box and transplant into pots after they are fairly rooted. ANS. It will do very well.

Should plants be started in the house or in open air. ANS. That depends upon the plant. Those above mentioned may be rooted out-of-doors, if sheltered from rain and sun and uniform moisture be provided. We should prefer to manage them in the house.

Will Stocks grow from slips? ANS. Ten-weeks' Stocks are annuals. The Intermediate and Biennial, or Brompton Stocks, will bloom in early spring, if the seed be sown at once and the plants lifted before frost. Cuttings of the last will root—but the plants are never so vigorous and the spikes are short.

I have a bed of seedling verbenas; will they continue to bloom if the roots be removed to the house before frost? ANS. No, they will not amount to anything. Better pot layers that have not bloomed.

Charles Lindsey, Waukegan.—The following recipe for dyeing Grasses and Mosses is a method recommended by the London Journal of Horticulture and adopted in Germany, and is, doubtless, as good as any:—Boil half a pound of alum in four quarts of water, and dissolve half a pound of finely triturated mineral blue in it, and a dark green dye is the result. Or a beautiful green dye may be made with indigo, carmine and picric acid, adding water to reduce it to the desired hue. As picric acid is rarely to be had of uniform strength, the exact proportions cannot be given.

To Dye Black.—Two ounces of logwood in one quart of water, quarter ounce of alum, and three ounces of copperas, the whole boiled together and the moss or grass dipped into it while hot. Or two parts of logwood and one of Ieabano thoroughly boiled together and a little green vitriol.

Red.—The best way to make this color is to boil as much red aniline in rain water as will produce a pretty red. The dye should be hot when the plant is dipped.

C. E. Lindsay.—I have a Portulaca that bears upon the same stem flowers that are all crimson, and others that are crimson striped with pink. They are great curiosities to me. Did you ever see anything of the kind? ANS.—We saw such flowers to-day. We have them also half-crimson, half-white. It is indeed seldom that the variegation is the same in any two flowers.

Of the plants you send to us for name, the one with the bright yellow, Clover-like head is *Polygala lutea*, growing in sandy plains from New Jersey to Florida. The other is *Plantanthera ciliaris*, the yellow-fringed Orchis. This grows mostly in the swamps of Canada and the United States, but it is not common.

Squash Bug.—We have never found anything which would destroy the Squash Bug (*Coreus tristis*) without injuring the vines. Paris green, as applied to potatoes for killing the Colorado potato beetle, will kill the bugs, but one does not like to apply such poison to squashes that are to be used for food. Carbolic acid has also been recommended for this purpose, but not having had occasion to use it, we cannot speak from experience as to its efficacy. Our Eastern agriculturists say that lime slaked in water impregnated with carbolic acid is certain death to all such insects, and we give the recipe for all it is worth.

L. M. W.—We have seen samples of the paper barrels to which you refer, but do not know the price, or where they can be had. If they are of any practical use and can be made cheaper than wooden barrels, we should think the manufacturer would advertise them.

Horseman.—The latest and probably the best work issued in this country on the treatment of the diseases of domestic animals is that of Prof. JAMES LAW of Cornell University, entitled "The Farmer's Veterinary Adviser."

J. T. H. Brady.—Please give the botanical name of the sweet little shrub inclosed. I have cultivated it over 50 years under the name of Lemon Verbena.

ANS.—It is Aloysia y citriodora.

Wire Fence.—CALKINS BROS. of Chicago, Ill., keep the wire fencing for sale, but we do not think they have an agency in this city, at least no notice of one has been sent to this office.

Rural Reader.—Accept our thanks for sending other specimens.

It is *Polygala polygama.*

A Subscriber.—Address R. H. ALLEN & Co., Nos. 189 and 191 Water Street, N. Y., for farm boilers or steaming apparatus.

Trees, Seeds, Plants, &c.

HEIKES NURSERIES.

We offer to the trade for fall of 1876, a large stock, especially in the following:

Apples, including Tetofski and Murengo, Plums, Peaches, Cherries, Currants, Wild Goose Plums, Gooseberries, Raspberries, Strawberries, etc.

We are prepared to offer inducements, and solicit correspondence.

THE HEIKES NURSERIES CO., Dayton, O.

NURSERY STOCK.

We offer to the fall and spring trade of first-class stock:

	P 100.	P 1,000.
150,000 3 & 4 yrs. Apple Trees	$10 00	$70 00
5,000 3 & 4 yrs. Standard Pear	30 00	280 00
10,000 2 & 3 yrs. Standard Pear	25 00	250 00
5,000 3 yrs. Dwarf Pear	18 00	160 00
25,000 2 yrs. Dwarf Pear	16 00	150 00
35,000 2 yrs. Cherry, largely E. May	16 00	150 00
10,000 1 yr. Peach	8 00	60 00
10,000 2 & 3 yrs. Grape Vines, in variety		
40,000 1 yr. Grape Vines, in variety		
10,000 Evergreens, in variety		

Also a large stock of Small Fruits, Roses, &c. We solicit the attention and correspondence of all persons who are in want of first-class stock.

August, 1876. MOORE, HEMM & CO., Sidney, Ohio.

CALIFORNIA.

Have you any thought of going to California?

Are you going West, North or Northwest?

You want to know the best routes to take?

The shortest, safest, quickest and most comfortable routes are those owned by the Chicago and North-Western Railway Company. It owns over two thousand miles of the best road there is in the country. Ask any ticket agent to show you its maps and time cards. All ticket agents can sell you through tickets by this route. Buy your tickets via the CHICAGO & NORTHWESTERN RAILWAY for San Francisco, Sacramento, Ogden, Salt Lake City, Cheyenne, Denver, Omaha, Lincoln, Council Bluffs, Yankton, Sioux City, Dubuque, Winona, St. Paul, Duluth, Marquette, Green Bay, Oskosh, Madison, Milwaukee, and all points west or northwest of Chicago. If you wish the best traveling accommodations, you will buy your tickets by this route, and will take no other.

This popular route is unsurpassed for Speed, Comfort and Safety. The Smooth, Well-Ballasted and Perfect Track of Steel Rails, Westinghouse Air Brakes, Miller's Safety Platform and Couplers, the celebrated Pullman Palace Sleeping Cars, the Perfect Telegraph System of Moving Trains, the regularity with which they run, the admirable arrangement for running Through Cars from Chicago to all points West, North and Northwest, secures to passengers all the COMFORTS IN MODERN RAILWAY TRAVELING. *Pullman Palace Cars* are run on all trains of this road.

This is the ONLY LINE running these cars between Chicago and St. Paul or Chicago and Milwaukee. At Omaha our sleepers connect with the Overland Sleepers on the Union Pacific Railroad for all points west of the Missouri River.

For rates or information not attainable from your home ticket agents, apply to

MARVIN HUGHITT, Gen'l Superintendent. W. H. STENNETT, Gen'l Passen'r Agt.

THE PALACE HOTEL TRAIN

BETWEEN

NEW YORK AND CHICAGO,

via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York.

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only line running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend as a present, at our lowest club rate—only $2.15, including postage.

MOORE'S RURAL NEW-YORKER.—With its full corps of editors, and a new publisher of energy and ability, the management propose to celebrate the quarter-centennial of the pioneer RURAL in such a manner as to augment its popularity and usefulness. For a first-class, lively paper, containing matter of interest for all classes, take the RURAL NEW-YORKER, and do so at once, for the paper never was better, and its prospects never brighter.—*Freeport (Ill.) Journal.*

Wit and Humor.

THE COLOR QUESTION.

"Midas am you notesin' de strong hole what cullur am takin' an de conjections ob the publik mind?"

"Can't say dat I 'zactly 'preciates what you was conferrin' to Pete."

"Midas you hab 'lowed the interes' ob yoh miud to res' pon de sto' windows; hab you not?"

"I has ruminated pon de dry goods windows; yes Peto, but what am you 'proachin'?"

"Well, Midas, I will commence wid de lowes' one of dem tings an' 'luminate de fac.' You am aware that stockin's am de lowest of dry goods, an' dat's whar I gits the logic. You 'member dat de prevyus question was in favor ob white as de color. By stickin' pins in yoh meni'ry you 'rives at de pint when de public mind am waverin' on de subjec', an' dey put color in de heel an' toe; by reflectin' on de sto' windows you finds dat stripes am de fav'rite by a largo majority. You follows de conflecksbuns ob de young folks ob de country an' you finds dat solid color rules. Dem's de sentiments ob de risin' generations, an' de questions am, won't de next President be a cullud puson?"

SUDDEN SPREAD OF THE GOSPEL.

There was no preaching in this town last Sunday, and all in consequence of a practical joke perpetrated by a lively young girl. The young girl, inspired by the world, the flesh and a little devil, mixed, sat down, late on Saturday evening, and sent a note to each of the pastors. The missives were on tinted paper and written nicely. They each contained these words:—"All is discovered—fly." Nine of the proachers fled to St. Louis, and three went West. There is a sensation in town larger than a man's hand.

SPARKS AND SPLINTERS.

A pickpocket works on abstract prineiplos.

A fiendish act—The demon-etization of silver.

Old age appears to overtake a fast man soonest.

When the heat increases, the thermometer rises to oxplain.

Accommodating a friend with a fifty dollar note is an ex-L-hnt way of getting rid of money.

At a recent dinner of shoemakers, the following toast was given:—"May we have all the women to shoe and the men to boot."

One fellow when he saw a female woman step into the Buffalo ear, said they'd better change its name to Shecargo. The wretch!

A Georgia colored man has indulged in but twenty minutes sleep per night for the last 5 years and the poultry in that neighborhood are in the same fix.

A man called on a dilatory debter, and politely said:—"If you pay me the amonnt of your bill immediately, you'll oblige me; if not, I shall have to oblige yon."

It is just as hard work to get any kindling wood split as it ever was; bnt over sixty young men of Rome are ready to go West and avenge the death of Custer.

Won't there be fun after the Indian war is over and Sitting Bull takes a turn around among the newspaper offices to find out who wrote those articles!

An Optical Illusion—A chandler having had some candles stolen, a person bid him bo of good cheer, "for in a short time," said he "I am confident they will all come to light."

"It was pitched without," said the clergyman, and an old base-ball player who had been calmly slumbering awoke with a start and yelled "foul." The first bass came down from the ehoir and put him out.

A fashion exchange says that "the jabon is now generally used by married ladies." This would indicate that a harmless but incorrect method of spelling jawbone is now prevalent in polito society.

Wasn't it rough, on Ella, just as she was telling Frederick, at lunch, how ethereal her appetite was, to have the cook bawl out, "Say, will ye have yer pork and greens now, or wait till yer feller's gone?"

If an old woman in a red cloak were to overtake a fierce ram in a narrow lane, what transformation would take place? Tho ram would turn to butter (butt her), and the old woman into a scarlet runner.

"Where's the bar?" asked a dirty-looking stranger of tho bell-boy of a hotel the other day. "What kind of a bar?" asked the latter. "Why, a saloon bar, of course; what do you suppose I mean? "Well," drawled the boy, "I didn't know but you might mean a bar of soap!"

YOUNG AMERICA'S IDEAS OF SELF-MADE MEN.

Johnnie.—"I say, mother, thought you said Uncle George was a self-made man?"

Mother.—"Yes, I did; but why do you ask?"

Johnnie.—"Well, I thought he ought to have made more hair on his head, that's all." (Sensation.)

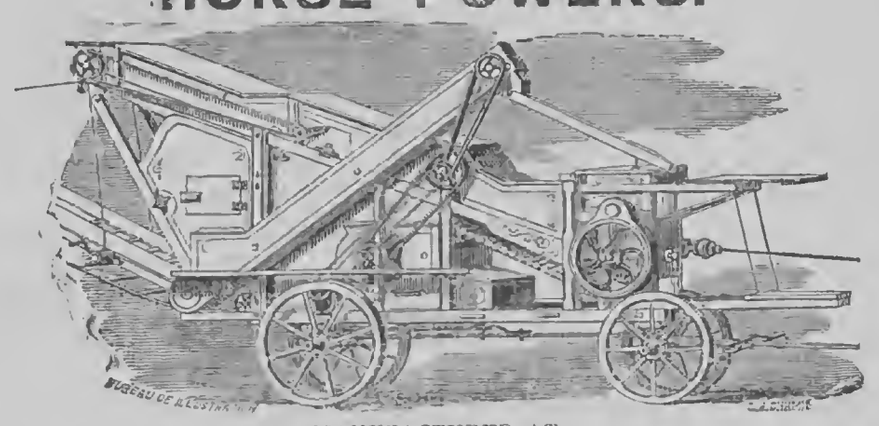
The Buffalo Pitts Threshers
AND
HORSE POWERS.



MANUFACTURED AT
The Pitts Agricultural Works, Buffalo, N. Y.,
Have been known throughout the United States for over thirty years as the
MOST PERFECT AND LIGHTEST-RUNNING THRESHERS
in the world.
FOR THE HARVEST OF 1876

I am offering a large assortment of these **Celebrated and Popular Machines**, adapted to either **Steam, Water or Horse Power.**

They combine all the latest improvements which are to be found in other threshers, and some which are found in the Buffalo Pitts alone.

They are built under the direct supervision of Practical Threshermen (who have followed threshing as a business), and all changes made are the suggestions of experience in the field, and are thoroughly tested there before adoption.

Threshers will appreciate the great advantage of this over

Theoretical Threshing Machine Building.

The greatest care is given to using the very *best material* and to having the work done in the *most thorough* manner.

My facilities for purchasing materials at lowest figures and for economical building are surpassed by none and the machines are offered at the lowest prices at which

The Best Material, put up in the Best Manner, can be Afforded.

In comparing prices Threshers will please note differences in material, workmanship and finish and bear in mind that

The Best is the Cheapest in the end, even though the first cost is greater.

Various sizes are made:—24-in., 28-in., 32-in., and 36-in. Cylinder Threshers and 4-horse, 8-horse, 10-horse and 12-Horse Powers.

Repairs are for sale in almost every county in the wheat-growing country, *at my list price.* For Catalogues, Prices, &c., &c., address

JAMES BRAYLEY, Buffalo, N. Y.,
or 44 South Canal St., Chicago, Ill.

Moore's Rural New-Yorker became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Moore's Rural New-Yorker is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lawn of Life.*

Moore's Rural New-Yorker contains Sixteen Quarto Pages weekly, finely and profusely Illustrated and neatly printed. Only $2.65 per year, $2.15 in clubs of ten or more, postage paid. Great Inducements to Club Agents. Specimens, Premium Lists, &c., sent free.

Horticultural.

NEW AND OLD RASPBERRIES.

It is said that all strawberries are *good*, but some are a little better than others. And the same may be said of raspberries. Of course we speak for the majority in expressing this opinion, for there are persons who cannot see, or taste, any good in either of these extensively cultivated and almost universally admired fruits. But what most interests the majority of those who have gardens, is to know which are the best varieties now in cultivation. This, however, is a difficult question to answer, inasmuch as the best for one locality and climate may not be the best for another. In addition to this variation in adaptation of varieties to localities there is a wide difference of opinion in regard to quality, which may be attributed to individual tastes. One person seeks sweet fruits, another acid, while a third delights in a musky flavor of certain kinds, consequently it requires just the wide range found in nature to suit all tastes. But the adaptation of varieties to climate and soils, is a serious barrier to the wide distribution and cultivation of many kinds of fruits, and with none is it more apparent than with the raspberry. The wild species are found over a very wide range of country, but generally most abundant in situations protected from severe cold in winter and the hot scorching rays of the sun in summer.

Our horticulturists have been raising new varieties of the raspberry for the past century or more, vainly endeavoring to produce one in which are combined all the valuable properties belonging to this fruit; and while much progress has been made towards the production of such a a sort, still it has not as yet appeared among us. Very excellent varieties we certainly have in abundance, among which sorts are found adapted to almost all soils and climates, hence few persons owning gardens and desiring to cultivate raspberries need fear a failure if a proper selection be made.

The ordinary farmer who, perhaps, does not possess the skill of the experienced horticulturists in cultivating fruits, or has not the time to spare for giving the best and most careful attention to his plants, will succeed best with our hardy native varieties, and while they may not be quite as large, or possess, in every instance, the exquisite flavor of the foreign they will, as a rule, give the best satisfaction.

The black-caps, as they are termed, are not only very hardy and prolific, but succeed in a variety of soils and over a wider range of climate than the red sorts. They thrive in the extreme Southern States, where it is next to impossible to keep a variety of our wild red raspberry, (*Rubus strigosus*), alive. The canes, also, are so very hardy that they grow throughout the entire Northern States and in the Canadas.

There is, perhaps, some choice in the different varieties, but the Doolittle, Large Miami or McCormick, (now called by some Mammoth Cluster), known twenty or more years ago, have no superiors among the latest introductions. Surprise, Seneca, Fay's and Davison's Thornless are excellent and well-known varieties. The yellow-caps are ornamental and of fair quality, but none of them are as good or valuable as the blacks.

NATIVE RED VARIETIES.

We have tested upon our grounds nearly everything offered to the public in the way of native red raspberries, therefore can speak from experience as to their merits.

The *Kirtland*, which was one of the first of our native sorts cultivated for market purposes, is still a favorite with many on account of its earliness, firmness, good flavor and brilliant color. The berries are rather small, however, to successfully compete in market with the foreign sorts, but elsewhere it will probably always command a ready sale at remunerative prices.

Wilmington, also called by the Indian name, *Susquco*, is another native sort long known to cultivators of small fruits in the Eastern States. The berries of good size, globular, firm, bright color and good flavor. The plants are somewhat dwarfish in habit, and unless the ground among them is covered with some kind of mulch in summer the berries are liable to get splashed with mud during heavy rains. The canes are very hardy and seldom sustain injury during our coldest winters.

Turner.—This is a variety of recent introduction, and said to be very popular among the fruit growers of the Western States. It is certainly one of the most vigorous and productive sorts in cultivation, but with us the fruit is not as firm as the *Wilmington* or *Kirtland*, although as large as the former and about equal to it in flavor. It will doubtless become a popular sort in the North-west, if not in the East.

Cuthbert.—This is a new and promising variety, but we have not tested it sufficiently to speak positively as to its merits.

Elm City, *Stoever*, *Allen's Red Prolific* and *Bristol* are old sorts which have been discarded by a majority of our fruit growers. A few, however, hold on to the first and think it worthy of cultivation.

Herstine.—This is, we believe, the only one of some four or five promising sorts known as the Herstine Seedlings, which has gained even a slight local reputation. The Herstine Seedlings were supposed to be pure native sorts, or at most but slightly tinctured with foreign blood, but unfortunately those described and disseminated show more of the *Rubus Idæus* characteristics than of the *R. strigosus*. This is especially the case in the one bearing the name of their originators, viz., the *Herstine*. It is, however, a handsome variety and valued highly by many cultivators. The accompanying illustration of a branch loaded with fruit was drawn from life and fairly represents this variety in both form and size. Some of our raspberry culturists report the *Herstine* perfectly hardy as far North as Central and Western New York; others consider it tender even in much warmer latitudes; but all this difference may arise from the soil in which the plants are growing, or the care bestowed, for it is a well-known fact that a vigorous late growth in a raspberry cane increases its chances of passing safely through the winter. This is a peculiarity of the raspberry which applies to but few other plants, for with most kinds we look for a full ripening of the wood in order to insure hardiness.

THE HERSTINE RASPBERRY.

Field Crops.

TOBACCO CULTURE.

DEAR RURAL:—It is in the Valley of the Connecticut River, through both Connecticut and Massachusetts, that most of the tobacco known as Connecticut Seedleaf is grown. Hereabouts that raised on the eastern side of the river is, as a rule, of finer leaf and lighter color than that which is grown on the western side, varying as does the soil; for it is a maxim with tobacco growers that as is the color of the soil so is the color of the crop, and a quite light, sandy soil, well enriched, gives the best results.

There are probably 150 acres of tobacco, rather more than less, grown in this town, in lots varying in size from a few square rods to six or seven acres. The plants are raised from seed sown early in the spring in beds properly prepared for the purpose, and from which they are transplanted to the field.

If the place selected for tobacco culture be in grass, it is usually, but not necessarily, plowed in the fall, and replowed and thoroughly harrowed in the spring. For the best results the soil should be plowed deep, well pulverized and properly prepared with barn-yard manure, the quantity limited only by the supply, thoroughly mixed therewith by plow and harrow. When the land is moderately rich and manure is scarce, it is sometimes the practice to apply it in furrows, which, being covered, establish the places for rows. Guano and prepared fertilizers are sometimes used to advantage, but barn-yard manure is preferred.

When the plants have leaves about as large as a silver dollar they are fit for setting, and usually between the 10th and 20th of June rows are prepared in the field by throwing up light furrows three feet and a half apart, on which the plants are set two or two and a half feet apart in the rows, giving five or six thousand plants to an acre. The plants should not be allowed to dry at all after taking from the seed bed, and some think it best to keep them in water until they are set in the ground. All prefer to set them when the ground is moist, and unless immediate and frequent showers occur, it is necessary to water them occasionally until root growth is established. Such plants as fail to grow, or, after starting, are eaten by the cut-worm, which is the first enemy to attack them, are re-set. Weeds must be kept down, and more labor is expended in keeping the ground clean and loose than for any other crop.

The tobacco worm commences his ravages when the plant is about half grown, and requires direct and personal attention. He seems proof against all poisonous or offensive applications, and no wonder. If he can thrive on tobacco, the nastiest of all growing things, how can it be expected that he will succumb to anything else? The only effectual treatment in his case is with the fingers and foot. A sudden and violent death is his fate. And we can but mourn for him when we remember that, repulsive as he is in form and feature, if left to carry out his natural instincts, he might rid the world of an abomination. It is said that this worm and man are the only creatures that will eat tobacco. We can forgive the worm, for it is his nature. Man with much difficulty acquires what King JAMES very properly called "the damning, wicked practice," and ought to be ashamed of himself.

In six or eight weeks after setting, with a favorable season, the flower buds appear, the stalks having attained a growth of six or seven feet. The plants are then "topped" by breaking them off at about half their hight. By this the whole strength of the plants, much of which, without topping, would go to perfect the seed, is thrown into the portion that is left. The leaves rapidly increase in size, and from their axils side branches, called suckers, immediately start. These are not allowed to grow, however, no matter how persistently they attempt it.

In about ten weeks from setting the tobacco will begin to ripen. Experience and judgment are required to determine just when to cut it. This is best done with a saw prepared for the purpose, and with which the stalk, often more than two inches in diameter, is severed close to the ground at one stroke. The plant is allowed to fall on the ground to wilt, which seems to toughen the leaves so that they can be handled without breaking. If cut at midday a hot sun will burn and completely spoil them before they can wilt. After wilting they are taken to the barn or shed and suspended by the buts, at such distances as will admit of a proper circulation of air, until cured.

Several methods of hanging are practiced. Some place the plants alternately on either side of a pole, holding them in their places by tying twine around the buts and over the pole; others string them on thin board or lath, which is passed through the buts, or have hooks inserted in lath on which to hang the plants. When lath are used, it is sometimes the practice to hang the plants in the field on temporary frames for several hours, or if the weather permits, for a day or two, that they may wilt as much as possible before taken to the shed.

After several weeks the evaporation of the water will have left the leaf thin and silky and the leaf stem hard. Then, when the atmosphere is in such a state of humidity as to give the leaf sufficient dampness and consequent pliability, that it may be handled without breaking, the plants are taken down and laid in piles, buts outward and tips overlapping, to await a convenient time for "stripping." This is done by taking the plant by the but in one hand and picking off the leaves with the other. When a handful or a "hand" is gathered, the leaves are fastened together by winding one about the buts of the rest. Either when stripping or afterward, and before putting into hands, the leaves are sorted into wrappers, seconds and fillers, and are valuable in the succession as named.

The hands are packed in boxes of convenient size to handle, in which they go through a process known as "sweating," during which the hands seem to approach putrefaction, but finally dry out again, and are thinner and more silky than before. They are then ready for the manufacturer.

Most of the crop raised here is sold after stripping to packers, but some prefer to sweat their own crop.

Probably there is no other crop that increases in weight so much in so short a time as tobacco. Plants whose entire growth occupies only about ten weeks after setting often weigh eight or ten pounds, with leaves measuring from 36 to 40 inches in length and 20 to 24 in width, and exceptional leaves are often found very much larger. It is evident, therefore, that it must be very exhaustive to the soil, and perhaps if its culture should be long continued on the same ground it would impoverish it. But the experience of the last forty years in this vicinity shows no such result, but rather that, with proper rotation, it is not injurious. The absolute necessity of manure for its production is an incentive to the farmer, and hundreds of tons more are made each year than would be but for this necessity. Many ditches are cleaned out, hummocks cut off, weeds and coarse grasses gathered, all of which go to increase the manure heap, and more stock is fed than would be if no tobacco was raised. No manure, no tobacco; no tobacco, no money crop, are here well understood facts. That tobacco draws largely on the potash in the soil cannot be denied, but there are other constituents of which it uses sparingly. It scarcely touches lime.

This is not a wheat-growing region, but in instances where wheat has succeeded tobacco nearly or quite as good a crop is made as would be expected from the same soil and preparation had no tobacco been first raised. Grass is often sown after tobacco, and a strong sod with good crops for years thereafter attest that tobacco does not take all the virtue from the soil, although the grass thus grown is not at first as good as that from a well-kept meadow that the plow has not desecrated for many years.

The cost of raising an acre of tobacco, it is estimated, is as follows:

Plowing and harrowing	$6 00
Manure	100 00
Plants and setting	15 00
Cultivating	10 00
Topping, worming, and suckering	10 00
Cutting and hanging	20 00
Stripping and packing	20 00
Total	$181 00

I make no account of the use of the land, which is more than paid for by its increased fertility.

A ton of cured leaf is not an extraordinary crop, but 1,500 pounds may be a full average. Prices vary with the state of the market, the best wrappers sometimes selling as high as 50 cents a pound, and at others for not more than 25 cents, while seconds are much less, and fillers but nominal in price. The average of all the crops for the past ten years would not be more than 28 cents per pound. This gives for 1,500 pounds $420, which leaves, after deducting the cost of producing as before given, $237 for the net profit of an acre.

But it is still questioned by some if tobacco raising is not enriching the farmer of to-day at the expense of those who come after him; if in a succession of years more value cannot be obtained by ignoring tobacco and raising other crops; or in other words, if more life-sustaining products cannot be raised by increasing as much as possible with the manure made, the fertility of the whole farm, and using its results in still further enriching the soil. We have, as stated above, a profit of $237 from an acre of tobacco, beside leaving the acre richer than before. If with this money fertilizers are bought and applied to the rest of the farm, will it be richer than if the labor and manure expended on the tobacco had been given to e grass and other crops? The farmers here think yes, and thei experience of many years seems to prove it. Are they mistaken?

From the sowing of the seed bed till the crop is sold and the money pocketed there is continual risk and anxiety. Drought may interfere with the setting of the plants or with their immediate growth; the cut-worm may render it necessary to re-set many after the rest are well started, which, if they grow, render the field spotted and unequal in time of ripening; tobacco worms and sometimes grasshoppers may eat holes in the leaves, rendering the best only fit for seconds; a heavy wind may break many leaves; a hail storm may in 15 minutes entirely ruin the whole crop; a protracted rain may drown it, as the roots cannot be submerged more than 12 hours without utter ruin. When safely housed it may not cure well—it may rot on the poles, and when finally packed it may not sweat out good. But here, as in all other business, there seems to be a definite relation between risks and profits, and he who chooses to ride on the fast train of travel or money making, must take the chances of a smash-up.

Farm Economy.

WESTERN FARMING.

IT occurs to me that a few thoughts concerning farming in the West may serve a good turn to many readers of the RURAL who are coming from the East—at least I am positive that my accumulated experience would have benefited me materially could I have had it earlier.

A large proportion of those who come to open up farms are men who have had little or no experience in farming previously, and they generally succeed the best, for they have no theories—adapted only to some other latitude that must be thrown overboard.

The great mistake is to suppose that the road to success can best be traversed with a plow. If one desires to make grain raising the business of his life, he can scarcely do worse than come here. We cannot compete with some other States in producing wheat, or even corn, and yet very fair mixed crops are raised. It does not pay to raise grain to ship. Wheat should be raised simply for home consumption. Corn should only be sent to market changed into hogs, cattle and wool. Where the deer and antelope love to dwell, sheep are raised with little care. Where vast herds of bisons have fled, our native cattle thrive.

The greatest curse to the Nebraska farmer today is a superabundance of first-class farm machinery purchased "on time." If the capital locked up in headers, harvesters, grain drills, etc., were in sheep, we could soon laugh at the locusts. It will pay to ship wool, it will pay doubly well not to ship it, but manufacture goods at home. Streams of water are waiting to set a million spindles humming, and the operatives will help to consume our surplus grains.

It is a fact that I cannot account for that cattle, other than Texas, command a price almost equal to that price in Michigan, while the cost of production is comparatively nothing. Look at this? A good quality of hay can be had for the cutting. During the six months that crops are in the way, viz., from May to October inclusive, stock is herded for one dollar per head, the owner being relieved of all care of them, even to the giving of salt.

Harlan Co., Neb.

POTATO BEETLES.

WE have been troubled with potato beetles in our section for six years, and have learned to so manage that we get plenty of potatoes in spite of them. Hand-picking is of no account when the beetles are plentiful, though we tried it at first. We find the best method is to take Paris green in the proportion of a teaspoonful to a gallon of water, and let the most careful hand on the premises have the job of sprinkling the vines with a watering-pot. In the middle of the day, after the dew is gone, the beetles are most hungry. If it is showery, so that the poison will be likely to be washed off directly, we wait for a more fitting time. For late potatoes, like peach blows, it is sometimes necessary to go over the vines three times—the early ones not as often. Wait until the young larvæ are hatched out, and go to work, before applying the poison. For a large field it saves time and labor to draw a barrel of water out on a stone boat.

FARMER'S WIFE.

WIND MILLS ON FARMS.

EDS. RURAL: I notice that you speak very highly of wind mills. As a working farmer I, too, think that a wind mill is a very profitable thing for a farmer to own and very convenient—at least it has proved so to me. I have worn out one mill of the old-fashioned kind, and a year ago bought an Althouse & Raymond mill, made by the Curtis Manufacturing Co. of Albion, N. Y. This mill pumps all the water needed for my live stock and to irrigate an acre of land used as a garden, and furnishes enough, besides, for a fountain in my front yard. In addition to this, I cut feed for my cattle in winter. It has a 12-foot wheel, and cost me about $126, and in one year I think the mill has paid for itself ten times over.

I am going to get a larger mill, one that is geared, to use to grind feed. I think it will pay. I am not interested in the sale of this mill or any other, and I presume that there are many others as good as this one, but I give my experience, and if it is worth anything to brother farmers, I shall be glad of it.

I find it very profitable to cut my fodder in the winter. My stock seem to do better; eat what is given them without wasting. I would like to ask if a milk and cheese house should be shaded. I have one, and, for some reason, milk does not keep good in it. It stands where the sun shines on it all day. Would it be a benefit to set trees around it?

JAMES KNAPP.

Rochester, N. Y.

[IT will certainly benefit the milk room to give it shade. Plant the trees this fall, and use those of good size.—ED. RURAL.]

The Poultry Yard.

KEEPING POULTRY.—No. 3.

AFTER a novice has decided what breed he will keep, the next thing to be taken into consideration is, of whom or where they can be obtained. On this point I will offer some advice that will, if followed, save the beginner time and many a failure.

Do not buy a trio or more of fowls that are of one brood, or even related, as most fowls are in one yard. Many persons start in this way and go through one year of mortification at not raising but few if any chicks. Having paid a high price for first-class birds, and perhaps built a new house for them, it is but natural that the purchaser should consider himself entitled to some return, and if it does not come, he is inclined to blame the one from whom he purchased his stock. All his dreams of fine broods of chicks running about to delight his eye vanish, and this dampening process often causes the novice to throw up breeding of fowls with disgust, except he is one of those persistent fellows who will pocket his losses and begin again.

Why not begin aright and save yourself trouble? First, find responsible dealers in breeds that you desire and procure the hens or pullets of one, and the cocks or cockerels of another, and even then it is well to ascertain whether the fowls of both parties are related. If they are only remotely related, there is not much to risk. But look out to get all clean-feathered, lively birds. See that the cock is full of life and vigor. To run with pullets, a cock is best; if with hens, a fine young cockerel is considered best.

This is the best time of the whole year to buy stock cheap; many breeders have now ceased breeding for the season and desire to dispose of their old stock to make room for the new and, as he hopes, improved young ones. An. Another breeder is, perhaps, for want of more room, overrun with young cockerels, and will often sell them for half the price he would in October, or later, and yet pick out good birds. Most breeds will now show what degree of perfection they will most likely attain, except the Asiatics, in which size is the great desideratum. If the purchaser intend starting for prize birds, he must have weight in Asiatics; if he have not prizes in view, then he can buy half-grown stock at a very moderate sum and from excellent strains; care will bring the rest.

Many an old breeder will fall into this mistake of breeding a trio of relations, finding it difficult to obtain fresh blood of as good points, taking the chances with them; the results are so inferior that they determine to do so no more, but continue for the reasons named. Some writers go so far as to advocate inbreeding, but it must be under peculiar circumstances, which do not usually present themselves, that success can be obtained by such a course; but the inexperienced had better not try inbreeding, for if they do, it will cost them many a disastrous and perplexing failure.

H. HALES.

CURE FOR CHICKEN CHOLERA.—We are indebted to a subscriber's wife, says the Gadsden Times, for the following cure for this disease: Mrs. Moore says:—"Last year I lost upward of 100 chickens. I tried every remedy I could hear of without success. This year I gave my chickens a feed or two every week of onion tops, boiled and mixed with meal, and kept a little sack of tar in the trough, and found it successful—have not lost a chicken. My neighbors and the tenants on our place have lost nearly all they had by this disease.

Dairy Husbandry.

A CHEESE FACTORY IN CONNECTION WITH THE MILK TRADE.

The proper manner of managing the city milk trade has been a question that has long agitated the milk farmers, as well as those engaged in the sale of milk after it leaves the farmer's hands. According to the general testimony of those who produce milk, great abuses have been practiced from time to time upon the milk farmers by the milk contractors, or those who take the milk from first hands and who virtually control the city milk trade. It is claimed that these contractors unite together to control prices; that they do indeed fix the rates at which the farmer shall sell his milk, and often the price is made so low as to leave producers but a slender margin above the actual cost of production. Now, the question may occur here as to whether the same privilege of combination does not obtain among farmers as with contractors, and hence the farmers, having the product in their own hands, have not altogether the advantage in fixing the rates on their milk. Many, at first thought, would be more ready to charge the farmers with combinations than the contractors. But however plausible in theory this may seem, it does not prove to work well in practice. The milk producers are many, and they do not readily form combinations or hold together. Individual interests and peculiar circumstances surrounding the former and his calling are powerful levers to break up the best-arranged combinations, while, on the other hand, the contractors are few; they have one interest; they have control of the milk routes; they are familiar with the trade; they are directly on the ground of operations and are too strong for the farmer, who, with the multiplicity of his avocations at home, his need of ready money, and his fear of losses on a most perishable product, all make him yield to the situation. Of course he grumbles lustily, but, seeing no safe way out of the trouble, is obliged to submit. But the fixing of prices is not the whole of his troubles. When there is an oversupply of milk in the market, the contractors begin to complain of bad milk, the surplus being often returned or dumped in the city sewers and the loss charged against the producer. There are other petty annoyances to which the milk farmer is subjected, and from which relief is sought. Indeed, the burden of all these troubles has become so onerous of late years that the milk farmers have held conventions from time to time and various plans have been suggested to obviate the grievances complained of; but little good has come from them.

Recently we had an interview with Mr. A. R. Gove, of the firm of Paige & Gove of Boston, who are wholesale dealers in milk in that city. Mr. Gove gives us the general plan on which his firm conducts operations, and by which it is claimed the milk trade can be operated with more satisfaction to farmers, and in fact to all parties interested. The firm contracts for milk direct from the producers and sells to the milkmen, who supply customers. The milk comes largely from New Hampshire and is put up in 8½-quart cans, which are packed in ice on the cars and are received at the depot in East Cambridge, near which the firm have a cheese factory for working up all surplus milk. The milk, being packed in ice, arrives in good order, and is sold on the arrival of the cars to the milkmen, who run their various milk walks and supply their regular customers. All surplus milk, or that which cannot be sold, goes to the factory and is there converted into cheese. This, it will be seen, avoids loss, since, if the milk was returned to the producer, it could only be used as a feed for hogs, and would not much more than pay for the trouble of handling.

Paige & Gove receive daily about 600 cans of milk, or somewhere near 1,200 gallons. Their contract with the farmers is for six months, as follows:—In April, 29 cents per can of 8½ quarts is paid; during May, 27 cents; in July, 26 cents; in August, 30 cents; in September, 31 cents. The contract also makes allowance for surplus milk, or for that worked up at the factory, since in turning the milk into cheese it nets considerably less than when sold direct for consumption. The firm gets on all milk sold about 10 cents per can more than the price paid to producers, which is not considered more than a fair remuneration for rents and other expenses connected with the business, together with the risks of bad debts, the contractors of course selling the milk on their own account.

We are told that this plan gives general satisfaction, and indeed it seems to be a great improvement over the old way, as it relieves the milk farmer from many of the annoyances connected with the business when thus conducted. Of course the fixing of rates is the most serious point to be adjusted, and when the contractors are disposed to pay the farmer fair, living prices for his milk, there can be no further differences to be settled.

The prices agreed upon under the contracts of Paige & Gove, it will be seen, are not far from 3½ cents per quart. This, perhaps, by most milk producers would be considered low, still it is fully one cent per quart more than the cheese dairyman is realizing from his milk, and the decline in prices must be taken into account.

Some such plan as that described could be advantageously introduced, it would seem, for conducting the milk trade in other cities than Boston. Possibly an improvement on this plan would be for the milk farmers of a district to form an association and erect a factory on their own account and thus trade directly with the milk peddlers through an agent or salesman appointed by and under the control of the association. They could then dictate a higher rate for their milk. But this plan also would have its drawbacks, since it would involve a more complicated machinery in the business, while the liability of mismanagement by the agent and the loss from selling to irresponsible parties must be considered. In fine, as the whole business would not be likely to be managed so closely and profitably by an agent as by men who were directly interested in the sale of milk on their own account, the net profits might be no better than on the Paige & Gove plan.

There is no trade that demands a more thorough reformation than the city milk trade. Consumers have rights as well as farmers; they should have a good article at fair rates, and whether the trade be managed on the plan of Paige & Gove or through an association, as suggested, it is the duty of those having control to see that the rights of consumers be protected. We are opposed to all exorbitant and excessive prices for farm products. The farmer and the merchant should be fairly remunerated, but all combinations to extort unreasonable values from the consumer should be discouraged and broken up.

We should be glad to hear from our friends in New England concerning the Paige & Gove plan of conducting the milk trade, and will our esteemed friend Wetherel of the Boston Cultivator, who has been guarding the Boston milk trade, tell us how the plan named is working?

HOT WEATHER MILK AND FLOATING CURDS.

The intensely hot weather of the past few days is causing trouble at the cheese factories, and floating curds are not unfrequent even in the best regulated establishments. We enjoin upon dairymen the necessity of more than ordinary care during this hot weather in cleansing dairy utensils, and in every department of the dairy extreme neatness should be observed. Let no foreign matter fall in the milk while milking. Let the pails and cans be thoroughly washed after use with *boiling* water, and see to it that there are no accumulations of dried milk in the corners or crevices of these utensils, because these particles of filth are active ferments which develop with wonderful rapidity under the high temperature of the weather we are now having. But especially let dairymen have a care in driving cows leisurely to the stable at milking time. A great share of the floating curds now making their appearance may be traced to the rapid driving of some herd or herds, thereby overheating the cows and rendering the milk feverish and bad. The milk of four or five cows which have been raced in the pasture by dogs just previous to milking will set 600 gallons of milk in active ferment and will cause the curds to float during this intensely hot weather, even though precautions be taken in cooling down the milk at night.

At the Old Fairfield factory yesterday (Aug. 8) we saw Mr. Fairchilds' method of treating "floaters." No change in the process of manufacturing from that employed for cheese made of good milk, except in the development of acid, which is carried along considerably further than for ordinary cheese. Mr. F. says he wants the acid developed so far that the curds will "*spin*" from an inch and a quarter to an inch and a half under the hot iron test. Then let the curds lie exposed longer after salting, and after pressing for a time, remove the hoop and allow them to be exposed to the atmosphere a short time; then, on returning to the hoop and under press, an additional quantity of whey will be expelled, which otherwise would not come out until fermenting in the dry room.

Mr. F. has been quite successful in his treatment of floating curds this season, and he showed us several cheeses made from very bad milk. These cheeses had cured down nicely and were of very close texture, and though not equal in flavor to those made from perfect milk, yet with no strikingly marked peculiarity to arrest the attention of dealers or cause them to suspect that the curds had been "floaters." It is always well to know how to treat floating curds, but it is better to take the proper steps to have milk in good order, so as to avoid its making a floating curd. Floating curds, it may be remarked, are salted a little higher at the Fairfield factory than ordinary curds. Such cheeses may at a certain age pass in the market without serious objection, but they lack keeping qualities, and are sure, sooner or later, to show the *cloven foot*.

CUTTING CHEESE ON THE COUNTER.

Grocers that sell cheese by the pound object to those of large size on account of the waste in cutting on the counter. In the usual manner of cutting, each piece separated from the cheese has a sharp angle. A portion of this wedge is apt to break into crumbs, while the whole sharp angle is not in the right shape to make a nice appearance for the table. This defect has always been noticed by consumers, and especially by retailers, who cut and sell small quantities of cheese. Those accustomed to buy cheese at the counter in small quantities will have observed how difficult it is to carry home a thin wedge of cheese without breaking a portion into crumbs, thus rendering it unsightly for the table and entailing loss. In England this is a serious objection to large cheeses, and hence the demand for those of smaller size, which may be quartered and then subdivided in an opposite direction, which is the usual method of cutting cheese on the block in that country, to avoid crumbs and waste. A grocer of our acquaintance, who is an extensive dealer of cheese at the counter, suggests a method of cutting cheese to obviate the difficulty referred to. He has practiced it during the past two seasons with entire success, and its adoption may be of advantage to retail dealers generally. The plan consists in cutting into the cheese half way from circumference to center, and from this point turning the knife and cutting at right angles partly across the cheese, and then turning the knife again and cutting to the outer edge, taking out about an eighth of the cheese. Thus we get a block of cheese free from the objectionable angle and which may be subdivided into pieces as desired. The same course is to be observed in taking out other sections of the cheese, and when the whole outer portion has been removed there remains the center piece, which is in an octagon shape and can be cut into pieces as desired without loss. The suggestion appears to be a good one, and can without doubt be adopted with advantage to cutter and customer.

Sheep Husbandry.

SHEEP AND SHEEP HUSBANDRY.

Paper read at a meeting of the Vermont Board of Agriculture by A. R. Perkins of Pomfret, Vt.

The possession and keeping of any of the choice and valuable varieties of sheep will be of little avail unless it is accompanied with good sheep husbandry.

It is essential to good sheep husbandry for the owner or shepherd to believe that only by good care and attention to the sheep he can succeed well in the business or make it pay. The shepherd should be a person who is fond of sheep, and it should be his delight to care for them. He should believe that the time spent in caring for and the food given them is neither lost nor wasted.

Another essential point in good sheep husbandry is to keep the sheep in a thriving, healthy condition in all seasons of the year. If our sheep are losing flesh and running down, we can, during such time, get but little pay for keeping them. At such times the wool grows but little, and it is weak and unsound. To expect to raise a good quantity of good wool upon a sheep that is poor in flesh, is like trying to raise a good crop of grain upon poor soil.

Good sheep husbandry costs less than poor, and pays threefold more. Good sheep husbandry consists in a great measure in doing the right work at the right time. Thus, if we shear sheep, do it in season; do not let them wear their fleece a month after it has become burdensome to them. June is one of the best months in the year for sheep to thrive if they are shorn. It costs less to house a flock of sheep that are just shorn before a storm than it does to cart them to the barn when they are benumbed and chilled. It costs less to mend the fence before the sheep get in the habit of being unruly, as we call it. It costs less to cut and cure the hay in season and when the sun shines than it does to do it out of season and in rainy weather. If from any cause our hay is poor it costs less to feed some grain in season than it does to let them lose flesh and get poor and then spend our time in nursing and doctoring them. I think there is a proverb, which is, that good food is cheaper than doctors. Without pursuing this subject further, I repeat that good sheep husbandry costs less than poor, and pays threefold better.

A flock of sheep require but little care during the summer months except that they have plenty of good feed and salt, and are seen to that none of them are sick or diseased. The principal work to be done in this season is to raise a suitable quantity of roots, etc., and cut in the proper season, and cure well and store the necessary supply of hay and grain. Roots, apples and pumpkins are necessary to some extent for the sheep in winter, not only on account of the nourishment they contain, but to supply the lack of green feed and to keep the sheep in a healthy condition.

The cutting of the hay in proper season, and curing well and storing the same, is one of the essential points of good sheep husbandry. If from any cause we fail to do this our sheep, the next spring, are usually poor and weak, and we have bad luck in raising lambs, the sole cause of which is that the sheep during the winter have been eating poor hay, and vainly endeavoring to obtain from the same their necessary amount of nourishment, which the hay did not contain. Course and rank timothy makes fair sheep hay if it is cut a few days before it begins to blossom and is well cured.

Nearly all kinds of low lands and swamp hay is good sheep hay if cut in season and well cured. Sheep prefer a variety of good hay instead of being confined to one kind only.

Lambs should be weaned when they are four months old and turned into good feed. If they are fed daily, in addition to good grass and hay, one pint of oats and shorts apiece until they are turned out to grass the next spring, they will have a good start toward making a sheep with a good constitution. I belive it to be a fact that if we would raise sheep with good constitutions, we must supply them liberally during their growth with that kind of food that will furnish them with the necessary amount of bone, muscle and strength.

Sheep, and lambs in particular, should be housed during cold storms in the fall and be fed with hay, which they should learn to eat before they are entirely deprived of grass. All kinds of sheep, and breeding ewes in particular, should come to the barn in good condition in the fall. This is necessary in order that they may be able to well develop their lambs. All kinds of sheep should be allowed to run out upon the ground daily in the late fall and early winter as long as the ground is bare. This is necessary for their exercise, which promotes health, strength and vigor. A reasonable amount of exercise is necessary for sheep during the entire winter and spring. Sulphur and ashes should be fed to sheep with their salt during the winter. Sulphur is healthy for the sheep and is offensive to vermin.

The ashes are also healthy and are essential for breeding ewes. I presume that some of you have seen lambs that when they were first dropped were strong; their dams gave a good quantity of milk, yet in a few days the lambs would begin to droop and finally die. If you were to open the stomachs of such lambs, in some cases you would find them packed and distended with hard curds which were the cause of their death. The remedy for this is to feed the breeding ewes with some kind of a mild alkali like ashes for some time previous to their lambs being dropped.

Sheep should be turned out upon the ground daily as soon as there is a spot bare that is large enough for them to stand upon, for the air in their pens and stables is generally impure, and no amount of good feed will supply the lack of good air and exercise.

There are various diseases which sheep and lambs sometimes have, and troubles to encounter in breeding sheep. There are causes for all of these. It should be one of the studies of the sheep breeder to learn what those causes are and and avoid them; when we do that we shall have good luck in sheep husbandry.

Brother sheep breeders of Vermont, we have had of late a dark night of depression in our business. During this time Victor Wright, Edwin Hammond, Judge Colburn and Nathan Cushing have passed beyond this life. They were some of the pioneers and landmarks to us in sheep breeding. We remember their many acts of kindness with gratitude. Their loss we deeply deplore. Their flocks of sheep have to some extent been scattered—some of them have been sold and gone to distant lands, carrying with them a good reputation for Vermont sheep. Other flocks of sheep have during this time gone down because of neglect and and false theories of breeding. Other flocks of sheep have been scattered because their owners had not much depth or root within themselves, and when the hour of adversity and reproach came, they withered and gave up the business. There are many persons who have in the past and who will in the future stand by the business. Brothers, be not discouraged, for the night, although long and dark, is disappearing. Already unmistakable signs of returning prosperity greet us on every hand. Let us rally to our work, which is to show the world by our acts and deeds that the fine wool sheep breeding of Vermont is neither waxing cold nor disappearing, but that its course is onward in the march of improvement.

Scientific and Useful.

VEGETABLE LEATHER.

The English Mechanic says: Under the title of "Improvements in the Manufacture of Vegetable Leather," a patent has recently been obtained in Great Britain for an invention which promises to utilize certain waste or cheap products. Fucus of several species and Laminaria are well-known sea-weeds, as plentiful on the sea-coast as grass in the fields, and waste textile materials of vegetable origin are still in sufficient abundance to find profitable employment in the manufacture of this "leather."

Sheets of carded wadding are manufactured with cotton waste or cotton itself, according to the quality required to be produced, uniform in thickness, length, and width, which sheets are placed on polished zinc or other metal plates, then the wadding is coated with a concentrated decoction of "fucus crispus" or pearl moss, or other fucus or mucilaginous lichen (rock moss), or any other similar mucilaginous substance may be employed. The metal plates require to be kept hot, in order to allow the mucilaginous decoction to penetrate thoroughly into the filaments of the cotton. The sheet is then dried quickly, thus giving to the surface applied to the metal plate a glazed or polished appearance resembling the gloss of ordinary leather. The sheet thus prepared is passed between two heated cylinders or rollers perfectly polished, having a space between them the exact thickness required to be given to the sheet to be produced.

Great pressure is required in order to press and felt all the filaments of cotton thoroughly together, and thereby render the thickness of the sheet uniform. The sheet is then coated with boiled linseed oil, and dried in the open air, or by means of artificial heat. When the sheet is dry a coating of thin vegetable wax is applied, according to the use to which it is to be adapted, and the sheet is softened by passing it through heated fluted rollers, by which means it is softened in a uniform manner; it is then passed through other polished rollers, according to the quality of the leather required, either plain, morocco, embossed, glazed, or otherwise, and it is then bronzed, silvered, gilded, or varnished, and finished in like manner to ordinary leather. French, vegetable, or similar leather thus prepared is waterproof, and easily stamped. Elasticity is given to vegetable leather thus produced by placing the sheets impregnated with the decoction of fucus or other mucilaginous substance between two plates perfectly adjusted, having the design embossed or in intaglio. Great pressure is then applied to the plates, and the dried sheet is then passed through rollers, which, by flattening the embossed parts, form a smooth surface, which is then treated as above stated, and becomes elastic after the oil is dry. Pressure may be also successfully applied before the leather is impregnated with siccative oil. The materials can be made white in the manner previously described, by selecting very white fucus, and by bleaching the oil to be used, and various colors from the lightest to the darkest may be obtained. If the leather thus produced is required to be inodorous it is only necessary to wash the oil in a weak solution of chloride of lime.

A method of preparing vegetable leather of this character for use as cheap sole leather consists in thickening the decoction of fucus or mucilaginous lichen with cotton waste or dust until it becomes a thick paste. The paste is then run into molds or blocks, and is pressed by means of an hydraulic press, in order to form solid blocks of any suitable thickness, which are then dried and cut by saws or otherwise into plates or sheets of the ordinary thickness of sole leather. Those plates or sheets are then soaked in boiled linseed oil, and when dry are pressed again between polished metal plates.

Besides the use of cotton waste and dust, all kinds of textile materials and their waste, especially cocoanut fiber waste and dust, may be employed in the manufacture of vegetable leather suitable for carpets or floorcloth of novel and superior quality. This new or improved "French vegetable leather" can be used in place of natural leather, and may be employed for covering tables, chairs, sofas, traveling-bags, for the lining or bodies of hats, caskets, carriages, harness, military equipments, slippers, bookbinding and various other purposes.

SOMETHING ON VENTILATION.

In Rural of July 1st, I notice the two following sentences:—"Carbonic acid gas is heavier than atmospheric air. In ventilating our sleeping rooms or other apartments, the ventilators should therefore be at the bottom."

It is now a well-established law, that gases diffuse equally through each other in any given space, though of different densities. It is therefore not in harmony with science to say that, because carbonic acid gas is heavier than air, the ventilators should be at the bottom. If there be any real advantages in having them at the bottom, I believe it to be due to the modifying influences which currents have on the equal diffusion of the gases, they being unfavorable to it. Some importance attaches, therefore, to the position of the ventilator in order to secure the most healthy exchange of air.

In a climate like ours, the science of ventilation is of necessity, associated with the subject of artificial heat. The old idea of admitting the pure near the bottom and having its place of exit on a high level has been abandoned. In this case, the air entering at the bottom would tend in the first instance to ascend on account of its rarefaction (*i. e.*, if, as we are presuming, the source of heat be a hot air tube), and thus establish a slight current in the upward direction. The air approaching the top would evidently not have been equally diffused throughout the apartment, and finding an aperture at the top, would at once escape. The atmosphere of the lower portion of the room, would as a matter of course, be colder and more or less stagnant.

The reverse of the above method is now universally recognized as being the most practicable, *i. e.* with the ventilators at the bottom and the place of exit for the air being on a lower level than the place of entrance. Here again, allow me to say the reasons for having them here, are not to be explained on the grounds intimated in your paragraph which I have quoted above. But in point of explanation I would adduce the following:—The air entering the apartment would tend, as in the former case, in an upward direction, but there being no outlet at the top, the current entering is almost immediately broken: it now obeys the law of diffusion of gases, warming and purifying the atmosphere of the apartment. At the same time the air most charged with carbonic acid gas and other products of inspiration, is escaping at the bottom, so that, owing to the drafts or currents of the ventilator, the most vitiated air was to be found at the lowest point of the room; the purest next above, (due to the entering draught) reaching perhaps to the hight of about 3 feet above the level of the floor, while the more equally diffused, and on the whole, healthiest air of the apartment, would be contained in the area above this point.

Where recourse must be had to the windows, it is desirable to secure a sufficiently rapid exchange of air with as little draft as possible. The best method of securing this, is by opening as many of the window sashes as practicable in a room, but only relatively as much as it would require one to be raised or lowered.

If the weather is cold, or one is sensitive to a draft, a very satisfactory plan is to take a board, equal in length to the width of the sash and an inch or more in thickness, placing it immediately below the lower sash, to prevent it lowering. This brings the upper edge of the lower sash above the lower edge of the upper sash, thus leaving an aperture through which air rushes into the room, not directly, however, but necessarily in an upward direction. No draft is felt by this method, and yet an abundance of fresh air can be thus introduced.

Sleeping rooms can be very satisfactorily ventilated by the last mentioned mode, by thus avoiding the pernicious results of drafts. Sleeping chambers should, as a rule, also have a transom over the door with a revolving window. Door-sills are unfavorable to proper ventilation, and should therefore be abandoned. Fearing I have already tresspassed on forbidden ground, *I'll drop.* J. M. A.

[It is true that when gases of different densities are mixed that they do not tend to separate, forming different layers—but the "velocity of diffusion" is very different, the law being that it is inversely proportional to the square roots of the specific gravities of the gases, (see Draper's Kane, p. 267). The specific gravity of carbonic acid is 1,521, and hence when disengaged, accumulates in all cavities within its reach and may cause fatal accidents to animals who enter unadvisedly. In volcanic countries (idem p. 486), caverns are frequently occupied to the level of their surface by this gas, exhaled from the ground; and an experiment often tried, to amuse the traveler, consists in walking into such a cavern with a dog, which, holding the head near the floor, is almost instantly asphixiated by the layer of carbonic acid, while the men, whose heads are above its level, breathe pure air; the dog, on being thrown immediately into a neighboring pond recovers from his stupor.

The high specific gravity of this gas and its slowness of diffusion, are well shown by the familiar experiment of placing a lighted taper at the bottom of a jar containing air, and taking in the hand another jar containing carbonic acid. On inclining this jar, the heavy gas pours over the edge, nearly as water would do, into that in which the taper is placed and, falling to the bottom, extinguishes it.

When we consider that a healthy man spoils in twenty-four hours, by respiration, 720 cubic feet of atmospheric air, that is, a mass of air eleven feet square and six feet thick (idem p. 268) and that respiration goes on within a foot or so of the floor, our correspondent may conclude that bottom ventilation *is* quite "in harmony with science" for the very reason that carbonic acid is heavier than air.—Eds.]

The Swine-Herd.

PROF. LAW ON HOG CHOLERA.

Prof. Law of Cornell University, in commenting on one of the many "sure cures" for hog cholera, says:

When tried in a sufficient number of cases, and extending over a series of years, all these boasted specifics have hitherto broken down. Examples, which might be very greatly extended, imply that a sound mixed diet is of great importance in maintaining a healthy activity of the various organic functions and a vigor to a large extent antagonistic to this and other diseases, and that a somewhat similar immunity may be secured by the use of tonics, antiseptics and gently stimulating agents. But if we rest our faith upon any or all of these as sure cures or preventives, we shall only pave the way for disappointment whenever the disease takes on an unusually malignant type. Thus, in spite of the protective power of a partially milk diet, as above mentioned, how often does the disease prevail most disastrously in the herds of cheese and butter factories, and, notwithstanding the good effects of an occasional meal of flesh, we find the most extensive losses among pigs that are largely carnivorous (flesh-eating) in their habits.

Keep your hogs clean is good advice. Protect them from the hot, reeking bed of manure and close sleeping place, where the emanations from decomposing dung, urine, straw and other organic matter are added to those of their own skins and lungs when huddled together in great numbers. See that both food and water are clean—that is, free from disease germs and from the microscopic particles of decomposing organic matter, which, within the system as well as outside of it, furnish appropriate food for the disease, poison, and favor its increase, while they depress the vital powers and lessen the chances of the virus being thrown off. No less important is the purity of the air, since the delicate membrane of the lungs, perhaps more than any other, furnishes an easy mode of entrance for any injurious external matter. Finally, purity of the blood can only be maintained by a healthy functional activity of all the vital organs, which insures the perfect elaboration of every plastic constituent of the blood and the excretion of all waste matters that have already served their purpose in the system.

By perfect cleanliness the poison, even if generated or introduced, will be virtually starved out as surely as an army in a closely-besieged fortress. But it will be observed that this implies the separation of sound from diseased animals and the free use of disinfectants (solutions of sulphate of iron and chloride of lime, fumes of burning sulphur, etc.) to purify the air and other surrounding objects, as well as the simple clearing away of filth. And it is here that pork raisers are most frequently at fault. Fifty or a hundred pigs are allowed to crowd together in a filthy manure heap, a rotten straw stack, or under a barn subjected to the droppings of other animals, as well as their own products. Their feeding troughs and drinking water are so supplied that they can get into them with their filthy feet, and they must devour the most obnoxious matter or starve. If under this abuse disease is developed, the healthy are left with the sick, as "they will all have it any way," and the result is usually a clean sweep.

When hog cholera exists, the sick should be placed by themselves under a special attendant and under the free use of disinfectants; the healthy should be carefully watched, and on the first sign of illness, as increased temperature, to be ascertained by the introduction of a clinical thermometer into the rectum, they should be at once taken from the herd and carefully secluded. This, with active disinfection, will enable the owner to cut short an outbreak and save, perhaps, the great majority of an already infected herd.

EPIDEMIC IN SWINE.

Time and again we have urged that the National Legislature should assist in suppressing noxious insects, which were likely to overrun the whole country, or an extended region thereof; but we are compelled to admit that few of our contemporaries joined us in urging the importance of such a measure.

The millions of dollars annually lost by the depredations of potato beetles, cotton worms, cabbage worms and bugs, and many other similar destructive insects, could, in part at least, be saved by the dissemination of a knowledge of their habits and the enforcement of laws for their suppression. Now, what is true of insect enemies is also true of epidemic diseases, which, in the main, are caused by parasites belonging to the animal or vegetable kingdom, hence we heartily agree with the National Live Stock Journal in what it says in regard to the duty of the Government in such cases.

We cannot urge too strongly the importance of scientific investigation into the nature of the various obscure diseases in swine, which have for several years past created such havoc in the pens of Western breeders and feeders. The loss which has been from this cause entailed upon the West, is almost incredible. A prominent banker in one of the richest counties of Iowa recently informed us that he had sufficient data to satisfy him that more than one-third of the hog crop of his county, last year, was lost by the ravages of hog cholera, and he placed the cash value of the property thus lost at not less than $100,000. When it is remembered that this is an estimate made by a prudent, careful man, accustomed to weighing facts and figures carefully, and who was never known to let his imagination get the better of his judgment, and that his estimate is for a single county alone, some idea of the extent of the damages inflicted by this disease—if it be a single disease—may be formed.

It appears to us that the duty of the general government, of our State agricultural societies, and of agricultural colleges in the premises, is imperative. If our Agricultural Bureau at Washington would undertake the work of making a thorough scientific investigation into the nature and causes of these various obscure and epidemic diseases in swine, instead of wasting the appropriations lavished upon it in distribution of the commonest sort of common seeds to the seediest sort of seedy Congressmen, and who have no higher interests to subserve than the securing of their own re-election by these cheap favors, some substantial good might result.

Scientific inquiry, extensively applied, and perseveringly followed, in various parts of the country, may reasonably be expected to result in wresting from nature the secret causes of this terrible scourge: and these once discovered, the remedy will be forthcoming. It is a crying shame upon our boasted enterprise and intelligence that not one dollar has been expended by our general or State governments, nor by our State Agricultural Societies or colleges, in the investigation of this subject. Ream upon ream of paper has been wasted in publishing accounts of the ravages of this disease; but the efforts thus far put forth to ascertain its nature, or arrest its progress, have been about upon a par with the injunction of the ancient Roman who called upon the people to "run to your houses, fall upon your knees, pray to the gods to intermit the plague!"

We have had full enough of this, and insist that it is time our National Bureau of Agriculture should do something to redeem itself from the contempt in which it is held by all intelligent agriculturists. Let a commission of men distinguished for their scientific and practical knowledge, be appointed to investigate this subject thoroughly. Let them go into the regions of the country where these diseases are prevailing, and subject all the conditions of climate, food, water, soil, confinement, breeding, etc., to the most rigid investigation.

Arboricultural.

CAMPHOR TREE.

Dr. Paul Maisonneuve has published an exhaustive history of Dryobalaneps aromatica, the Camphor Tree of Borneo. It embodies a brief summary of what has been written by various authors relating to this tree and its products, and the result of Dr. Maisonneuve's researches to ascertain where and how the camphor is formed. There are two products, the oil of camphor and the solid or crystallized camphor. The former is found in quite young trees, but the latter only in trees of a considerable age, and only in the central part or pith. The main facts observed in all the series of examinations of different parts of the plants, says the Gardeners' Chronicle, are these:—1. All the young parts abound in a reddish juice, which disappears almost completely by the time these parts are three years old; and, 2, numerous cavities are found in all parts of the plant. These cavities increase in number, and afterwards in size, by fusion, eventually becoming a vast system of channels, forming a communication between the most distant parts of the tree and the center of its trunk. The medullary rays, too, always contain a colored juice. From these facts Dr. Maisonneuve thinks we may draw two legitimate conclusions. First, that the oil of camphor is formed, and remains as such in all the young parts; and, second, that arrived at the center of the stem it absorbs two extra equivalents of water, and is then, partially at least, deposited in crystals, forming the true Borneau camphor, the chemical composition of which is, according to Pelouze, C 20, H 18, O 2.

Floricultural.

THE DROUGHT—ITS LESSONS.*

The degree of hardiness of any plant can only correctly be ascertained when it is in full health and when it grows in a soil and situation to which its nature is suited. Insufficient knowledge of these is the cause of the conflicting statements which are published respecting the same plant in isothermal sections.

The efforts of drought are frequently mistaken for those of cold. Deprived of moisture, it is deprived of food and thus half starved, though lingering through the summer, it succumbs to the severity of winter. Excessive richness as well as excessive poverty of soil may cause the death of plants during winter by inducing a superabundant, exhaustive growth, which they can neither mature nor support.

But we have trees and shrubs, herbaceous plants and annuals that are adapted to every variety of soil and condition of weather, and it is a knowledge of such adaptation that enables some—let the season be what it may—to preserve their gardens in comparative beauty.

The present summer, the hottest and dryest we have ever experienced, has wrought great mischief in those grounds wherein such relations have been entirely ignored, and only those who presume to believe that a liberal and prompt expenditure of money can be made fully as effectual in the reparation of damages as horticultural observation and study, will fail to be instructed by its stinging lessons.

It is true the present season has been exceptional and severe droughts local—but it is just these exceptional seasons that we should provide against in the selection and distribution of our so-called hardy plants. Let extremes of heat or cold, wet or drought occur but once in ten years—it suffices to kill or sadly disfigure the beautiful forms of many trees and shrubs that under our care have grown from babyhood to full maturity, and that constitute, it may be, those very objects of our grounds to which we have become most attached. In many affairs of life we may be guided by rules—in this phase of horticulture we should be guided by exceptions.

While now we see plants green and vigorous, growing in sandy soils or high, dry situations, whether in private grounds, in woods or fields, we may safely conclude that the same varieties are as well adapted to the highest, dryest parts of our own grounds and that, after cultivating them for years, they will not in their mature beauty be destroyed by drought, either directly or by being so weakened as not to be able to endure the cold of the ensuing winter. So, likewise, when we see plants suffering in such situations, we may be sure that they are not adapted to each other in any other locality. This is but one of the lessons of the drought; but it is well worth the learning, and requires but little inconvenience or effort.

To apply these remarks to floriculture, we have found that many plants that it has been deemed necessary to water daily during the dry, hot weather of other summers, have fared just as well during the present drought without being watered at all. We may point out especially *Plumbago capensis*, that though placed in the upper tier of a rockwork, exposed to the sun nearly all day and never watered, has bloomed more profusely than ever before, while the foliage is perfectly green and healthy. Had we watered this plant as in previous seasons, the impression could not be avoided that its preservation was due to the water and not to any special adaptation of the plant to the dryest of situations. Thus we are enabled to add one of the most charming of plants to the scanty list of those which are perfectly adapted to rockeries.

The *Eucalyptus globulus*, seeds of which were sown last December 3d, is now three feet high and of about the same breadth, with widely-spreading branches, and opposite, nearly sessile leaves that, in those two respects, recall the Honeysuckle. Though this has received no water, there is not one discolored leaf upon our several specimens, and the glaucous bloom that covers the young wood and leaves gives it a most refreshing appearance among the half-withered things about. We have already said, in a previous article, that the new shoots are furrowed and sharply four-angled. These furrows and angles gradually disappear until the ripened wood is as smooth and round as a ring. The bluish-green bloom of the new shoots is readily rubbed off with the hand, and should it be moistened with perspiration, they instantly present the appearance of being suffused in blood. No insect has disturbed our plants, and we should think that the *Eucalyptus globulus*, cut back from year to year, would become a favorite among tender sub-tropical plants, particularly where the plot is located in a dry situation.

As enduring droughts remarkably well, though worthy of general cultivation for other reasons, we call attention to *Plumbago Larpentæ*. This is an old, hardy, half-herbaceous shrub, to which, never having ourselves seen or cultivated it before this season, we have never before referred. It is as distinct from *P. capensis* as two plants of the same genus can well be. Its habit is compact—leaves small, spathulate, and flowers of a deep violet, in dense heads. The flowers are the size of the Verbena and like them, salver-shaped. There is but one thing that mars its beauty, viz., the flowers do not open simultaneously and they persist after their beauty has faded and form no very bright surrounding to those blooming after. Its hardiness (we know this from hearsay, merely,) compactness, endurance of drought, and possession of a color with which our gardens are never surfeited, are, however, characteristics that may commend its use to all—if not for the showiest of our borders, at least for those parts most liable to suffer from drought.

Among vines less commonly cultivated that thrive in dry places is the Mountain Fringe (*Adlumia cirrhosa*). The leaflets of this vine are peculiar, bearing no petiolular attachment and being every one of a different shape. Common in our Western woods, where it is found mostly in wet places, a dry position is the last to be thought of. It is a biennial, and its growth the first season bears no resemblance to a vine, but rather to a fern, having thrice-pinnate leaves and variously lobed little leaflets. Beside *Plumbago capensis* in the rockery, it flourishes finely.

All of us know of the Matrimony Vine (*Lycium vulgare or Barbarum*), and many readers will exclaim: "We know enough of it!" It should, indeed, be excluded from companionship with all other plants, on account of its spreading roots, which take possession of the ground and throw up suckers for an unwarrantable distance. But it is a gem in its place. Planted under the eaves of houses—at the base of old stumps and rocks—upon sandy banks, or in those out-of-the-way corners, which it is desirable to fill with verdure that will require little or no care—nothing is better. A single specimen of this shrub, for it is not a vine, grows in our own grounds close to a brick foundation, entirely exposed to the sun from morning till night, without having received one drop of water for three months or more. It is cut back every spring, so that with the bushy form thus forced—the drooping branches and its contrast of small and large leaves—so entirely is it the right plant in the right place, that from despising it as it was once grown among other things, we now prize the Matrimony Vine as all of us finally prize plants that fully respond to all that is asked of them.

A sickly plant, however rare or costly, is far from ornamental, and grounds which are planted without regard to adaptation of soil and situation, will fail to realize the expectations of the most tasteful arrangement.

Taste, alone, may correctly point out where trees and shrubs should be planted, either as single specimens or in groups; where the flower borders and beds should be located; where the lawn should be unbroken in its velvety green; where vistas should exist to lend the charm of mystery and picturesqueness to all. But a knowledge of the conditions under which plants alone can mature their fullness of beauty, is indispensable to the development and permanence of the design.

A part of this may be learned by an observance of the effects of droughts.

* The local drought confined to a circumference of about fifty miles in Bergen Co., N. J., is referred to.

NOTES.

The comparatively new Hydrangea *H. paniculata alba* is now beginning to bloom. The lower florets are opening, and it will be several weeks before all, to the uppermost, will have opened. Then the immense thyrses endure till hard frosts.

This shrub, as we become better acquainted with it, disappoints in no particular. It is unqualifiedly hardy, and is the Queen among flowering shrubs for the rest of the season if not for the whole season.

Cuttings from the half-ripened wood strike freely; but old wood, if we may judge by our failures, is worthless. We refer the reader to our full description of this Hydrangea in a late Rural, no statement of which need be corrected now.

Aquilegia cœrulea.—I would, with great confidence, introduce to the notice of lovers of really beautiful flowers the above charming and most desirable hardy plant. I have several patches of it, which I obtained from one packet of seed. They were sown in an open border the first week in April, 1875, and received ordinary attention during the following months; early in April of this year a plentiful supply of flower-spikes made their appearance, and since then no lack of flowers has been produced. I enclose some blooms for your inspection. I have submitted it to many ladies and gentlemen of refined taste, have used it for many purposes, and with satisfactory and pleasing results. It is more like some lovely Orchid than a hardy plant, and where not grown should be secured.

Thus writes a correspondent of the London Gardeners' Chronicle. The editors say that they share their correspondent's opinions. *We* say that we share the opinions which the editors of the G. C. share with their correspondent.

Our friends, Hoopes Bro. & Thomas claim to have introduced this plant into cultivation a few years since. They say it greatly improves with age in the size and numbers of its flowers. The color of the bloom is white and violet-blue. It is quite hardy. Those who cannot wait two years for it to bloom from seed, may purchase the roots.

Abutilon boule de niege reveals this season another good trait, viz., it does not require artificial watering, and blooms as incessantly in dry as in wet weather.

The Centennial.

CENTURY BLOSSOMS.

A. T. Goshorn, Director-General U. S. Centennial Commission.—Sir: The pomological exhibit of the week has been especially marked by a contribution of Early Apples from Dr. J. A. Warder, President of the Ohio State Horticultural Society. It embraced no less than 44 varieties, all in remarkably fine condition. Many of the varieties are not well known to orchardists, and this fact renders the exhibition a particularly instructive one. The Iowa State Agricultural Society made an exhibit of 30 kinds of Early Apples, chiefly from one grower. The size and beauty of these apples show how well the soil and climate of the State are adapted to the culture of this fruit. Some of the Red Astrachans measured 12 inches in circumference. The same Society exhibited a plate of Clapp's Favorite Pear, not quite ripe. Henry D. Welsh, Philadelphia, a plate of the Kohlenkamp Plum, a large oval variety, usually of superior qualities, but these were not quite ripe. Abraham Barker, Philadelphia, Dearborn's Seedling and Rostizer Pears. Joseph Shaw, Glen Rock, York Co., Pa., a seedling plum called Lincoln. It is about 2 inches long by 1¾ wide, of a light brown color, and of medium quality. S. C. Brown exhibits from the farm of David S. Brown fruit of the Harrison Pear. The fruit is no larger than a pigeon's egg and not worth propagating for its fruit, but it derives its interest from having been brought as a seedling in a flower-pot from England by Capt. Samuel, a relative of Harrison the regicide, in 1665. The tree is, therefore, over 200 years old, and is still in perfect health. Thomas J. Beans, Burlington, N. J., exhibits three varieties of peaches, handsome in appearance, but not quite ripe.

(Signed)
W. L. Schaffer,
A. W. Harrison,
Thos. Meehan,
of Board of Judges on Pomological Products.
Philadelphia, Aug. 12.

The following are the entries for the Bench Show:—9 Fox Hounds; 4 Harriers; 7 Beagles; 7 Dachshunds; 5 Greyhounds; 1 Bloodhound; 13 Imported English Setters; 128 Native English Setters; 18 Imported Irish Setters; 50 Native Irish Setters; 1 Imported Gordon Setter; 33 Native Gordon Setters; 12 Pointers, over fifty pounds; 38 Pointers, under fifty pounds; 2 Retrievers and Chesapeake Dogs; 1 Irish Water Spaniel; 2 Retrieving Spaniels; 13 Cockers; 1 Springer; 2 Mastiffs; 4 St. Bernards; 8 Newfoundlands; 5 Siberian or Ulm; 1 Dalmatian or Coach; 15 Sheep Dogs; 6 Bull Dogs; 10 Bull Terriers; 5 Fox Terriers; 8 Black and Tan Terriers; 10 Skye Terriers; 4 Scotch Terriers; 1 Broken haired; 3 Dandy Dinmonts; 5 Toys; 4 Pomeranian or Spitz; 2 Poodles; 22 Miscellaneous.

Gus. Smith of the Marysville (Cal.) Appeal has been spending some weeks at the Centennial. His baggage comprised a peck of lead pencils and some note books about the size of bank ledgers. By this time the Marysville people must have the whole Exhibition. If, however, he should have left any of it at Philadelphia, it would be well for visitors to hurry there, for fear he might come back and take the balance. Let us also in this connection express our commiseration for the readers of the Appeal, as we know how it is ourselves; too much Centennial is as bad as the itch.

Would it not be better for manufacturers of Agricultural Exhibiting Implements at the Centennial to wait until after the report of the committee of Jurors is made, before putting out circulars purporting to give the full test and opinions of said committee, as has been done by several of the Harvesting Machine and Seed Manufacturers? The report of the Jurors is strictly private, and has been sent in to the Centennial Committee for consideration.—Obed.

Among the articles exhibited by Canada is a lead pencil 7½ feet long, 2½ feet thick, and weighing 1,870 pounds. It is a long piece of plumbago, and was taken from a mine eighteen miles from Ottawa.

In the New York State exhibit is a large eagle made entirely of gold pens.

The Vineyard.

RAISIN MAKING IN CALIFORNIA.

The Yolo Mail gives the following in regard to the progress of raisin making in California:

We spent an hour at the home of Mr. R. B. Blowers of Woodland, Yolo County, and secured from him much information concerning the grape and raisin business. Mr. Blowers is not so extensive as he is thorough in his work. He has spent time, labor and means in it, and has been abundantly rewarded for his expenditure. He stands the equal, if not the superior, of any man in the United States in producing raisins. It has been decided that his raisins are superior to any in the Eastern market, or we might say in the world. He recognizes but one variety of grape—the Muscatel—as pre-eminently a raisin grape. Of this variety he has about 25 acres, and about two acres in other choice varieties to the number of 25.

There is method in all he undertakes, and he first studies the art of production. He prunes his vines tolerably early, and believes in systematic irrigation. Not content with the liberal supply of water which Nature gives during the winter, he taps the canal, fills the ground with water, and then again after the rains, or about the first of June. This water serves two purposes: It destroys the insects that infest the soil and adds at least one-third to the production, both in quantity and quality. This he did last winter, and the masses of bunches and innumerable clusters which weigh down the vines at the present time evince the wisdom of this work. His vines promise a yield at least one-third greater than ever before.

Last year he sold for table use $2,259 worth of fresh grapes—about 900 crates of which were sent East. He also furnished over 100,000 cuttings, mostly of the Muscatel variety, to parties in this and other States. Aside from this, he made 1,500 boxes of raisins, weighing 20 pounds to the box. These he readily disposed of to San Francisco merchants, who say that they are superior to any foreign raisins in the world. The estimate he places upon the present crop is that it will, after furnishing the usual amount for table use, make between 4,000 and 5,000 boxes of raisins. To meet the demands of the second crop he is about to build a drying-house. The rains come before the second crop is fully dried, and in this drying-house he will finish up the second crop. The first crop is sun-dried, which he claims as the best mode of drying.

Let no one who reads this suppose for a moment that all this is done without labor or expense. Mr. Blowers is an inveterate worker, and aside from his own labor he employs from the first of September to the middle of November 15 to 20 laborers, at a cost of from $1,200 to $1,500, which he pays in gold. He produces an article on which there is no discount, and demands pay in a currency not subject to discount. There is nothing "shoddy" in his business. He has a grape called the Emperor which he promises to ship in good condition to any part of the United States. It is a fine table grape, and delicious to the taste.

SCUPPERNONG WINE.

Several years ago we questioned some of the statements made by correspondents of the Southern press in regard to the value of the Scuppernong Grape for the manufacture of wine, and were pretty roundly scolded for so doing, but without being convinced that we were in error.

Mr. O. Taylor, writing from Florida to the Prairie Farmer, touches upon wine making at the South and from Scuppernong grapes as follows:

"I can't see how it is possible to get a cheap wine made out of Scuppernong grapes in Florida, as each grape has to be picked up one at a time and examined, and how that can be done at the present price of labor I cannot imagine. A cordial may be made by putting sugar in unripened grape juice, the grapes being shaken from the vines; but that cannot be called wine. Let any one try a wine cellar in the sand of Florida, and see how many bottles will survive one summer's heat. I will feel thankful when I know that there is as much fruit in the State as the children can eat. At present they go hungry for fruit."

If we are not mistaken, Mr. Taylor has had considerable experience as a horticulturist further north (Virginia), therefore he is fully competent to decide which of the two regions is better adapted to grape culture, as well as on the merits of the most noted sorts.

Another New Grape.—T. S. Hubbard, Fredonia, N. Y., sends us a bunch of a new and very early grape which has been named the "Fredonia." Mr. H. says that it is 15 to 20 days earlier than the Hartford and is about the same as the latter in quality. We think this variety promises well for a very early sort.

Landscape Gardening.

PICTURES ON GRASS.

This is the title of an essay read before the Ohio State Horticultural Society by FRANK J. SCOTT, author of that able work Suburban Home Grounds.

It has been many a day since we have read anything upon landscape gardening or kindred subjects with so lively an interest. Its chief object is to show the value of grass as an element of beauty in the home grounds—in the showing of which many pleasing and original ideas are happily expressed. Those who have traveled in the South during summer and have seen to what an extent the absence of green grass mars the picture, let it be ever so striking otherwise, will the better be enabled to appreciate Mr. SCOTT's views. We copy as much of it as our space will permit:

A picture, as we commonly use the word, is that disposition of objects which makes upon the mind a very pleasant or an unusually vivid impression.

The instinct to frame pictures in the mind is what makes all nature picturesque to some eyes; and for the lack of that gift, or the culture which awakens it, all the world's pictures are blanks to others. The art of seeing or discovering pictures that are near us all the time, often staring us in the face when we will not see them, is an art not lost but only rarely used. If you will take an empty picture frame and put it in front of your child's head, it will surprise you to see how handsome the child looks in it. What a fine picture! You are not in the habit of thinking of each child as a picture. Or, put the empty picture frame in the window, close the light around it, then stand back and look through, and you will sometimes be astonished to find how much of a picture this before unthought of bit of a window view makes.

The use of the study of drawing is mainly in this, that it teaches us to observe the pictures that abound on the earth and in the air all around us; for any bit of nature separated from the rest to concentrate attention upon it, and framed to still further convey the impression of individuality, is usually styled a picture.

When one stands on the border of a great desert looking to a far horizon through air that is all tremulous with the heat of a torrid sun, in the glare of that quivering light each object, as it stands outlined against the sky, is fairly burned into the memory. The vividness of its relief, its solitariness, and the golden light that bathes it, all combine to fix the scene indelibly on the mind. Whatever object the eye rests upon amid such surroundings looms up in the imagination with increased importance by reason of its isolation. There is nothing to distract attention. Whether it be a camel, a horse and rider, a bleached skeleton, or a far-off caravan, the whole world around seems subsidiary to it. Viewer and object are both on the summit-level of the globe; and, simple as the object may be, all the expanse of desert around is but the glowing monotone of a canvass to bring that object into high relief. That object is, therefore, fixed in the mind as a picture.

Whoever has seen our great western plains in a state of nature will remember the peculiarly vivid impression he receives of whatever objects break their vast monotony. On that vastest of deserts, the sea, when it is calm, objects that are mere specks on the wide expanse of water fix the attention of the observer with an instantaneous and engrossing interest.

It is the power of a simple plain surface to rest the eye, and to attract it to what rises out of that surface or borders it, which makes the simplest object a picture when seen on the desert or the ocean. I call attention to this fact as a key to the treatment of pictures of still life generally, and in the present instance to pictures on grass. If you will remember some stream or lake bordered by rocks or grassy slopes or over-hanging trees, how, on its glassy surface, in the tranquillity of summer, it mirrors every thing on its banks, and more than doubles the beauty of all its borders, and then remember the same water ruffled by winds and devoid of power to reflect a single beauty of its shores, you will have an apt illustration of the power of the plain surface to develop pictures.

Closely shaven or closely fed grass is beautiful in itself, like clear and placid water. It is more beautiful than a sheet of water in this, that it delights the eye by its color, and that it may rise and fall in undulations of light and shade without losing the smoothness of its surface. It is like the water-mirror, inasmuch as the objects which lie upon it or rise out of it are revealed with delightful distinctness, and their shadows fall upon it in the forms of the original objects, not mirrored, but suggested by grotesque variations.

It is, then, from the surface of a monotone, resting and agreeable to the eye, that most pictures are to be built up; and when done, the monotone base is essential to the effectiveness of the picture.

The most widely-diffused crop of the world is grass; the most useful of crops is grass; and shall I not be justified in claiming that it is also the most beautiful of all? I am of those who believe that the beautiful and the useful walk generally hand in hand, and in the natural order of things should be inseparable. Does the hunter seek game? In what covert does he find it but where trees grow and flowers bloom and—

"Green grow the rushes, O?"

Does the pioneer seek rich land? Will he not choose that where the oak is grandest, the hickory loftiest, and the undergrowth the most varied, or on prairie where the grass grows strongest, and the wealth of vigorous flowering plants betokens the varied nourishment below? Does he seek a mountain farm? Will he then not be drawn to some green spot on the hills that smiles under the morning or evening sun, and be sure, as he goes toward it, that where the sun decks the earth with that color she is there the sweetest, and warms quickest in the wooing? Does the burly grazier hunger for great profits on beef? He must then make a landscape lovely with the tramp of his herds. Rich must be the pastures, and fine trees must shade his cattle, and brooks must water them. With only beef and hides in his thought, beauty will environ him, and hide his rudeness in his own creations as the ivy does the rugged oak it lives upon; and the traveler will gaze as he passes on the beautiful fields, with their trees and herbs and brook, and see a landscape there. The painter will follow and put a choice bit of it on canvas, loving his work as never another may; or, perhaps touching so sweet a strain of nature that half a nation will see his work reproduced in wood-cut or in chromo, conveying into a thousand homes the pleasant emotions of the traveler and the painter as they were attracted to the grazier's fields by those pictures on grass.

Weeds will typify work undone; corn and hay are work being done; but the velvety grass is nature's smile of content with work achieved and happiness earned. It is mother earth's afternoon dress, in which all company is welcome. A few flowers for its trimming are better than a myriad in the wilds. Flora and Sylva are courtiers enough to know that they appear to best advantage on the velvet carpet which the grasses weave. A tree that would be unobserved in a grove, is lifted into majesty if it stands alone in the pasture field or the park; a common shrub, which, choked among other bushes, would be unnoticed, may be a vernal grace personified if allowed to spread with free abandon over such a carpet; and still both groves of trees and masses of shrubs are infinitely finer *en masse* also, if relieved by a spread of unbroken lawn of extent proportioned to their extent and size.

I have alluded to the fields of the farmer and the grazier as particularly adapted to pictures on grass. Every old farming country should inevitably grow to form an infinite variety of park pictures, broader and more varied than those of city parks, but it is not to these principally that I most love to call your attention. I would bring home to the owner of every *small* home having a rood of ground about it the capability for pictures on grass which such places afford. I never tire to think of those old lines of Milton—

"Hard by a cottage chimney smokes
From between two aged oaks."

That is a picture; the green sward is understood. For there are no cottages under aged oaks in velvety old England without a green sward setting. Paint the cottage, and the aged oaks on guard above it, but without the green sward they are as absurd as pictures of a ship under sail and no water under her. The sward in one case and the sea in the other are equally essential to the picture.

I have written it before, and it will bear repeating, that every man's home ground and house may be so arranged that they will be the part of a pleasing picture. We are doing better and better every year in this direction, yet how much is every where and continually lost in spattering the canvas with colors before we have any conception of the pictures we want, even in our mind's eye. How often trees or external views have made pictures ready for us to frame and they are unseen, and the improver sets heartily to work blotting them out or marring them with new paints called evergreens, shade trees, and florists' flowers, which in ignorant zeal are spread around as a donkey might paint with his tail. That style is not so much practiced as formerly, and there is a growing intelligence among us in a nebulous state which has a faith and a hope that a home may be made a picture every time, and that few are too poor to frame it with some sort of sylvan decoration. Just now there is great monotony in the forms and styles of home-ground pictures, and they are not often good enough to be chosen by artists for studies; still we are aiming in the right direction and make progress.

There is one fault common to many a fine home at the present time, where ample grounds and well-kept grass and fine trees *almost* make a picture, yet leave a sense of stiffness and priggishness on the mind that makes one doubt if all that carefully worked up show of house, grass, trees, and flowers is really beauty or not—really a picture, or only an unsatisfactory suggestion of a picture. Something must be wrong there, something wanting. What is it? I will venture the suggestion that in nine cases out of ten it is because the house rises naked out of the grass. There is no setting. Now, a home is a nest, the nest of one human family. It should nestle amid those things which have a disposition to nestle around it. Whoever saw an old wall or fence that the vines did not find and clamber over? that the blackberries and wild roses did not find a home in or near to? The foundation wall of a dwelling house is just another place for the best of these things. The house should rise out of a fringe of shrubs and vines which will bend over the grass on one side, and climb up the walls on the other. Only when in deep mourning will a tasteful woman leave her dress bare of all trimming at the neck. Half mourning permits a little fringe of linen or lace there. But our fine places are of more severe taste and exhibit the barrenness of deep mourning all the time.

I know that this absence of foliage against the house is defended on the plea that it is unhealthy to have much shade and foliage near the walls and the windows. Granted as to the shade, undoubtedly the deep shade. The complete embowering of houses under trees, as seen in the old style of New England homes, was unwholesome and gloomy. I would have none of it. But we need not keep our clothing at arms length from our bodies because some people have become delicate by wearing too much. It is easy enough to get all needful sun and air without any sacrifice of beauty. Shrubs may be planted on the flanks of steps, at corners of the house, and between the windows, where no light need be obscured or walls dampened by them. Small shrubs may go under the window-sills, and vines everywhere; while trees of heavy shade may be kept at a respectful distance. If the vines get in the way, how easy to lop off their superfluities.

A house that rises out of such a nestling as I have indicated will look at home in its place; the lawn will stretch away from this moss edge of shrubbery next to the house wall, and bring all the environment of shrubs and trees, young and old, into harmonious relations with the house, even if they be not picturesque enough in character to delight the eye as a picture. For the lack of this sort of setting many mansions of the larger class, with grounds in most respects fairly laid out, rise as cold and stiff amid their bright surroundings as a step-mother among another's brood of children.

But all this is about great scenes or great places. I imagine some one to say: But what have you to suggest to the great mass of people who have only small houses and narrow lots to improve, but who would like to have their home pictures on grass as well as their richer neighbors? It is precisely this branch of the subject which I would most gladly illustrate; but, unfortunately, words weary the hearer when used to describe the simplest form of mechanical work. Set about describing by words the commonest processes of work, the forming of a horse-shoe, for instance, or modeling in clay, or the more intricate processes of making carpets, and who would follow the words or learn from them? We must stand by the blacksmith, the modeler, the carpet maker, and follow their actual work step by step, and that, too, for months or years, before we can do their work.

We all want fine homes. We enjoy them ourselves, and we enjoy them ten times more when we know that others enjoy them. It is the blessedest wonder of the world that while we seem to be working with entire selfishness for ourselves alone, we are in fact working for everybody around us just as well. Your house, good friend, that you toil half a life time to build, every neighbor owns with his eyes. You want it to be just as handsome as your estate will allow, for you know they are all looking at it; and though you would deny them any property in it, you nevertheless feel so instinctively that they have, that you act on the idea, and try to satisfy them.

In truth, there are few things in life that we call our own which are worth owning if our neighbors are not part owners with us. Far more than one-half of all our expenditures are for the satisfaction or the delight of the eye alone; and not our own eyes only, but the eyes of all the community around us—our critics or admirers; for what is beauty, if not to be admired? or, as the poet has better expressed it,

"Small is the worth of beauty,
From the light retired."

To give pleasure to others is among the highest of human virtues, and I know of no higher satisfaction than to realize that so many who are not thinking of us at all, and do not even know us, yet do us a thousand favors for which we can be grateful. Even the successful cheat will some how blossom for us; for he may build a superb edifice whose architecture, to use the admirable simile of Madame de Stael, is "frozen music." We all feel the rhythm of its symmetry, and its lights and shadows, dividends or no dividends. Shall we not be grateful to the builder? Need we ask from what source of decay the rose draws its nourishment while we are enjoying its perfume and its beauty? Let us, then, be pleased to feel that we do not work, that we do not build, that we do not plant all our lives long for ourselves alone, however selfish we may be or appear to be; but that we work and build and plant that others may see our good works, *and that we may see others admire them.* All things that endure longer than ourselves are blessings to some body after we leave them; and when we act as if nothing is worth having which the great ego can not have exclusive possession of, the public is justified in wishing for one more first-class funeral, that the possessor of wealth who cared not to create beauty while living may at least brighten the verdure of the grass above his bones.

The Apiarian.

SOME NONSENSE ABOUT BEES.

It is seldom that we care to criticise anything which may appear in the columns of the various journals devoted to bee keeping. It is supposed, however, that specialists are better qualified to speak and write intelligently upon subjects to which they have paid particular attention than those who have not, but occasionally the reverse of this seems to be the result, and the hobby-horse with his rider gallops rough shod over both science and common sense.

This is the kind of a man we take the Rev. J. W. SHEARER to be, who has been contributing to the pages of the Bee Keepers' Magazine. The "game may not be worth the powder," but an article from his pen in the August number of the periodical named, contains some statements which are sufficiently amusing to be worth notice, even if they are not instructive, beyond showing what nonsense a man will write.

Generally, the class of writers to which we refer, begin their epistles by a reference to the first day of creation, or seldom at a later period than when ADAM and EVE left the Garden of Eden, and the Rev. J. W. SHEARER, unfortunately, is not an exception to the rule.

The title of his article is: "Enemies and Diseases of Bees," and the cause of these he evidently attributes to the sins of ADAM and EVE, for he says: "Since the curse pronounced upon sin, enmity is found not only between the seed of the woman and the seed of the serpent, but throughout nature the various classes of creatures all have their enemies and enmities." "When we reflect upon this thought, we see around us in these God-given instincts a part of the practical outworking of the curse pronounced against the earth for man's sake."

Now if our Reverend Gentleman will get some child's Entomological Primer, and read it carefully, he may learn that the reason why one insect preys upon another is because it was created to do just this very thing, and can no more help it than it can help breathing to live. The Ichneumon fly deposits her eggs in the body of some other insect, because she cannot perpetuate her species in any other manner, and when the gentleman endeavors to make out that these natural habits are the result of any act of our ancestors, he oversteps the bounds of truth, common sense, or traditional history. But we will leave him to believe whatever he chooses in this matter, and hastily glance at paragraphs further on.

In speaking of the "Bee Moth," he says: "The 'Moth Miller' is the peculiar enemy of the hive." Now, the terms "Moth" and "Miller" are synonymous, and are applied indiscriminately to hundreds of different species of both night and day flying lepidoptera. Some persons speak of them as moths, and others as millers, just as some farmers call their male sheep "rams" and others "bucks;" but no one knowing the animal would think of using both names and saying my ram buck sheep, which, however, would be no more ridiculous than calling either of our common species of Bee Moth (*Galleria*) a "Moth Miller."

Mr. QUIMBY, from whose work the Rev. S. appears to have drawn largely in writing the article in question, calls the larvæ of this insect the "Moth Worm," which is not an objectionable term, because the injury is done by the worm, or larva of a moth.

But we cannot spare the space to follow our would-be scientific apiarian through all his devious and doubtful wanderings, while drawing

good, practical sense from QUIMBY, to help fill up, adding nonsense to make the article appear original. There are, however, some few preventives of noxious insects which our essayist should have added to his list to make it complete, and among them an "ash stick cut in the full of the moon and hung up in the cellar, or your bedroom, will keep moths out of the orchard or apiary," and we will warrant it to be just as effectual as the following, which our Reverend Gentleman gives for ants: "Leaves of tansy, catnip or black walnut will drive them away. Pulverized borax scattered on the floor or in a cupboard will cause them to leave. Fine salt, or wood ashes, will have the same effect. But perhaps the best and most effective way to keep any sweets from ants is to make a good wide chalk mark around the jar, or on the legs of the bench upon which they are placed, as ants cannot cross a chalk mark. Hives may be thus protected by making marks around the legs of the stands, but they must be renewed after every rain. In the house the chalk mark will last for some time."

Following this, we have some "twaddle" about wasps, mice, bears and spiders, and are also advised to kill all toads (which, by the way, are the gardeners' and farmers' best friends,) found about the apiary, but the *rara avis* of this whole list appears in a sentence, in which we are told that the "Death's head Moth is not much known or troublesome in this country." Well! well! *Not much known?* We guess not. And when the Rev. J. W. S. finds a genuine Death's head Hawk-moth, (*Acherontia atropa*), sucking sweets from a hive in this country we hope he will favor us by capturing it and sending to the RURAL NEW-YORKER office, for it would be a welcome addition to the editor's cabinet, which only contains specimens of this moth caught in Europe. The Rev. J. W. S. sadly needs a vacation, and when he gets one it is to be hoped he will brush up his theology if it is as rusty as his entomology.

Domestic Economy.

STOVE PIPES AND SHED ROOFS.

Now I do not pretend to say that stove pipes are better than a chimney, or so good, but as it often becomes necessary to use them as substitutes for chimneys, they may be so adjusted as to become something else than a source of torment, as they usually are to the women folks, when they extend from shed roof, by the addition of a few extra joints of pipe—according to the hight of the main building—securely fastened to the roof with strong wire. It may seem a simple thing which everybody is supposed to understand, but that will do not I have abundant proof, as I have seen more than one housekeeper beclouded in smoke every time the wind changed from certain directions, and, indeed, have had some experience of that kind myself, which I do not care to repeat. And I have seen various devices for removing the evil, some of which are unsafe from fire, though they effect the desired object. But there is another annoyance from stove pipes, for which I know no remedy—except to always use good dry wood—and that is, the dripping of condensed vapor from the pipe. Has some one a remedy for that?

JULIA M. WHEELOCK.

ORIGINAL RECIPES.

Peach Preserves.—For every pound of peaches dissolve a pound of refined sugar in a little water; when skimmed clear, add the peeled peaches; boil until tender; remove them carefully that they may not break; boil the sirup down until thick enough; then put back the peaches for a few moments to mix all together; put into air-tight jars and seal while hot. If the fruit is cut in halves or quarters, crack the pits of half the peaches and boil in the sirup; then strain and cook in the usual way. The flavor of the pits adds very much to the deliciousness of the preserves.

Peach Cobbler.—Pare nice, ripe, juicy peaches, lay them in a deep baking dish, with plenty of sugar, and a tablespoonful of flour rubbed smooth in a little cold water. Cover the top with a crust made of one teacup of sweet milk, a little salt, one heaping tablespoonful of butter, one heaping teaspoonful of baking powder, worked thoroughly through flour enough to make a soft dough. Rub the butter through the flour; add the milk; mix quickly; roll out an inch thick, and bake in a moderate oven. To be eaten with cream and sugar, or wine sauce. A crust made as the above is far more wholesome and digestible than ordinary paste made of water and *abominable lard.* MRS. RUSTIC.

Utility.—Amid all the vast trouble and expense of dressing now-a-days, I am astonished and pleased to see the common-sense white or marbled table cover so much in vogue, which can be wiped off with a clean cloth, and thus be made fresh and clean at each meal. Put on your damask linen when you choose, but when there is necessity of economizing the washing, these enameled covers are much nicer than I thought before using them. I at first told JENNIE I could not admit them on my table; but now approve of them. AUNT FLORA.

Wanted—Method for making Medley Pictures.—Will some lady reader of the RURAL explain the modus operandi of making medley pictures (to be framed) from small steel engravings, and greatly oblige a subscriber. B. M. F.

A Recipe for Brandy Peaches Wanted.—Will some lady reader of the RURAL give a recipe for brandy peaches, and oblige a constant reader of its columns. J. C.

SELECTED RECIPES.

Peach Jelly.—Wipe the down well off your peaches, which should be free stones, and not too ripe, cut them in quarters, crack the stones, and break the kernels small. Put the peaches and kernels into a covered jar; set them into a kettle of boiling water, and let them boil till they are soft; strain them through a jelly-bag; allow a pound of loaf-sugar to a pint of juice; put the juice into a preserving kettle and boil fifteen or twenty minutes briskly; then add the sugar, and let it dissolve; skim carefully; pour the jelly into glasses; when cold, cover with thick paper.

Ginger Wine.—Boil together for half-an-hour seven quarts of water, six pounds of sugar, two ounces of the best ginger, bruised, and the rinds of three good-sized lemons. When lukewarm, put the whole into a cask with the juice of the lemons, and a quarter of a pound of sun raisins; add one spoonful of new yeast, and stir the wine every day for ten days. When the fermentation has ceased, add half an ounce of isinglass and half a pint of brandy; bung close, and in about two months it will be fit to bottle.

Sugar Beer.—Mash one peck of bran in ten gallons of boiling water for two hours; draw off the wort, add seven pounds of moist sugar, and boil it with a quarter of a pound of hops; then cool it down and add a little yeast; it may be put into the cask next day, and in three days more it may be bunged down. At the expiration of six or eight days it will be fit to drink.

To Obtain a Soap for Removing Grease Spots.—Dissolve in half a pint of water half a pound of washing soda, put in two pounds of good hard soap, cut in slices, and boil until a homogeneous mass is formed; then add alcohol, camphor, ether, and liquid ammonia, half an ounce of each, and mould it into cakes.

Grill Sauce.—Take one gill of good gravy, mix it with one tablespoonful of mushroom catsup, one of French mustard, a few chopped capers, a little grated lemon peel; add a thickening of butter and flour and a few drops of lemon juice; simmer till quite hot; pour over the grill and serve.

New England Corn Cake.—One quart sour milk, three eggs, one teaspoonful of soda, one teacup of flour, yellow corn-meal enough to make a batter as thick as pancake. Bake quickly in pans well buttered.

Hygienic Information.

SHALL WE EAT PORK?

MOST people will say "no, if we can get beef, mutton, poultry or wild game, or, in fact, any other popular flesh." I do not, myself, think it the most desirable meat, especially if eaten under protest, and still the elements of the fat part of it being mainly oxygen, hydrogen and carbon, are among the most important ones in the foods of all carnivorous or omnivorous animals. They are the elements of sugar, which is one of the most important compounds in the foods of young mammals and young edible plants.

But, says one, it produces scrofula. It is true that that or some other foods, or some peculiar habits, produce this disease sometimes in persons, and that is all that anybody knows about it, so far as I can learn.

It is said that the devil entered the swine when cast out of the insane men. True, but those swine were all drowned in the sea, and, since that time, there is more evidence of his presence in many of the human species than in swine.

Says another: "Fat pork does not furnish the materials to form bone, muscle, tendon or hair;" [don't put it on your heads, then, under the name of bear's grease.] I admit that it does not furnish lime, phosphorus, nitrogen and sulphur, but it does furnish materials fully as essential in our economy, the heat-producing elements; for man may live many days without food; but the moment his fuel fails, as in consumption, he dies. I by no means advocate an exclusive pork diet. Man is omnivorous and he needs acids, and the food which furnishes them or their elements is essential to his health; especially does he need them to assist in the digestion of flesh.

The appetite of a healthy man calls for a mixture of the carbonaceous and nitrogenous foods; he wants pork with his beans and peas; butter, gravy, or cheese with his bread and vegetables. A taste for this combination is evidence of health, especially if he labors in the open air and produces sensible perspiration. Says another: "He does not need heat-producing foods when laboring in the harvest field." These would seem to be prima-facie evidence that when the summer heat is up to the nineties, we do not need heat-forming foods; but "facts are stubborn things." In old times in New England I have often seen old harvest hands come in to dinner, with garments wet with sweat, and eat a hearty dinner of fat salt pork and potato, with perhaps a little vinegar or a pickle, and have often heard them say: "This is the best standby for such weather and work as this;" and it has been a saying with some: "Fat pork and old cheese are the most reliable food for hot weather." Now, how is this? In the absence of any authority for an explanation I will attempt it.

There can be no doubt that that kind of food which produces heat will, when the body is heated up to a certain degree, promote sensible perspiration—the means provided by nature for taking off any excess of heat above what the body can bear. This is a safety valve, without which, no man can endure the labor of harvest under our broiling suns, and I see no way of accounting for the good effect of carbonaceous food to the hard out-door laborer in hot weather except that the extra heat it produces is more than compensated by the extra evaporation from the perspiration it causes. Of the good effects of a diet consisting partially of fat meat, under such circumstances, and especially when relished, I have not a shadow of doubt; but I do not believe in eating pork or any other food when not relished; but it is well for farmers who dislike it, and to whom it is a more convenient and less expensive food than any other meat, to ascertain whether this dislike is natural or is the effect of prejudice, for if only the latter, it may be overcome.

I know that with myself there have, especially in youth, been times when I relished it and times when I did not, and I presume such is the experience of many farmers' boys; and I have noticed that often those who generally dislike it relish and eat it with avidity after sickness, when the fat of the body has been greatly reduced. As to this particular kind of meat, I am not aware that it is any less healthy than any other meat if as well relished, though I know that the contrary opinion is held by many. That the elements contained in fat meat are essential to sound, vigorous health, I quote from the New York Observer of April 15, 1858.

"A prominent physician of one of the Eastern States has the following in his report to American Medical Association relative to the diet:—Of all persons between the ages of 18 and 22, more than one-fifth eat no fat meat. Of persons at the age of 45, all except one in 50 habitually eat fat meat. Of persons who, between the ages of 15 and 23, avoid fat meat, a few acquire an appetite for it and live to a good old age, while the greater portion die with phthisis before 35. Of persons dying with phthisis between the ages of 15 and 45, nine-tenths, at least, have never used fat meat. Most persons who avoid fat meat also use little butter or oily gravies, though many compensate for this want by a free use of those articles, and also milk, eggs and various saccharine substances, but they constitute an imperfect substitute for fat meat, without which, sooner or later, the body is almost sure to show the effects of deficient colorification."

At another time I may say more on this subject, for I consider it an important one.

Muskegon, Mich. S. B. PECK.

EVERY MOTHER OUGHT TO KNOW IT.

So said my neighbor, after having suffered for several days from a painfully swollen breast, and having used the following prescription with the best result. Take of best castile soap (best laundry will do) one-quarter of a pound; shave fine; mix with sweet milk and a little sugar; heat till melted; then cool a little; spread on a thick cloth; place upon the breast, while yet warm, in the form of a poultice; melt over or put on a new poultice, if one does not entirely relieve the pain and swelling. Try it, mothers who are thus afflicted. A. F.

POISONED FACE.—My little grandson had such a badly-poisoned face that he could not see, so I led him into my room, and I hardly knew what to do for it, but while I was preparing an application to kill the poison, I applied common glycerine, in order to soothe the little fellow in the quickest manner, when he immediately fell asleep so sweetly that I laid by the other preparation and waited to see the result, which was far better than I expected. When he awoke, he opened his eyes comfortably, and needed no other preparation to effect a perfect cure. A. F.

Around the Republic.

SHADY SIDE OF TEXAS.

ED. RURAL:—In the RURAL NEW-YORKER of July 8, I noticed a communication from my neighbor Dr. BEACH entitled "Glimpses of Texas," giving a view of Texas as seen through his "glasses," while in an adjoining column there appeared a very glowing account of Texas. Now, after pondering over both articles, I fell to musing on the subject, wondering why it was that correspondents should so universally fall into the habit of painting their surroundings in such glowing colors.

It must be that they always put on their highest magnifiers when writing for the press, else their other set of glasses are always out of repair or broken when needed for such labor.

Something of this kind must have happened the low-power spectacles of Dr. BEACH, for he never could have intended to give any one a magnified idea of the productions or the climate of Texas, still he must in this instance have overlooked the old axiom that "circumstances alter cases." For instance, he says "Texas cannot be excelled for healthfulness." Well, I will take a look at this assertion through my own glasses and see how it appears to me.

Here is a man from one of those bone-yards of the world, viz., the swamps of Louisiana. His cheeks are ruddy; he has the glow of health in his eye; he walks erect and declares this is the healthiest country in the world. Furthermore, he must write it to "all men," for it is the truth as seen through his glasses.

But now another man comes upon the scene who is from the Northeastern States. He has plenty of this world's goods and is doing well, with a large family in excellent health; he has plenty of books to read, churches and schools are near by; but a hard winter makes him discontented after reading the glowing description of some far-off land where the climate is but little less than a genial spring throughout the entire year. He reads all this, perhaps, in the RURAL NEW-YORKER, and his wife and children listen with interest to the tale, and a family council soon decides that the best thing to do is to sell out and go, and this is done at a great sacrifice, for it will not pay to take old furniture, however good or valuable, to such distant regions.

In good time they reach the "promised land," and the man either rents or buys a farm and goes to work. All is well for a time and the family satisfied, for it really appears that they have made a wonderful bargain; but in June or July another change comes over the scene and the hydra-headed monster *Malaria* stalks forth, and soon father, mother and children look as though they had taken a "saffron bath," and the congestive chills which follow are anything but pleasant, if nothing worse results, as malarial fevers seldom end by leaving the entire family alive. The father soon becomes disheartened with departing health and strength, and he curses the day he first heard of Texas.

I have had an opportunity of seeing both the bright and dark sides of this region of country, and therefore do not speak at random.

Again, Dr. BEACH says "the numerous herds of cattle and sheep driven out of Texas have had no taste of other food than grass; but why did not the Doctor tell us that in the winter of 1873-4 some herds of 1,600 head came out in the spring with less than half of their number alive, and that hundreds and thousands of cattle perished in that winter from starvation caused by a scarcity of food in consequence of a drought the season previous?

Last summer we had no rain from the 25th of April until the 7th of August, and the whole country has been buying corn from the North at $1 per bushel.

The Doctor also talks of wheat as though he had plenty, but I will venture to say there has not been fifty bushels raised in the section in which he lives during the past four years. North and west of here they raise some, and in a few locations in the State fair crops of this grain are raised. Then he tells us that he raises two crops of Irish potatoes in a season, three of turnips and two of cabbages. I have planted $15 worth of Irish potatoes, and two bushel baskets would hold all I ever raised, and none larger than hickory nuts, and I consider myself a fair farmer, but not a rich one, or perhaps as successful as some who count upon things not obtained but expected.

It is an exception to the general rule to raise good vegetables, while apples and similar fruits are almost an impossibility. Peaches dry up in summer or are cut off by frosts in spring. Now, I am not disposed to say there is nothing good in Texas, but simply wish to give a view of the country as seen through *my* glasses, knowing that I have plenty of neighbors who see it in the same light. Gonzales, Texas.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

ANDREW S. FULLER, Editor.

ELBERT S. CARMAN, - - Associate Editor.

X. A. WILLARD, A. M., Little Falls, N. Y.,
EDITOR OF THE DEPARTMENT OF DAIRY HUSBANDRY.

G. A. C. BARNETT, Publisher.

TERMS FOR 1876, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.65 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $13.40; Seven Copies, and one free, for $17.20; Ten Copies, and one free, $21.50—only $2.15 per copy. The above rates *include postage* (under the new law,) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra—or $3.50 in all. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)	.60c.	per line.
" 13th page	.70	"
Outside or last page	1.00	"
Fifty per cent. extra for unusual display.		
Special Notices, leaded, by count	1.25	"
Business "	1.50	"
Reading "	2.00	"

Discount on 4 insertions, 10 per ct.; 8 ins., 15 per ct.; 13 ins., 20 per ct.; 26 ins., 25 per ct.; 52 ins., 33⅓ per ct.

SATURDAY, AUG. 26, 1876.

THANK YOU.

IT is surprising how much a little oil of politeness lubricates the wheels of society, making the whole vast amount of intricate machinery move easily and with little friction. No matter whether at home, in business, or in social intercourse with those in our service, friends and acquaintances, the result is the same. And when such good results obtain with so little expenditure of thought or labor, is it not strange that their attainment is not more often made the object of our attention. A kind look or word often makes it a pleasure for us to do that which, otherwise, would be a task or duty performed with the feeling of *must* resting heavily upon us.

A child leaves its play to obey an injunction to shut the door much more readily if spoken in a kindly tone, and preceded or followed by "Please:" and the gratification we receive when we have done any little service for another is greatly increased if it be acknowledged by a simple "Thank you." Perhaps we are satisfied the feeling is there, but to have it expressed is always pleasant. "JOHN," said a mother to her little boy, "did you thank the lady who gave you the orange?" "Yes, mother," was the reply, "I thanked her, but I didn't tell her so." A while ago a train of the Hudson River Railroad on which the writer was a passenger, stopped at one of the smaller stations and a joyful party of young people entered. Vacant single seats seemed plenty in the car, but they appeared desirous of keeping very near each other, as was natural, and seeing that we could aid them in the matter we arose and addressing a buxom, rosy-faced lass who stood near said, "Take this seat, please; perhaps we can find one elsewhere." She looked gladness and replied, "Wal, likely's not you can." We doubt not there was plenty of "Thank you" in her heart, but its expression in words would have been eminently proper.

There are persons who, apparently, feel as if one doing them a favor or a kindness must know their estimate thereof, and to whom vocal expressions of thankfulness seem fulsome and a waste of words. This is a mistake that sometimes leads to serious misunderstandings. We once heard it said of a young lady, "She receives a favor as if it was a right to which she was entitled by reason of some quality inherent in her organization, and for which she is not under the least obligation, either for the deed, or the kind feeling that actuates it." An intimate acquaintance with the lady enables us to know how far from fact this seeming is; still, we can but feel that this lack of proper recognition of friendly acts is a fault in her character that should be conceded.

Suavity, agreeableness, politeness, can be lavishly sprinkled along our daily walks with great advantage. No matter what rank, station or position one occupies, or what is to be said or done, these qualities are never without their good effects. On the farm or in the workshop, the respect of the employer is gained by pleasant words, and an order or direction from him loses none of its force for being put in the form of a request.

It was said of HENRY CLAY that his manner was so agreeable, he could refuse a request and send the applicant away with kinder feelings toward him than many could after granting the desired favor.

Nor should the spirit of politeness be confined to words only. There are little things to be done one for another, that add immensely to the happiness of the human family. What STERNE calls "The small, sweet courtesies of life," things which, of minor importance in themselves, can be done in such a way as to brighten everything around and, like Mercy, bless him who gives and him who takes. And this should be a maxim for young and old, "Never, when it can be avoided, say or do anything that will not add to the happiness of some one or more of those around you." Show that you care for others by giving them better attention and having their pleasure and comfort always in mind.

The school in which these lessons should be first taught is home; and unless they are taught here, it is seldom they are ever perfectly learned. And home is the place where they should be put in practice, so soon as the child can speak, or before. The language of the mother is copied by the child in all its words, forms, accents and tones; her acts are looked upon as entirely proper, and to follow her example, both in word and deed, becomes so much a part of the child's nature as to be difficult of change in riper years. Here a mother's influence is easily exerted for good or ill. Little things have a lasting power, and there is much truth in the simple lines:

"Little words of kindness,
Little deeds of love,
Make this earth an Eden,
Like the heavens above."

"SKINNERS."

A GENTLEMAN, not long since, in reply to our question of the cause of so many poor looking farms in his section of the country said, "These farmers about here have been skinning their land for a good many years and now their land is skinning them." The truth of the remark was so apparent, that we could not fail to recognize it at once. Unfortunately, this skinning process is not confined to any particular section of the country nor any one set of farmers. We find it more or less wherever we travel, and always deplore it. Our informant continued:—"There is more good manure and labor wasted every year on the farm before us than would be required to keep the place constantly up to its original standard and value. That place, fifty years ago, was worth one hundred dollars an acre and now it would be difficult to get fifty for it."

There is nothing more certain than that land will soon wear out by this process of "skinning," and yet so many of our farmers fail to look ahead far enough to see it. Adjoining the farm of which we were speaking was another, and while the lay of the land appeared to be no better and its original natural advantages no greater, it was in a thrifty condition and yielded its owner a good living and something for a rainy day. "Now there," continued our friend, "is a farm cultivated by an intelligent man who reads and studies his business, and gets not only the benefit of his own experience but that of others. His neighbors used to laugh at him for his experiments; but now they try to find out his "secret," as they call it, of getting the larger crops. One of his neighbors watched him plant his corn one year for the purpose of discovering how he secured a crop double that of his fellow farmers in that section. He discovered that he mixed the little red corn with it in the proportion of about a quart to the bushel. He had the secret, and immediately did the same himself. Alas, for human hopes! He did not increase his yield, and was obliged to fall back on nature by saying that the other farm was better than his own. And such, indeed, was the fact; not by nature, however, but by proper cultivation and renewing."

Let us suppose that poor farm No. 1 had not cost its owner a cent in fertilization and renewing in fifteen years and that good farm No. 2 had cost its owner in the same time fifty dollars per acre for that purpose; No. 2 is, to-day, worth fifty dollars per acre more and has uniformly produced much heavier crops, which were the net profit of the extra cultivation. Even if the careless farmer had actually put aside the money which the other put into his land, (a thing that seldom happens in such cases,) still the careful cultivator would come out ahead at the end of fifteen years.

Few men would think of entering one of the learned professions without years of preparatory study and constantly keep pace afterwards with the progress made by the rest of the world in his particular profession. Yet we will venture to assert that neither law, medicine nor ministry can ever present as many difficulties at every step nor as many daily obstacles to complete success, as the cultivation of the soil. Still, who ever thinks of educating a man to be a farmer? What need is there of a boy knowing more than his father knew before him about farming? Did not his father pay off the mortgage on the place, accumulate a snug little sum to care for him in his old age, and give his children a start in the world? All very true! But if, by a little extra care, study and thought, he could have accumulated more and, instead of causing two blades of grass to grow where but one grew before he could have caused *five* to grow, he would have but done his duty and faithfully performed the trust imposed upon him by his Creator.

One of the best commentaries we have heard upon the section of the country spoken of and upon "skinning" generally, was inadvertently made by a man who had given up farming as unprofitable. Some one very rudely remarked upon his bent form and stoop shoulders. "Ah," said he, "treat that tenderly, for I got that in trying to make a living out of a hundred acre farm in this part of the country." And this man as a farmer was a total failure. He worked incessantly and studied and read none, and so he was a failure.

RURAL NOTES.

Plagiarism. — "My attention was lately drawn to the manner in which plagiarists sometimes escape detection, and then occasionally get detected at last. I saw 'Experience with Bees,' (written by JULIA M. WHEELOCK, who has written for no other paper but the RURAL NEW-YORKER, whose 'Experience with Bees' was published during the summer of 1875,) credited to the Patron's Helper. I suppose this mistake to have occurred by no credit being given when the first 'copy' was taken from the RURAL NEW-YORKER, which must have been a violation of courtesy among journalists. It makes no difference with the writer, but the question is, Is it right?—J. M. W." We had our say upon this subject a week or two since, and have nothing further to add except reminding our correspondents and readers generally that if ever the day comes in which there is no pilfering, honesty will be too cheap and common to be fully appreciated.

Cats vs. Robins.—A correspondent of the Maine Farmer is very indignant that so many people will keep cats, and says that if it was not for the cat, "we would have in a few years fifty robins where we now have one." He then proceeds to show the great good which this bird is capable of doing the farmer in the way of killing various kinds of insects. In direct opposition to this claim a correspondent of the Country Gentleman asserts that if the law which now protects the robin and other insectivorous birds is not soon repealed, or the robin be excepted, the cultivation of small fruits will have to be abandoned in Central New York. He also urges that a bounty be offered to encourage the killing of robins, as they are known to be fond of berries and other small fruits. The doctors in this instance disagree and, we ask, "Who will decide?"

Selecting Seed Wheat.—Farmers throughout the country should be thinking of their seed wheat. There is nothing gained by sowing a poor article, and a man had better pay double the ordinary market price for seeds which are plump, sound, and free from cockle and other foul seeds. If there is danger of insect depredations or the land is not very rich, then soaking in bluestone or brine may often be resorted to with benefit. But in regard to sowing wheat early or late, there must be some judgment used, for in localities where the Hessian fly abounds, late sowing is about the only preventive.

National Agricultural Congress.—Those of our readers who can make it convenient to be in Philadelphia on Sept. 12–14, should do so and attend the meeting of the National Ag. Congress. Addresses will be delivered by the President of the Society, Hon. W. C. FLAGG of Illinois, Secretary G. E. MORROW of Iowa, JOSEPH HARRIS of New York, X. A. WILLARD, Dairy Editor of the RURAL NEW-YORKER, J. R. DODGE of Washington, Dr. E. L. STURTEVANT of Massachusetts, L. F. ALLEN of New York, and other prominent agriculturists from the different States of the Union.

RURAL BREVITIES.

E. GRISAR & Co., San Francisco, Cal., send us with their compliments, the S. F. Journal of Commerce and Price Current. Thanks.

VICK, the chartered Seedsman and Florist of the Flower City (Rochester), is again "around," as will be seen by his Autumnal announcement in this paper.

THE wholesale fruit dealers in Chicago propose to get up a Show this fall that will eclipse anything of the kind ever seen in this country. We wish them success.

MR. CHAS. RAY, Moravia, N. Y., is now, substantially, the Moravia Citizen, having submerged his individuality in the potent "we." Both himself and paper are good "Citizens."

THE Methodist Church of Greeley, Col., is engaged in agricultural pursuits, it having this season forty acres of wheat, with which it hopes to pay off a portion of its debts. This is more commendable than holding church fairs, at which gambling of various kinds is encouraged and permitted.

THE NEW YORK PLOW CO., 55 Beekman St., N. Y., make a timely announcement in another column concerning their Cast-Iron Cider Press Screw. To those who know this Company, it is needless to speak in regard to the excellence of their manufactures. A perusal of their Catalogue (which will be sent *free*) may suggest various wants.

WE beg to acknowledge the receipt of The Liverpool Critic, published at Liverpool, England, by Messrs. ORCHARD & ANDERSON. Both the gentlemen were formerly connected with the Leader of the above city. They make a bright, readable paper, although a weekly journal, there is no "a" in Critic, and it can, therefore, never become weakly.

THE food "alarmists" having scared many persons out of the practice of using brown sugars by reporting that they were in the main full of a species of mite, a would-be scientist is now trying to make us believe that refined sugars are poisonous. What next, gentlemen? We await patiently further discoveries, and in the meantime are thankful that "we still live!"

FLOODING our sanctum with its opulent rays comes the Golden Dawn, from San Francisco, Cal. It is an excellent Dawn, being devoted to the fair. DORA DARMOORE and ADA HUTCHINS are Publishers and Proprietors. Miss DARMOORE coins her brain, while Miss HUTCHINS, by her business tact, deflects the Dawn, yclept Golden, into the cash drawer. Success to them!

A BAND of 800 Mormons, recently arrived from Europe, have started for Utah via the Pennsylvania railroad. Some of the men have as many as eight wives. So says an Exchange. But it would be interesting to know from what country these Mormons came and where a man, outside of Utah, is permitted to marry eight wives. Truth and common sense should rule, even when talking about the Latter Day Saints.

A VISION OF A HOT DAY.

I saw a tutor take his tube
The comet's course to spy;
I heard a scream—the gathered rays
Had stewed the tutor's eye.
I saw a fort—the soldiers all
Were armed with goggles green;
Pop! cracked the guns; whiz! flew the balls;
Bang! went the magazine.

I saw a poet dip a scroll
Each moment in a tub;
I read upon the warping back
"The dream of Beelzebub."
He could not see his verses burn,
Although his brain was fried,
And ever and anon he went
To wet them as they dried.

I saw the scalding pitch roll down
The crackling, sweating pines,
And streams of smoke like water spouts
Burst through the rumbling mines;
I asked the firemen why they made
Such noise about the town;
They answered not, but all the time
The brakes went up and down.

I saw a roasting pullet sit
Upon a baking egg;
I saw a cripple scorch his hand
Extinguishing his leg;
I saw nine geese upon the wing
Towards the frozen pole,
And every mother's gosling fell
Crisped to a crackling coal.

I saw the ox that browsed the grass
Writhe in the blistering rays;
The herbage in his shrinking jaws
Was all a fiery blaze;
I saw huge fishes, boiled to rags,
Bob through the bubbling brine,
And thoughts of supper crossed my soul;
I had been rash at mine.

Strange sights! strange sounds! O fearful dream!
Its memory haunts me still;
The steaming sun, the crimson glare
That wreathed each wooded hill.
Stranger, if through thy reeling brain
Such midnight visions sweep,
Spare, spare, O spare thine evening meal,
And sweet shall be thy sleep.

[*Oliver Wendell Holmes.*

Historical.

OUR COUNTRY;
ITS ACQUISITION AND DIVISION.

BY LESTER A. ROBERTS.

[Continued from page 125.]

VERMONT.—The territory now known as the State of Vermont, offered little inducement for early settlement. The mountains were climbed and the valleys crossed by New England men during the wars with the Canadian French, at which time the French, the Indians and the English occupied it in turn, or as was sometimes the case, together. Massachusetts laid claim to some portion of the territory and in 1716 made some grants. In 1724 a few settlers took possession and made the first settlement on the Connecticut river, building Fort Dummer, where is now the south-east corner of Brattleboro. Their example was not largely followed. On the establishment of the boundary line between Massachusetts and New Hampshire, it was declared to run due west until it met His Majesty's other governments. This left Fort Dummer outside the jurisdiction of Massachusetts; but the then Governor of New Hampshire, BENNING WENTWORTH, assumed that the jurisdiction of his State extended as far west as did that of Massachusetts—*i. e.*, to within twenty miles of the Hudson river; and acting on this assumption, he granted to some friends a tract of land, including the present town of Bennington, named in his honor. He afterward made further grants, to friends and others, for a consideration, and as he always reserved from each township, beside a lot for the church, 500 acres for himself, together with certain fees and other emoluments, it is supposed he made a very good thing of it.

After the peace of 1760 and the abandonment by the French of all the Mont Verd region, immigration commenced and before 1768 138 townships had been located and settled. The whole country at that time was known as the New Hampshire grants.

As early as 1763 New York began to look upon the territory with a covetous eye, and hunting up musty records found that by charters of CHARLES II. in 1664–74, New York extended from the west bank of the Connecticut river to the Delaware. Massachusetts and Connecticut had never respected this charter, as previous ones gave them territory much further west. Proclamations were made by the Governors of New York and New Hampshire respectively, which resulted in nothing, as do proclamations usually. New York appealed to the King and, it is said, fortified the appeal by forging the names of the principal settlers to a petition, and in 1764 His Majesty declared the west bank of the Connecticut *To be* the boundary line between the two States.

Then arose a quarrel as to what *to be* meant. New York claimed it was the same as always has been, and declared the grants made by New Hampshire invalid, claiming not only jurisdiction but absolute fee of the land, and commenced suits of dispossession and ejectment against the settlers.

At this point New Hampshire retired from the game, leaving the settlers to play it alone, and they were equal to the task. They had among them some representative men as SETH WARNER of Revolutionary renown, ETHAN ALLEN, of "The Great JEHOVAH and Continental Congress" memory, and others of the same stamp—bold, daring, fearless; believing implicitly in the right, caring nothing for the majesty of the law when they believed the law unjust, and depending on themselves and the truth against the world.

They did indeed make their representations to the King, showing they had purchased and paid for their lands in good faith, and finally obtained his order to New York to discontinue proceedings; but the order was disregarded, and New York passed a law making it a criminal act punishable by death, for a settler to make any opposition to her claims. ALLEN, at the request of his fellow settlers went, with a lawyer (INGERSOLL of Connecticut) and proofs of purchase to Albany, hoping for a fair hearing; but the case was already decided even before the hearing commenced. The courts were in the interests of speculators and, not only defeated but ridiculed, ALLEN left the court exclaiming, "The gods of the valleys are not the gods of the hills."

The settlers saw nothing was left for them but to protect their rights in their own way. The officers, who were soon sent to dispossess them, were met by the settlers. Those who promised to desist and return home were not harmed; but those who endeavored to carry out the objects of their mission were soundly flogged with beech switches. This was called affixing the beech seal to the deeds of their property. Soon no officer dared show himself to the Green Mountain boys, and the Governor of New York offered by proclamation £100 for the capture of ALLEN and £50 each for several of his chief supporters. They replied by proclamation, offering £5 for the Attorney-General of New York, adding they thought that sum all he was worth.

As the troubles increased officers were more roughly handled and New York cited ALLEN and his companions to appear for trial and informed them that, failing to appear, they would be adjudged guilty and sentence be passed as if they were present. They replied with a notice that if any officer or other person should attempt to arrest them, he should suffer immediate death—"By authority of the Green Mountain boys." And so the quarrel continued until the breaking out of the War of the Revolution, which gave to New York matters more important to attend to.

The settlers then (in 1776) petitioned Congress to be admitted to the Confederacy, but New York opposing, the admission was denied.

In 1777 they declared themselves independent of all Governments, adopted a Constitution, and claimed the territory bounded on the west by Lake Champlain and the Hudson river so far south as the Massachusetts line. Not belonging to the Confederation, they were not looked upon by the British Government as a revolted colony, and the leaders were repeatedly solicited by British officers to join them. But they steadily refused all offers of position, preferment or emolument. They were not to be bought.

In 1781 Congress offered them admission but with bounds somewhat curtailed. The offer was refused and the people remained independent until 1790, when New York began to desire a settlement and offered to surrender jurisdiction and all claims to land within the present limits of the State on receipt of $30,000. The offer was accepted and in 1791 the State of Vermont was admitted to the Union. In consequence of some misunderstanding, the present boundary lines were not definitely fixed until 1812.

KENTUCKY.

West of Virginia was a large territory known to the Indians as Kentucky—meaning, in their language, "The dark and bloody ground." Of this region but little was known previous to 1769. BUTLER, in his history of Kentucky, says: "In their frequent peregrinations and trading expeditions through the vast territory between the Ohio and Tennessee rivers, the first traders, hunters and explorers never found within that extent of country a single wigwam or modern Indian village. The Indian settlements nearest to the frontier border of the Carolinas and of southwest Virginia were on the Scioto and Miami in the north and on the waters of the little Tennessee in the South. From these points the various war or hunting parties issued to engage in the one or the other pursuit, as the passion or the opportunities of their expedition might lead. Here the Choctaws, Chickasaws or Cherokees of the south used to engage with the various tribes of the Miami's Confederacy of the North; here they indulged their passion for hunting in the profusion of game afforded by Kentucky and Tennessee. That part of these two States embraced within the boundaries mentioned was one great park, where the skill of the uncivilized hunter was practiced in a central theater upon which the desperate conflicts of savage warfare and bloody rivalry were perpetrated.

"By common agreement this whole country seems to have been reserved for these purposes from permanent occupancy, and so much was it exempted from settlement that south of the Ohio and north and east of the Tennessee it is not known that a single village was settled by the Indians. Yet no situations have generally delighted savage tribes so much as the margins of water courses, the opportunities of navigation and of fishing inviting to attract them to such spots. Some known and acknowledged inhibition must have, therefore, prevented settlement and possession of this great Mesopotamia. What was it? On this subject tradition and history are alike unsatisfactory."

Although some portions of Kentucky had been visited by white people previous to 1769, no attempt at any systematic explanation had been made until that year, when DANIEL BOONE—and a year later Col. JAMES KNOX—entered the territory. The former with a party traversed the north and middle regions, and KNOX with his companions, visited the middle and southern part. Both companies remained about two years and returning spread such accounts of the fertility of the soil through the western settlements of Virginia and North Carolina as to incite others to visit that country, particularly those who, having served throughout the late war, were entitled to bounty lands that were to be located upon the western waters.

In 1774 Col. RICHARD HENDERSON purchased from the Indians a large tract of country south and east of the Kentucky river, embracing lands which are now portions of Kentucky, Virginia, Tennessee and North Carolina. He immediately set about colonizing it; formed the Transylvania Company and by various means induced immigration. BOONE was employed as surveyor and in 1775 Boonsboro was located and founded. In the same year BOONE was joined by his wife and two daughters, who were the first white women that ever stood on the shores of the Kentucky.

The affairs of the Transylvania Company were progressing happily when the Legislatures of the States of Virginia and North Carolina took the matter of the purchase into consideration and determined that the right of jurisdiction and if not the fee, then certainly the sole right to purchase Indian territory vested in the State adjoining, and that while the sale by the Indians to HENDERSON extinguished their title, it gave none to him. Consequently, the settlers who had purchased from HENDERSON or the Company, found themselves in an unpleasant position. They had parted with their money but had secured no land. After considerable negotiation, it was determined that whereas HENDERSON had benefited the States by extinguishing the Indian title, the States should quit claim to the purchasers from him, and he should retain the money he had received.

This arrangement having been made immigration, which had for a time nearly ceased, again commenced. In 1776 Kentucky County was formed. In 1780 three counties were made which were in 1783 erected into into a Judicial District with a Civil and Criminal Court.

As population increased necessity for a government separate from Virginia became apparent and a petition for the same was presented to the Virginia Legislature in 1787. But little objection was made and a grant of separation was voted, dependent on the action of a convention of Kentucky to be called and the consent of the Federal Congress.

And now arose much confusion, consequent on Spanish claims to the navigation of the Mississippi river which, as it involved the whole of the Mississippi Valley, will be considered at length a little further on.

Kentucky for several years was in a curious condition. Indian forays, which were frequent, were devastating her frontier settlements, and Virginia gave no assistance toward preventing them—in fact, paid little attention to the settlers in any way. Several conventions were called, but for one cause or another, adjourned without effecting any result; but at last matters had reached a point where action could no longer be postponed, and the eighth convention was called in 1890 which, on the 4th of February, 1791, formally accepted the terms of an act of separation that had been passed by Virginia at the earnest request of President WASHINGTON, and Kentucky was admitted by Congress to be a State of the Federal Union on and after the first day of June of that year.—[To be continued.

The Story-Teller.

A RIDE IN THE FLUME.

THE following account of a ride in a flume by Mr. WILLIAMS, in the "Pacific Tourist," is sufficiently exciting to answer the requirements of the most exacting romance. We give it in his own words:

The flume is a wonderful piece of engineering work. It is built wholly upon trestle-work and stringers; there is not a cut in the whole distance and the grade is so heavy that there is little danger of a jam.

The trestle-work is very substantial and is undoubtedly strong enough to support a narrow gauge railway. It runs over foot-hills, through valleys, around mountains and across canons.

In one place it is 70 feet high. The highest point of the flume from the plain is 3,700 feet, and on an air line, from beginning to end, the distance is eight miles, the course thus taking up seven miles in twists and turns. The trestle-work is thoroughly braced, longitudinally and across, so that no break can extend farther than a single box, which is 16 feet; all the main supports, which are five feet apart, are firmly set in mud-sills, and the boxes or troughs rest in brackets four feet apart. These again rest upon substantial stringers. The grade of the flume is between 1,600 and 2,000 feet from the top to lower end, a distance of 15 miles.

The sharpest fall is three feet in six. There are two reservoirs from which the flume is fed. One is 1,100 feet long and the other 600 feet. A ditch nearly two miles long, takes the water to the first reservoir, whence it is conveyed 3¼ miles to the flume through a feeder capable of carrying 450 inches of water.

The whole flume was built in ten weeks. In that time all the trestle-work, stringers and boxes were put in place. About 200 men were employed on it at one time, being divided into four gangs. It required 2,000,000 feet of lumber, but the item which astonished me most was that there were 28 tons—or 56,000 pounds—of *nails*, used in the construction of this flume.

To the lower mill, as the road goes, it is about 40 miles from Virginia City. Although I had already ridden this distance, yet I mounted a horse and rode two or three miles to the top of the mountain, where I had one of the finest valley views that come to the lot of man. Miles and miles below, the valley was spread out with spots and squares of green crops growing and barren wastes of sand and sage brush reaching in a long stretch to the base of another spur of the Sierras. The City of Reno occupied a little spot on the plain; from my mountain it seemed like a city of toy houses built on Nature's carpet.

Upon my return I found that Mr. Flood and Mr. Fair had arranged for a ride in the flume, and I was challenged to go with them. Indeed, the proposition was put in the form of a challenge—they dared me to go.

I thought that if men worth $25,000,000 or $30,000,000 apiece, could afford to risk their lives, I could afford to risk mine, which was not worth half as much.

So I accepted the challenge and two *boats* were ordered. These were nothing more than pig-troughs, with one end knocked out. The "boat" is built, like the flume, V-shaped, and fits into the flume. It is composed of three pieces of wood—two two-inch planks 16 feet long, and an end-board which is nailed about 2½ feet across the top.

The forward end of the boat was left open, the rear end closed with a board—against which was to come the current of water to propel us. Two narrow boards were placed in the boat for seats and everything was made ready. Mr. Fair and myself were to go in the first boat and Mr. Flood and Mr. Hereford in the other.

Mr. Fair thought we had better take a third man with us who knew something about the flume. There were probably 50 men from the mill standing in the vicinity waiting to see us off, and when it was proposed to take a third man the question was asked of them if anybody was willing to go.

Only one man—a red-faced carpenter, who takes more kindly to whisky than his bench—volunteered to go. Finally, everything was arranged. Two or three stout men held the boat over the flume and told us to jump into it the minute it touched the water and to "hang on to our hats."

The signal of "all ready" was given, the boat was launched and we jumped into it as best we could, which was not very well, and away we went like the wind.

One man who helped to launch the boat fell into it just as the water struck it; but he scampered out on the trestle, and whether he was hurt or not we could not wait to see.

The grade of the flume at the mill is very heavy and the water rushes through it at railroad speed. The terrors of that ride can never be blotted from the memory of one of that party. To ride upon the cow-catcher of an engine down a steep grade is simply exhilarating, for you know there is a wide track regularly laid upon a firm foundation, that there are wheels grooved and fitted to the track, that there are trusty men at the brakes and, better than all, you know that the power that impels the train can be rendered powerless in an instant by the driver's light touch upon his lever. But a flume has no element of safety. In the first place, the grade cannot be regulated as it can on a railroad; you cannot go fast or slow at pleasure; you are wholly at the mercy of the water. You cannot stop; you cannot lessen your speed; you have nothing to hold to; you have only to sit still, shut your eyes, say your prayers, take all the water that comes—filling your boat, wetting your feet, drenching you like a plunge through the surf—and wait for eternity. It is all there is to hope for after you are launched in a flume-boat. I cannot give the reader a better idea of a flume ride than to compare it to riding down an old-fashioned eave-trough at an angle of 45°, hanging in mid-air without support of roof or house, and thus shot a distance of 15 miles.

At the start, we went at the rate of about 20 miles an hour, which is a little less than the average speed of a railroad train. The reader can have no idea of the speed we made until he compares it to a railroad. The average time we made was 30 miles per hour—a mile in two minutes for the entire distance. This is greater than the average running time of railroads.

The red-faced carpenter sat in front of our boat on the bottom as best he could. Mr. Fair sat on a seat behind him and I sat behind Mr. Fair in the stern and was of great service to him in keeping the water, which broke over the end-board, from his back.

There was a great deal of water also shipped in the bows of the hog-trough, and I know Mr. Fair's broad shoulders kept me from many a wetting in that memorable trip.

At the heaviest grade the water came in so furiously in front that it was impossible to see where we were going or what was ahead of us; but when the grade was light and we were going at a three or four-minute pace, the vision was very delightful, although it was terrible.

In this ride, which fails me to describe, I was perched up in a boat no wider than a chair, sometimes 20 feet high in the air, and with the ever-varying altitude of the flume, often 70 feet high. When the water would enable me to look ahead, I would see this trestle here and there for miles, so small and narrow and apparently so fragile, that I could only compare it to a chalk-mark upon

which, high in the air, I was running at a rate unknown upon railroads.

One circumstance during the trip did more to show me the terrible rapidity with which we dashed through the flume, than anything else. We had been rushing down at a pretty lively rate of speed when the boat suddenly struck something in the bow—a nail, or lodged stick of wood, which ought not to have been there. What was the result? The red-faced carpenter was sent whirling into the flume, ten feet ahead; Fair was precipitated on his face and I found a soft lodgment on Fair's back.

It seemed to me that in a second's time Fair, himself a powerful man, had the carpenter by the scruff of the neck and had pulled him into the boat. I did not know that, at this time, Fair had his fingers crushed between the boat and the flume.

But we sped along; minutes seemed hours. It seemed an hour before we arrived at the worst place in the flume, and yet Hereford tells me it was less than ten minutes. The flume at the point alluded to must have been very near 45° inclination.

In looking out before we reached it, I thought the only way to get to the bottom was to fall. How our boat kept in the track is more than I know. The wind, the steamboat, the railroad never went so fast. I have been where the wind blew at the rate of 80 miles an hour and yet my breath was not taken away. In the flume, in the bad places, it seemed as if I would suffocate.

The first bad place that we reached—and if I remember right, it was the worst—I got close against Fair. I did not know that I would survive the journey, but I wanted to see how fast we were going. So I lay close to him and placed my head between his shoulders. The water was coming into his face like the breakers of the ocean. When we went slow, the breakers came in on my back; but when the heavy grades were reached, the breakers were in front. In one case Fair shielded me and in the other I shielded Fair.

In this particularly bad place I allude to, my desire was to form some judgment of the speed we were making. If the truth must be spoken, I was really scared almost out of reason; but if I was on the way to eternity, I wanted to know exactly how fast I went; so I huddled close to Fair and turned my eyes toward the hills. Every object I placed my eye on was gone before I could clearly see what it was. Mountains passed like visions and shadows. It was with difficulty that I could get my breath. I felt that I did not weigh an hundred pounds, although I knew, in the sharpness of intellect which one has at such a moment, that the scales turned at *two hundred*.

Mr. Flood and Mr. Hereford, although they started several minutes later than we, were close upon us. They were not so heavily loaded and they had the full sweep of the water, while we had it rather at second-hand. Their boat finally struck ours with a terrible crash.

Mr. Flood was thrown upon his face and the waters flowed over him, leaving not a dry thread upon him. What became of Hereford I do not know, except that when he reached the terminus of the flume, he was as wet as any of us.

This only remains to be said. We made the entire distance in less time than a railroad train would ordinarily make, and a portion of the time we went faster than a railroad train ever went.

Fair said we went at least a mile a minute. Flood said we went at the rate of 100 miles an hour, and *my* deliberate belief is that we went at a rate that annihilated time and space. We were a wet lot when we reached the terminus of the flume. Flood said he would not make the trip again for the whole Consolidated Virginia Mine.

Fair said that he should never again place himself on an equality with timber and wood, and Hereford said he was sorry that he ever built the flume. As for myself, I told the millionaire that I had accepted my last challenge. When we left our boats we were more dead than alive.

We had yet 16 miles to drive to Virginia City. How we reached home the reader will never know. I asked Flood what I was to do with my spoiled suit of English clothes. He bade me "good night," with the remark that my clothes were good enough to give away. The next day, neither Flood nor Fair were able to leave their bed. For myself, I had only strength enough left to say, "I have had enough of flumes."

A NEWSPAPER'S STORY.

One day, about three in the afternoon, a middle-aged gentleman ran up the steps of a handsome house, in a handsomer city street, and asked the servant who opened the door if Miss Neville was at home. Being answered in the affirmative, he sent in his card. Written upon it was the name —William Belmore.

The servant, having shown him into the front parlor, took the card upstairs and returned with the information that Miss Neville would be "down in a moment," and in a moment Miss Neville herself entered. She was a beautiful young woman of three-and-twenty. She was dressed stylishly and bore herself with an air that showed she was used to society.

She held in her hand a newspaper, around which was folded a wrapper, directed to herself, which she had taken from the hall table as she passed. She had only glanced at the direction and as yet not opened it. That paper was myself—I had just arrived from Washington.

At her entrance Mr. Belmore arose and advanced, holding out his hand. She gave him hers, which he certainly kept a moment or so longer than was necessary. He was a tall, well-built man enough, fifty years of age, with gray side whiskers and a high nose.

Of course as a newspaper and one devoted to fashionable intelligence, I have great experience in love affairs. I saw at a glance that Mr. Belmore was in love with Miss Neville and that he intended to offer her his hand and heart at some time. After they had conversed awhile, I knew that he had resolved to do it that very day. She knew it too, when he had remarked:

"My dear Miss Neville, I have something very particular to say to you."

He began by telling her that she was beautiful. Then he told her that he loved her. Then he mentioned the amount of his property and real estate and asked her if she would marry him.

She thanked him in a very well arranged speech, at the end of which she declined his offer.

When she had done this there was a silence. Mr. Belmore broke it by making an inquiry:

"Would she ever change her mind? Might he not hope that, having thought his offer over, she would view it in a better light?"

She replied that it was not a question of time and that she certainly should not change her mind. She hoped, however, that he would always be her friend.

At that he grew very angry, though he tried not to appear so; and in a moment he arose to go.

She bowed him to the parlor door and he went out into the hall, into the vestibule, and to the front door. There a new lock, which was the torment of every stranger, baffled him. He stood a prisoner between the two doors, vainly struggling to open either of them for five minutes.

In this space of time Miss Neville had seated herself in a great arm-chair and taken me out of my wrapper. As soon as she did so her eye rested on a paragraph, on each side of which were placed two pencil brackets.

There were not fifty words between them; but as she read I felt myself begin to tremble in her hands.

"Is it possible?" she cried; and tears arose to her eyes; and just then a faint sound in the hall attracted her attention.

Mr. Belmore had managed to open the inner door and stood at that of the parlor.

"I beg a thousand pardons, Miss Neville," he said, "but I cannot manage to—to get out of the house as rapidly as, doubtless, would be agreeable to you."

He was very angry at this time and the marks of two red hot tears of rage and grief—middle-aged tears—were on his cheeks. I don't know whether she saw them, but he noticed those in hers and the change in her face.

"I regret that I should have distressed you," he said, "I—I—I hoped to make you as happy as a different answer would have made me."

As he spoke she put me down upon the table and advanced to him.

h" Would a different answer have made you appy?" said she.

"That I asked the question is sufficient proof of that," said he.

"Then be happy," said she, and held out her hand.

I never saw so happy a man since I was a newspaper.

He took her hands and put them to his lips.

"If it had not been for the door-lock, my dear," he said, "how miserable I should be this moment!" Bless the door-lock! The angels must have been watching over me when I grew so stupid over it—eh, darling?"

"I am glad you came back," said she.

"And don't cry. It's all over. I did not go away," said he.

"Just let me cry a little while," said she.

"What has happened to-day will never happen again, you know. It is only for once."

"Yes, it's not likely to be done over again," said he. "And to think I might have gone off. They always told me that ladies said 'no' when they meant 'yes;' but I did not believe it until to-day."

And after a while he took his leave, well satisfied.

They are married now, and he often spoke of that day. He says that but for the door-lock he might have been a miserable bachelor, for he should never have asked her a second time for what she had once refused. She always smiles on him when he says that. All the world knows the story of the door-lock and how she changed her mind while he was opening it, and it is quite amusing and romantic; but no one knows about me. I am quite an old paper now, for I bear date 1872. I lie in a little box in which is a photograph, four letters and a ring. The box is always locked but the pencilled brackets have not faded out yet, and between them lie these words:

"One of the most elegant weddings of the season took place yesterday at St. ——'s Church, where Captain Leslie Rawden was united in the holy bonds of matrimony to the young and beautiful society belle, Miss Eva La Croix, the heiress of one of our wealthy merchants, Mr. C. La Croix. The happy pair have started on a tour to Europe."

The letters on the inside of the ring are, "L. R. to A. N."

Women do change their minds very unexpectedly, but I don't think that it was the patent lock that was the cause of Mr. Belmore's happiness, and I'm a newspaper of great experience.

The Literary World.

RECENT LITERATURE.

The Farmer's Veterinary Adviser; A Guide to the Prevention and Treatment of Diseases in Domestic Animals. By James Law, Professor of Veterinary Science in Cornell University, Etc., Etc. [Illustrated; pp. 426.] Ithaca, N. Y.: published by the Author.

Every man who has the care of animals requires some safe adviser in case of accident or disease making its appearance among them. Scientific or thoroughly educated veterinarians are comparatively few in this country and the farmer, with rare exceptions, must depend upon his own or neighbor's skill and knowledge of the treatment required in such cases; consequently, any aid which can be derived from books is generally acceptable, and this we believe, is the place the work before us is designed to fill. After a careful examination of it we are satisfied that it is worthy of the highest commendation and a book that no farmer can afford to do without. We notice with pleasure that the author has avoided the use of purely scientific and unfamiliar terms wherever it could be done without in any way making himself less clearly understood by the reader. The work is also quite opportune, for diseases of domestic animals have increased of late years or old ones assumed new forms, thereby leaving our old authors far in the background and their works of little value as advisers. Prof. Law's work ought to find its way into every farmer's library and that too, right speedily, not only as a profitable investment but to prevent cruel treatment as practiced by many owners of stock.

History of the Intellectual Development of Europe. By John William Draper. Revised Edition. [2 vols.—12 mo.; $3.] New York: Harper Bros.

In his treatise on "Human Physiology" (one of the best works of the kind ever written) Dr. Draper wrote of man as an individual. In this work—which may be properly considered as a continuation of the other—he treats of man as related to society, of which he forms a part.

In considering the growth of intelligence, it is argued that nations and individuals, as well as all physical things, are governed by law; that physical agencies control all organisms, not excepting man; that social advancement is as completely subject to natural law as is bodily growth, and that, like men, it has its succeeding stages from infancy to old age, passing also through ages of credulity, inquiry, faith, reason and decrepitude, and that the members of communities, like those of families, are usually found in different stages of progress.

There are few authors who combine so well as does Dr. Draper the power of accumulating facts with the faculty of presenting them so fully and clearly. He arranges his topics with such relations to each other as to lead the reader easily from step to step in his argument, and elucidates the truth of his philosophy in language so concise and style so simple as to be readily comprehended.

The favor with which the work has been received in Europe may be judged from the fact that the first edition was translated into French, German, Russian, Polish, Servian, &c.

How to Get Rich in California. A Compilation. [Paper—pp. 137. Price 50c.] Philadelphia: McMorris & Gans.

California is an attractive subject. It has, in fact, attracted a great many subjects who have asked the question this book essays to answer. The common experience has been that very hard work in allopathic quantities was about the surest way to accomplish the object. The book under notice is crammed with statistics and matter that addresses itself directly to the practical man. El Dorado is a shifting phrase, and the gold mines that attracted the Argonauts of '49 have been variously modified, until a sheep ranch, a vineyard, agriculture and, in the case of "John," family washing have proved to be real sources of wealth, which are not so fleeting and uncertain as "prospecting." Those intending to cast their lot on the Pacific Slope will find this book serviceable.

Bachelder's Popular Resorts and How to Reach Them. By J. B. Bachelder. [Illustrated. Paper—pp. 389. Price, 75c.] New York: Geo. R. Lockwood.

Mr. Bachelder is again in the field with his popular book, as profusely illustrated as ever, and so replete with good advice that we are tempted to believe that the Persian proverb is all wrong. It says Heaven sent ten bushels of talk to earth, nine of which were given to women. The compiler must hold a lien on those nine bushels. The talk is practical and cannot fail to be of service to those who contemplate folding their tents and taking an outing. We wish we were among the number.

The Galaxy for September will contain a biographical sketch of General Custer, written by Captain Frederick Whittaker of the cavalry service; also a continuation of General Custer's "War Memoirs." The publishers of the Galaxy received copy from General Custer just before his death, and his "War Memoirs" will be continued in several numbers of the Galaxy. Ex-Secretary Wells will also contribute articles in the next two numbers of the Galaxy on "The Nomination and Election of Abraham Lincoln." Also articles by Richard Grant White, Albert Rhodes and J. H. Siddons, together with several interesting short stories and poems.

BOOKS RECEIVED.

From J. W. Schermermorn & Co., New York:
- Elements of English Grammar. By S. W. Whitney, A. M. (Cloth.—pp. 160.) Elements of Latin Grammar. By G. Fischer, LL. D. [Cloth.—pp. 236.] Price $1.25. The Mask of Comus. By Jno. Milton; edited by H. B. Sprague, A. M., Ph. D. Schermerhorn's Monthly for August.

Lee & Shepard, Boston, Mass.:
- The Chinese Problem. By L. T. Townsend, D. D. (Paper.—pp. 86.) Price 50 cents.

State Printing Office, Sacramento, Cal.:
- Chinese Immigration: Testimony taken before a Committee of the Senate of the State of California. (Paper.—pp. 173.)

- Galaxy, Harper's, Scribner's, St. Nicholas, Atlantic Monthly, Wallace's Monthly.

Sabbath Reading.

O HEAD, SO FULL OF BRUISES.

O head, so full of bruises!
Brow, that its life-blood loses!
O great humility!
Across his face are flying
The shadows of the dying:
'Twas suffered all for me!

O back, by scourges plowed!
O soul, by sorrow bowed
Upon the accursed tree!
He hears the bitter scorning:
'Tis night, without a dawning:
'Twas suffered all for me!

Eye, that in darkness sinketh!
Lip, that the red cup drinketh!
Hands, bound to misery!
See, from his feet forth streameth
The fountain that redeemeth!
'Twas suffered all for me!

And now he speaks: oh hearken,
While clouds all nature darken!
"Lama Sabacthani!"
His head is bent, and droopeth,
To such a death he stoopeth!
'Twas suffered all for me!

DEITY IN FORTY-EIGHT LANGUAGES.

The following list, comprising the name of God in forty-eight languages, was compiled by the well-known French physiologist, Louis Burger, in the following manner—One day, as he was walking along the streets of Paris, he heard a voice beseeching him to buy some nuts. Upon looking back he discovered that it was the voice of his old barber, who was gaining a scanty living by selling nuts on the street. To aid him, he hastily made out and gave to the barber the following list:

Hebrew—Elohim, Eloah.
Chaldaic—Ellah.
Assyrian—Eleah.
Syriac and Turkish—Alah.
Malay—Alla.
Arabic—Allah.
Language of the Magi—Orsi.
Old Egyptian—Tuet.
Armorian—Teuti.
Modern Egyptian—Teun.
Greek—Theos.
Cretan—Thios.
Æolian and Doric—Ilos.
Latin—Deus.
Low Latin—Diex.
Celtic and Gallic—Dia.
French—Dieu.
Spanish—Dios.
Portuguese—Deos.
Old German—Diet.
Provencal—Diou.
Low Breton—Done.
Italian—Dio.
Irish—Dia.
Olalu Tongue—Deu.
German and Swiss—Gott.
Flemish—Goed.
Dutch—Godt.
English and Old Saxon—God.
Teutonic—Goth.
Danish and Swedish—Gut.
Norwegian—Gud.
Sclave—Buch.
Polish—Bog.
Pollaeca—Bung.
Lapp—Jubinal.
Finnish—Jumala.
Runic—As.
Zemblain—Fetizo.
Pannonian—Istu.
Hindostance—Rain.
Caromandel—Brama.
Tartar—Magatal.
Persian—Sire.
Chinese—Pru sa.
Japanese—Goesur.
Madagascar—Zamar.
Peruvian—Puchecammac.

By the sale of these lists the barber was enabled to make as good a living, if not better, than M. Burger himself.

THOUGHTS FOR THINKERS.

One may be sincere without being safe.

Forbidden pleasures, though loved at first, are loathed at last.

To be blessed with happiness we must be beautified with holiness.

He that would commune much with God must commune little with the world.

Resignation is putting God between one's-self and one's grief.—*Madame Swetchine.*

None can enter by the heavenly gate above who do not enter by the narrow gate below.

Though we must never be weary of the Lord's work, the sooner we weary of Satan's the better.

In this simple fact, that we cannot accurately foresee the future, lies a refuge from despair.—*Lewes.*

The thing which an active mind most needs is a purpose and direction worthy of its activity.—*Bovee.*

That which makes death so dreadful is the consciousness of sin and the fear of damnation.—*Heubner.*

There will not be a tear in heaven—there will not be a smile in hell; there will be no weeping in the former, and nothing but weeping in the latter.

Ladies' Portfolio.

ARRIERE PENSEE.

He wraps me round with his riches,
He covers me up with his care,
And his love is the love of a manhood
Whose life is a living prayer.
I have plighted my woman's affections,
I have given my all in all,
And the flowers of a daily contentment
Renew their lives ere they fall.
And yet like an instrument precious
That playeth an olden tune,
My heart in the midst of its blessings
Goes back to a day in June—
To a day when beneath the branches
I stood by a silent stream,
And saw in its bosom an image,
As one seeth a face in a dream.

I would not resign his devotion,
No, not for a heart that lives,
Nor change one jot of my condition
For the change that condition gives:
I should mourn not more another,
Nor more for another rejoice,
Than now when I weep at his absence,
Or welcome his step and his voice.
And yet, like an instrument precious,
That playeth an olden tune,
My heart in the midst of its blessings
Goes back to a day in June—
To a day when beneath the branches
I stood in the shadowy light,
And heard the low words of a whisper
As one heareth a voice in the night.

THE CHOICE OF A WIFE.

Next to choosing the Lord Jesus Christ as his Saviour and guide, the most important choice a young man can make is that of a *wife*. Yet this most eventful step is too often regarded from first to last in the most trivial aspect. With many it is the merest matter of fancy or boyish caprice. Sometimes a wife is sought for the sole gratification of carnal desires. Sometimes marriage is viewed entirely as a shrewd pecuniary speculation. Indolent, extravagant young men sometimes intrigue through a marriage-vow for a wealth they are too lazy or too thriftless to earn by honest toil.

On the other hand, many an ambitious parent has sought to purchase a splendid "establishment" with the sweetest charms that heaven has bestowed upon a daughter. What baser bargain can be consummated than when a woman consents to sell her person without her heart to a rich suitor? Only one man should be rich enough to win my daughter: it is he who can offer a love without a rival, and a character without a stain. True religion, common-sense, industrious habits and a warm heart—when a young man can offer *these*, no daughter who is worthy of such a prize will be likely to "say him *nay*."

With what a rash recklessness do millions rush into momentous engagements that yield the inevitable retribution of domestic misery! How few seek by prayer for Divine guidance when choosing the companion of their heart, their home, their destiny! Far oftener is it passion than prayer that controls this great decision. The gratification of a fancy, the excitement of a courtship, and the frolic of a wedding, are frequently the only preparations for the serious realities of a wedded life.

Boyish caprice and girlish romance look vastly different in human eyes when they have crystallized down into the permanent forms of daily existence under the same roof, at the same table and fireside, year in and year out, for summer and winter, for sickness or health, for better or worse, clear on to the doorway of the tomb. When the novelty of wedded life has worn away, and perhaps the beauty of the fair face that inspired the early passion has faded, then there must be something *solid* left behind, or marriage is a mockery, and its coveted happiness but a dream. There must be mutual confidence, mutual respect, unity of aim and old-fashioned love: there ought to be also a union of hearts in the love of Christ, in closet devotions and at the communion-table. (1. Cor. vii. 39; 2. Cor. vi. 14.)

When those are the qualities of a nuptial union, it is a marriage "*in the Lord*." It "shineth more and more" from the auroral dawn of first love "unto the perfect day" of rich and ripened bliss. When young hearts are wedded in Christ they are wedded for heaven. It is a delightful act for a Christian minister to join such hearts and hands together; but the words sometimes stick in his throat when he attempts to pronounce a benediction on a marriage which neither common-sense nor conscience have had a share in bringing about. His *fee* seems to come out of Judas' bag.

The admirable Philip Henry sought the hand of an only daughter in a somewhat prominent family. Her father said to her, "This young man seems to be an excellent preacher, but I do not know whence he came."

"True," replied the daughter; "but I know *where he is going*, and I want to go along with him." The marriage proved eminently happy, and one of the children was the famous commentator.

When his own son Matthew and his daughters asked his consent to their marriage, he said, "Please God, and please yourselves, and then you will be sure to please me."

At their weddings he saluted them with a fatherly kiss, and said, "Other people wish you much happiness, but I wish you much *holiness*: if you have that, you are certain to be happy."

No two steps in a man's life are so solemn as those which join him to Christ's church and join him to a wife.

Marriage is an ordinance of God. It has often proved a "saving ordinance" to others who had no other tie to Christianity. The men whom a wise marriage has saved (with God's blessing) are innumerable. The men whom reckless, wretched marriages have ruined,—are their histories not written in the "Book of the Chronicles" of prayerless homes and impenitent death-beds?

Happy are those who, like Aquila and Priscilla, are united in the Lord! Happy are they who walk the life-journey, all the safer and all the happier for walking it hand in hand, keeping step to the voice of duty and of God. Wedded in time, they are wedded for heaven, and will sit down together with exquisite rapture at the Marriage Supper of the Lamb.—*T. L. Cuyler, D. D.*

AN ANTI-SLANG SOCIETY.

The "Reform Club" is the title of a new organization in the West End, organized by young ladies for the purpose of discouraging the use of "slang phrases" in conversation. At a recent meeting, while a member was addressing the society, she inadvertantly made use of the expression "awful nice," and was called to order by a sister member for transgressing the rules.

"In what way have I transgressed?" asked the speaker, blushing deeply.

"You said it would be 'awful nice' to admit young gentlemen to our deliberations," replied the other.

"Well, wouldn't it be?" returned the speaker; "you know you said yourself no longer ago than yesterday that—"

"Yes, I know; but you said 'awful nice.' That's slang."

"Well," said the speaker, tartly, "if you are going to be so awful nice about it, perhaps it is; but I wouldn't say anything if I were you. Didn't you tell Sallie Spriggins, this morning, to pull down her basque?"

"No, I didn't," retorted the other, her face growing crimson; "and Sallie Spriggins will say I didn't. She won't go back on me."

"This is a nice racket you are giving us," cried the President, after rapping both speakers to order. "Let us ask, what is the object of this society?"

"To discourage slang!" cried a dozen voices.

"Kerect," said the President, "go on with the funeral."

A member rose to explain that she had been fined at the last meeting for saying "awful nice" herself, but she hadn't the stamps to pay it now—would settle, however, in the sweet by-and-by.

"That'll be all right," said the President; "pay when you have the ducats."

Another member asked if a young lady could say "old splendid" without subjecting herself to a fine.

"You bet she can't," said the President, who was the original founder of the society, and therefore appealed to when any nice question was to be decided.

"Then," said the speaker, "I move that Miranda Pew come down with the dust, for I heard her say that her beau was just old splendid."

Miranda's face was in a blaze as she cried, "Well, if my beau was such an old hair pin as your fellow is I wouldn't say it."

"Shoot the chinning," cried the President; "will you never fumble?"

But the confusion was too great to be allayed. Miranda's blood was up; some sided with her and others against her, and amid the Babel that followed could be heard such exclamations as "dry up," "nice blackberry you are," "wipe off your chin," "hire a hall," etc., when a motion to adjourn was carried "by a large majority."—*Wheeling Times.*

FOR AND ABOUT WOMEN.

Poets know, and statesmen ought to know, it is by sentiment when well directed—as by sorrow when well used—great nations live. When sentiment dies out, and mere prosaic calculation or loss and profit takes its place, then comes a Byzantine epoch, a Chinese epoch, decrepitude and slow decay.—*Kingsley.*

The every-day cares and duties which men call drudgery are the weights and counterpoises of the clock of time, giving its pendulum a true vibration, and its hands a regular motion, and when they cease to hang upon the wheels, the pendulum no longer swings, the hands no longer move, the clock stands still.—*Longfellow.*

They had company to tea. The table was set out splendidly. The biscuit were as white and light and flaky as snow, and the cake was just lovely. The company were delighted with everything, and were enjoying themselves hugely and getting the *modus operandi* of making the biscuit, which were too lovely for anything, when the infant of the household unfortunately whispered, "Ma, why don't you have such a tea when there ain't company?"

A Detroiter of liberal education, says the Free Press, has been greatly annoyed because his wife and other women are not better posted on history and other matters connected with the growth or welfare of the country. The other day he carried home a big history, and handed it to his spouse with the remark, "There, Mary, I want you to commence at page 1, and see if you can't learn something." She agreed to become his pupil, and when he come home to supper he found her reading away, hair down, slippers on, all the fires out but one, and no sign of supper. "Why, how's this?" he inquired. "Are you sick?" "Sick! No." "Well, where's my supper?" "I don't know anything about your supper," she replied, as she settled back in her chair, "but I can tel you about the first discovery of Florida."

Reading for the Young.

LETTING THE OLD CAT DIE.

Not long ago, I wandered near
A play-ground in the wood,
And there heard words from a youngster's lips
That I've never quite understood.

"Now let the old cat die," he laughed.
I saw him give a push,
Then gayly scamper away as he spied
My face peep over the bush.

But what he pushed, or where he went,
I could not well make out,
On account of the thicket of bending boughs
That bordered the place about.

"The little villain has stoned a cat,
Or hung it upon a limb,
And left it to die all alone," I said;
"But I'll play the mischief with him."

I forced my way between the boughs,
The poor old cat to seek,
And what did I find but a swinging child,
With her bright hair brushing her cheek.

Her bright hair floated to and fro,
Her little red dress flushed by,
But the loveliest thing of all, I thought,
Was the gleam of her laughing eye.

Swinging and swaying back and forth,
With the rose-light in her face,
She seemed like a bird and a flower in one,
And the forest her native place.

"Steady! I'll send you up, my child,"
But she stopped me with a cry;
"Go 'way! go 'way! Don't touch me, please—
I'm letting the old cat die!"

"You letting him die!" I cried, aghast—
"Why, where's the cat, my dear?"
And lo! the laughter that filled the woods
Was a thing for the birds to hear.

"Why, don't you know," said the little maid,
The flitting, beautiful elf;
"That we call it 'letting the old cat die,'
When the swing stops all of itself?"

Then swinging and swinging, and looking back,
With the merriest look in her eye,
She bade me "good-day," and I left her alone,
A-letting the old cat die.

WHICH WAS THE BRAVE BOY?

BY LILLIE E. BARR.

"Our cow has got a new calf."

This statement was made by a small boy who had been sitting on the fence nearly five minutes, looking very hard at his neighbor's little boy, who was busy digging in the garden.

"What's it like?" asked the neighbor's boy, dropping the spade, in order to ask the question from the vantage ground of hands in his pockets.

"Oh, it's red, with some white into it."

"We've got a new baby," answered the other, rather proudly.

"Oh, babies aren't half as nice as calves; besides we've got a baby too, only she's grow'd a little big."

"But our baby ain't a 'she;' it's a *he*," said the boy, decisively.

"Oh!"—and the tone implied that the circumstance of sex might make up for the inferiority of babies to calves, in point of interest.

"What's your name?" said the little digger, lifting his spade in order to lean upon it after the fashion of men; mine is Francis Judson, but they call me Frankie."

"Mine is Thomas Black; mother calls me Tom, but the fellows call me Black. I wear suspenders; do you?"

"No," said Frankie,—feeling very much as if it was a mean kind of thing not to have arrived at that dignity—"but mother says she is going to get me a pair, right away."

"How old are you? I'm twelve, going on thirteen."

"I'm ten, very near indeed.

"Oh!—have you got a fishing line?"

"Yes," answered Frankie, feeling his spirits rising in the pride of this acquisition, and almost forgetting the default of the suspenders; "I've got a bully line."

"Will your mother let you go a-fishing?" asked Tom.

"I'll go and ask her if you'll wait," said little Frankie; and in a few minutes he returned with her permission. The two boys set off for the river and were soon the very best of friends; for Frankie looked up to Tom, who was a boy "going on thirteen" and wearing suspenders. Besides Tom had volunteered the information that he "was very brave, and afraid of nothing, or no one, not even the district schoolmaster." Indeed, the impression left on Frankie's mind by a relation of Tom's school-room experiences was, that the schoolmaster was rather afraid of Tom. But then Frankie was a quiet little fellow, playing a good deal with girls, and, as Tom rather scornfully declared, "quite tied to his mother's apron strings."

Frankie readily allowed the general superiority of Tom; and indeed felt, after listening an hour to Tom's adventures, that Tom Black, in point of pluck, was little inferior to Jack the Giant-killer. Towards sunset the boys strung their fish and rose to go home, Tom being quite amused at Frankie's fear of a lizard which he suddenly came upon. He admitted that he believed "the creatures were quite as poisonous as snakes, but he'd got quite used to them;" and then he told one or two of his adventures in which lizards of extraordinary size figured.

In the middle of one of these stories he stopped suddenly short, and stood looking up the lane with terror-stricken eyes; for coming at full speed down it was a large dog with his tongue lolling out, and every sign about him of ungovernable agony or passion.

Oh, Frankie, run! That's Gibson's Ponto, and he's got the hydrophobia. I heard father say so this morning; and O dear! there's little Trotty Attwood just behind us. Come on, Frankie, or you'll get bit,"—and without a moment's delay Tom bounded over the fence and fled across the field.

But Frankie looked first at the dog running so swiftly towards him, and then at little Trotty who, all unconscious of danger, was coming slowly with careful steps up the lane, carrying a pitcher half full of new milk in her two little sun-browned hands. In another moment he had reached the child, and before she could speak had fairly thrown her over the fence. He had barely time to leap to the other side himself when old Ponto fell down in a fit almost on the spot where he had stood with the child a minute before.

"You've spilt all my milk and broked my nice pitcher, and you're a weal bad, wicked boy, Frankie Judson," said little Trotty, picking herself up, and looking with no small indignation at poor Frankie, who sat pale and trembling on the grass.

"Never mind, Trotty; I've saved you from a mad dog, I have. Come, let me take you home quick;" and Frankie, springing to his feet, ran with the child in his arms as fast as his trembling legs would carry him to Mrs. Attwood's.

Mrs. Attwood's look and kiss quite repaid Frankie; yet he was very happy when his father patted him on the head, and his mother, with happy tears in her eyes, called him her "brave little lad." Yet even with these commendations added to his own satisfaction, he was not indifferent to the fact that Thomas Black, who was "going on thirteen" and wore suspenders, called him "a real plucky little boy," and introduced him as such to all "the fellows" who were the leaders of Boy Society in Thomsonville Center.

THE BOY, THE BEETLE AND THE DOG.

The minister gave out his text and droned along monotonously through an argument which was so prosy that many a head by-and-by began to nod, and yet it was an argument that dealt in limitless fire and brimstone, and thinned the predestinated elect down to a company so small as to be hardly worth the saving. Tom counted the pages of the sermon; after church he always knew how many pages there had been, but he seldom knew anything else about the discourse. However, this time he was really interested for a little while. The minister made a grand and moving picture of the assembling together of the world's hosts at the Millennium, when the lion and the lamb should lie down together and a little child should lead them. But the pathos, the lesson, the moral of the great lesson were lost upon the boy; he only thought of the conspicuousness of the principal character before the on-looking nations; his face lit up with the thought, and he said to himself he wished he could be that child, if it was a tame lion.

Now he lapsed into suffering again as the dry argument was resumed. Presently he bethought himself of a treasure he had, and got it out. It was a large black beetle with formidable jaws, a "pinch-bug" he called it. It was in a percussion-cap box. The first thing the beetle did was to take him by the finger. A natural flip followed, the beetle went floundering into the aisle, and lit on its back, and the hurt finger went into the boy's mouth. The beetle lay there working its helpless legs, unable to turn over. Tom eyed it, and longed for it, but it was safe out of his reach. Other people, uninterested in the sermon, found relief in the beetle, and they eyed it too.

Presently a vagrant poodle dog came idling along, sad at heart, lazy with the summer softness and the quiet, weary of captivity, sighing for change. He spied the beetle; the drooping tail lifted and wagged. He surveyed the prize; walked round it; smelt of it from a safe distance; walked round it again; grew bolder, and took a closer smell; then lifted his lip, and made a gingerly snatch at it, just missing it; made another and another; began to enjoy the diversion; subsided to his stomach with the beetle between his paws, and continued his experiments; grew weary at last, and then indifferent and absent-minded. His head nodded, and little by little his chin descended and touched the enemy, who seized it. There was a sharp yelp, a flirt of the poodle's head, and the beetle fell a couple of yards away, and lit on its back once more. The neighboring spectators shook with a gentle inward joy, several faces went behind fans and handkerchiefs, and Tom was entirely happy. The dog looked foolish, and probably felt so; but there was resentment in his heart, too, and a craving for revenge. So he went to the beetle and began a wary attack on it again; jumping at it from every point of a circle, fighting with his fore-paws within an inch of the creature, making even closer snatches at it with his teeth, and jerking his head till his ears flapped again. But he grew tired once more, after a while; tried to amuse himself with a fly, but found no relief; followed an ant around, with his nose close to the floor, and quickly wearied of that; yawned, sighed, forgot the beetle entirely, and sat down on it! Then there was a wild yelp of agony, and the poodle went sailing up the aisle; the yelps continued, and so did the dog; he crossed the house in front of the altar; he flew down the other aisle; he crossed before the doors; he clamored up the home stretch; his anguish grew with his progress, till presently he was a woolly comet, moving in its orbit with the gleam and speed of

light. At last the frantic sufferer sheered from its course and sprang into its master's lap; he flung it out of the window, and the voice of distress quickly thinned away and died in the distance. * * * Tom Sawyer went home quite cheerful, thinking to himself that there was some satisfaction about divine service when there was a bit of variety in it. He had but one marring thought; he was willing that the dog should play with his pinch-bug, but he did not think it was upright to carry it off.—*Mark Twain's "Tom Sawyer."*

LETTERS FROM BOYS AND GIRLS.

Robert to Ellen.

DEAR EDITOR:—It is some time since I wrote to the RURAL—not since Mr. MOORE resigned the editorial chair; so, with my best wishes to his successors, I will proceed to comply with ELLEN J. S.'s request and chat with old friends through the RURAL'S columns. Well, ELLEN, you say you are *only* a girl, and it strikes me you must be a sensible one, because you don't do as most of your sex delight in doing—place yourself above the boys either by merit or conceit, I don't know which; but I am your firm friend from this out, as the Irish say. As to YOUNG TOM, I think he ought to throw another "bomb" into camp that would startle the whole tribe that are battling against him. We had busy times in this section through seeding time; owing to the wet weather last fall, plowing was pretty much behind hand, and in the commencement of seeding we had a long wet spell too, so things had to be put in a hurry; but the appearance of the crops at this writing promises a bountiful harvest, at least to those that wrought their farms well; as to those that did not, I think they will not fare so well,—but I heard one of those that owe their poor crops to their bad management say, one time, "Sure, the LORD will provide."—ROBERT H. C., *Wellesley, Ont.*

From Cousin "Jim."

DEAR UNCLES AND COUSINS:—I have never written for a paper before, but since I read Uncle TRUE'S letter I have concluded I would try. I am a farmer's daughter, and live in the southern part of New York State. My father owns 140 acres of land, and keeps twenty-two cows and five horses. I am fourteen; weigh 114 pounds, and am four feet ten and a-half inches tall. I help my father out of doors a good deal in haying time. I can ride on the hay tedder, drive the pitchfork, and I have done almost all of the raking this summer, and last spring I rode on the roller a good deal. I have never learned to milk, or to harness a horse yet, but maybe I shall some time. My father's hired men call me JIM. I guess they call me so because I work out of doors so much. Hoping to merit your approbation, I will close.—COUSIN J.

From the Peninsula State.

DEAR RURAL:—As I have never been admitted to the circle of Cousins I cannot say "Dear Cousins," but hope soon to be able to. I will try and draw a portrait of myself. I am of medium hight, have dark hair and eyes, and am what the girls would call rather a good-looking fellow. Don't call me vain, for I am not a bit. I live in a handsome little city, about eighty miles from Detroit. There is a very fine school-house here. It is a handsome building, both inside and out, and a great many girls and boys from out of town attend school here. It seems to me that the Cousins are getting tired of writing, or has YOUNG TOM frightened them all away? Write again, TOM, and don't let the girls have the pleasure of thinking they have driven you off.—ROB ROY.

The Puzzler.

GEOGRAPHICAL ENIGMA.

I AM composed of 58 letters:

My 9, 2, 14, 46, 21, 23, 7, 56, 36, 12, 41, 21 is a city in Pennsylvania.
My 55, 18, 47, 47, 21, 56, 3 a city in New York.
My 5, 19, 4, 8, 30, 17 a lake in New York.
My 23, 31, 22, 6, 25, 48, 33 a village in New York.
My 15, 11, 21, 27, 10, 29 an island west of Long Island.
My 13, 45, 23, 26, 28, 22 a river in New York.
My 29, 32, 1, 20, 21, 16, 9, 42, 24, 14, 52, 32 one of the United States.
My 50, 44, 29, 27, 9, 34, 56, 14, 35, 52 a city in Vermont.
My 16, 49, 53, 43, 37, 39, 57, 21, 23 a lake in Maine.
My 58, 40, 7, 46, 38, 32, 52 an island belonging to New York.
My 4, 17, 54, 51, 2 a bay that indents Long Island.
My whole is a Bible text.

☞ Answer in two weeks. S. C.

NUMERICAL ENIGMA.

I AM composed of 16 letters:

My 3, 16, 10, 13, 2 is a large and bright constellation.
My 4, 9, 7, 8, 15 one of the mechanical powers.
My 11, 12, 3, 1, 6 part of a wheel.
My 11, 5, 13, 3, 12 a sail vessel.
My 14, 13, 7, 6, 2 was a deity for whom a day of the week was named.
My whole is a proverb.

☞ Answer in two weeks. ISOLA.

PUZZLER ANSWERS.—Aug. 10.

GEOGRAPHICAL ENIGMA.—"The effectual, fervent prayer of a righteous man availeth much."

NUMERICAL ENIGMA.—"Light gains make heavy purses."

PUBLISHER'S NOTICES.

TO SUBSCRIBERS AND AGENTS.

As we are now entering upon the second volume of the Twenty-seventh year of the RURAL NEW-YORKER, it would be well for the proprietors to say to subscribers and agents that a more prosperous time than the present has not been seen in this office for many a year.

Notwithstanding the cry of "hard times" which has been echoing through the land, the rural population seem to be able to take their paper. It may not be known to many of you that at the end of each year and half-year a newspaper changes a large number of its subscribers. Some old ones discontinue and their places are filled with new, so that while the list does not diminish in numbers, the changes frequently amount to many hundreds.

There were hundreds on our list whose subscriptions expired with the last number in June, and of these every one has *renewed* but *six*. This is something unprecedented in the annals of a newspaper office, and is the most flattering indication to the new management that their strenuous and laborious efforts to make a *good* paper are fully appreciated. With such encouragement as this, subscribers and agents may rest assured that nothing which time, labor and money can procure will hereafter be omitted to make the RURAL still better than it is.

The Literary Departments will be kept up to their standards of excellence and morality, while the Practical Departments will continue to be made up of the most straightforward common sense which can be obtained. In these matters the aim will not be to make them so scientific that they may not be readily understood by every one; but it will be our constant endeavor to publish that which is *absolutely correct*. Now, all that is needed is for each subscriber to get another and our list will at once be doubled.

News of the Week.

DEATH OF HON. HENRY S. RANDALL.

THE HON. HENRY S. RANDALL, LL. D., for many years editor of the Sheep Husbandry department of the RURAL NEW-YORKER, died at his late residence in Cortland Village, N. Y., on the 14th instant, in his sixty-sixth year. This announcement will pain many RURAL readers throughout the country, by whom the deceased was esteemed as a man of ability, honor and unswerving integrity. Dr. RANDALL has long been widely and favorably known as a public man and author, and especially as a writer and authority on the subject of Sheep Husbandry. He was born in Madison County in 1811; graduated at Union College at the age of nineteen, and was soon after admitted to the bar, but ere long ceased the practice of his profession for more congenial pursuits. During his notable career, Dr. RANDALL held various positions of honor and responsibility, the duties of which he discharged with signal ability and fidelity.

In 1843 he was appointed County Superintendent of Public Schools, an office he most worthily filled. He was elected Secretary of State in 1851 and held that office in 1852 and 1853. As Superintendent of Education was not then a separate office, the duties now performed by that official were discharged by Dr. RANDALL, who exhibited remarkable qualifications for the position. Taking a deep interest in the common schools, he initiated various measures which redounded to their great advantage. Indeed he was a life-long friend and advocate of universal education, and ever active for its promotion and elevation—as manifested by his introducing a bill for compulsory education while a member of the Legislature and other acts to enhance the rudimentary knowledge and sound intelligence of the people of the State and Country. The last political office held by deceased was that of Member of Assembly in 1871, to which he was elected in a district usually strongly opposed to the party he represented—showing his personal popularity and the esteem in which he was justly held by his fellow citizens.

Dr. RANDALL was in many respects a notable man, and has left the imprint of a noble, useful and well-spent life. But it is as an author, and mainly on practical subjects, that his work has been most valuable and enduring. His works on Sheep Husbandry long ago rendered him *the* authority on that subject. The first, "Sheep Husbandry in the South," was published in 1849, and soon became and long continued popular. His next was "Fine Wool Husbandry," an important contribution to Agricultural Literature. But his greatest and most popular rural work was "The Practical Shepherd," published at this office. This was brought out during the war, but had a rapid and large sale—the demand for it being so great that upwards of twenty thousand copies were sold as rapidly as they could be supplied. It is still a standard authority and in demand. Dr. RANDALL was a careful and scientific breeder of fine-wooled sheep, but so conscientious and unselfish that he would never mention the fact in his works or the RURAL in any manner which could be construed into an advertisement of his choice flock. His ability and popularity among breeders and flock-masters is attested by the fact that he was for many years, and from their organization, President of both the National and New York State Wool Growers' and Sheep Breeders' Associations. Indeed, no man in America, and probably none in the world, has done so much to enhance the interests of Sheep Husbandry as he whose decease is now most regretfully chronicled.

But Dr. RANDALL'S successful labors as an author were not confined to practical subjects. A ripe scholar and fond of literary, scientific and historical research, he achieved triumphs in other than practical fields. The great literary work of his life, and the one in which he took much pride, was the "Life of Thomas Jefferson," published by the APPLETONS in three volumes. This is the standard biography of JEFFERSON, and exhibits the ability, accuracy and painstaking care and research of its accomplished author, for whom it alone establishes an enviable literary reputation. He was also author of "First Principles of Popular Education," "Public Instruction," and other valuable treatises.

Dr. RANDALL possessed a personal magnetism, charm of manner and kindness of heart which secured the confidence and esteem of all who made his acquaintance. A contemporary truly says he "was in every sense a true gentleman, genial as he was courtly, with no foes but hosts of friends." Dr. RANDALL leaves a wife and three children—one son and two daughters. One of his daughters is the wife of Judge FOLLETT, and the other of Dr. MOSHER of Norwich, Chenango Co. The decease of such a man will not only be mourned by his family and a large circle of attached friends, but regretted throughout the country, for the loss is national.—D. D. T. M.

HOME NEWS PARAGRAPHS.

ORDERS have already been issued from the War Department to hasten the work of recruiting the 2,500 additional men for cavalry regiments under the bill which was passed on Tuesday last. The standard for recruits heretofore in existence, requiring that they should be 5 feet 5 inches high and weigh not more than 155 pounds, has been changed, and it is now provided that any can be accepted who are 5 feet 3 inches high and do not weigh more than 175 pounds. The principal recruiting stations are at New York, St. Louis, Boston, Chicago, Buffalo and Indianapolis. Branch offices will be opened in several Western cities to secure the required number as soon as possible. The recruits will be immediately equipped for service and sent forward to the regiments in convenient squads. It is expected by the authorities at the War Department that the entire number will be recruited in two or three weeks from this time.

Millions of grasshoppers are prospecting in the Black Hills.

Twenty-eight paintings have been lent to the Yale Art School for exhibition, and 36 casts from Grecian sculptures have been purchased abroad.

The Revenue districts have been changed and modified.

The President denies the truth of the report that Secretary Robeson before leaving for Rye Beach placed his resignation in the hands of the President.

The prospects are that the railroad war is soon to be ended by mutual agreement.

Judge Stone of Colorado, who was forcibly taken from the train near Boulder recently, was sent over the mountains to Golden City, and thence to Denver. He is uninjured, as the men only wanted him to keep him from holding court and qualifying a receiver for the Colorado Central Railway. The Governor of Colorado called out two companies of soldiers to enforce, if necessary, the order of the Court. A reward of $5,000 for the arrest and conviction of the kidnappers of Judge Stone has been offered.

Gov. Villagrana of Lower California telegraphs to the Mexican Consul in San Francisco, Cal., that there is a general uprising of the Indians along the Colorado River and in the adjoining country against the Mexicans. Governor Villagrana is en route to San Diego, Cal., to procure arms and munitions of war. He declares that the situation is critical.

A severe hail, rain and wind storm passed over Wayne Co., Pa., the other night, unroofing many houses, blowing down chimneys and fences, and badly damaging the corn and crops.

The Providence Tool Company is busy on a contract with the Turkish Government for 600,000 Peabody Martini rifles, and is turning out 666 finished rifles a day. The contract is now about half filled.

The St. Louis ghost, which has lately made all the old ladies in North Market street hide their heads in terror under the bedclothes, proves to be an old maid's cat suspended in mid-air by means of a dozen small balloons, and extremely vocal.

Much excitement prevails along the Delaware river, in regard to the violation of the fish laws by riparian owners, who insist in putting eel weirs in the river, thereby destroying thousands of young black bass every night. Several weirs have been removed surreptitiously, and it is threatened that if all are not removed by the owners, they will be removed in the same manner.

The Rev. Wm. A. Cornell, who lived at Freedom Plains, near Poughkeepsie, hanged himself in the woods near his residence, the 17th inst. He is supposed to have been temporarily insane. Mr. Cornell graduated at Brunswick College, and was a minister of the First Reformed Church.

The President has approved the sentence of the naval court-martial held at San Francisco, of which Rear-Admiral Rogers was President, and which sentenced Paymaster R. C. Spaulding to be dismissed the service. The charges were neglect of duty in allowing his clerk, Mr. Pinney, to control Government funds and convert them to his own use, and to issue orders and give receipts for property never received by the Government. Paymaster Spaulding, therefore, ceases to be an officer of the United States Navy.

Secretary Chandler has appointed the following gentlemen as the Commission to treat with the Sioux Indians, as provided for in the Indian appropriation bill passed by Congress at its last session: B. C. Bulls of Iowa, George W. Manypenny of Ohio, A. G. Boone of Colorado, Newton Edmunds of Dakota, Bishop H. B. Whipple of Minnesota, A. S. Gaylord of Michigan, Assistant Attorney-General of the Interior Department, S. D. Hinman, interpreter, and Charles M. Hendley of Washington, D. C. Mr. Gaylord will act as legal advisor to the Commission, and represent the Interior Department. The Commission will start at once, and will meet in Omaha on Monday, the 28th inst.

Little Dick Gamelia, whose dangerous acrobatic performances were stopped in this city by the Society for the Prevention of Cruelty to Children, is now at the Crystal Palace, London.

The priest at the Roman Catholich Church at Cambridgeport, Mass., forbade the use of fans during his services. His congregation disobeyed the order, and two men were ejected. A lawsuit is the result.

An old pop-corn pedlar named Emery, at Old Orchard, Me., was so much chagrined at losing his basket, through violating the camp ground rules, that he crawled under a locomotive, and put his neck on the rail close to the wheel, clinging so persistently that several men had hard work to get him out.

The Columbus (Miss.) Index believes that Tweed is living in that city.

The newspapers are full of reports of suicides in all parts of the country. Various causes may be assigned for this access of the self-destruction mania—among them the hard times, the scarcity of employment, and the extreme heat of the summer. Unfortunately, one such case in a locality usually produces another, while the newspapers keep up a succession of the melancholy reports.

Nevada has again been visited with the meteorologic phenomena of cloud-bursts. Heavy rains have prevailed all over Nevada, but the cloud-bursts, as two years ago, seem to have been confined to the eastern portion of the State. The recent calamity near Eureka has been the more destructive, and it is a little singular that the phenomenon should have occurred within a few minutes of the same time as that which, two years ago, on the same day of the month, caused such a destruction of property.

The following report is from H. E. E. R., Hosensack, Pa.:—During this summer we have had a very dry spell. Grain was middling good. Apples in abundance. Hay crops were very light; pasture is scarce and butter is advanced—at present 40c. at the station, express not paid to Philadelphia. The weather is yet very warm—some days from 83° to 93° in the shade. Corn looks a great deal poorer than last year.

The Thames crew and Scotch Rifle Team are on their way to the Centennial.

Six Fenians have escaped from Fremantle Prison, Australia, and have arrived in New York on the brig Catalpa. There is great rejoicing among the faithful.

Newport, R. I., has been the scene of several games of "Lacrosse," the Indian-Canadian game, which will doubtless become as popular as base ball in this country.

Mr. Michael C. Kerr, Speaker of the House, died at Rockbridge Alum Springs, Va., Aug. 19, after a lingering and painful illness. He was born at Titusville, Pa., March 15, 1827. When twenty-five years old he moved to New Albany, Ind., and from thence till the time of his death his life was an active and laborious one. He dies universally esteemed. Both friends and foes, politically, unite in honoring his memory with generous praise. That he dies a poor man is taken as good proof of his integrity, and no blemish sullies the record of his long political career.

FOREIGN NOTES.

THE Russian Telegraph Agency, in reply to speeches made in the English House of Commons lately, to the effect that Russia was stronger in 1853 that she is now says:—"The *Golos* shows that Russia, who, in 1853, had an army of 600,000 men, now has 1,340,000 as a peace armament, and 2,500,000 in time of war."

The appointment of Gen. Berthaut to be French Minister of War, vice Gen. de Cissy, is officially published. Gen. Berthaut, as general of a division of infantry, was one of the most capable officers in the army, and his selection confirms the principle of making the War Department non-political.

Dr. Mudney, an Austrian physician at the head of the sanitary service of the Servian armies, has addressed an appeal to the Austrian army surgeons, asking them in the name of humanity, to obtain leave of absence and come to his aid. He promises them rare opportunities for acquiring practical knowledge in their profession; as the present war, he says, for cruelties of every kind, stands unique in the history of wars.

When a dyer's wife in Leith, Scotland, recently entered the bedroom where three of her children—aged 14, 9 and 4—were sleeping, she was horrified to find their faces covered with blood and the bed-clothes bespattered. The children had been attacked during the night by a rat, which they had vainly endeavored to catch on the previous

evening. It had bitten the cheeks of the two little boys and more severely the forehead of a girl, who lost a large quantity of blood.

The most powerfully-armored ship afloat is the Thunderer, which met with such a terrible accident recently; but two gunboats have just been finished on the Tyne which will be fitted up by the Armstrong firm with machinery working a 38-ton gun. Compared with the Thunderer the gunboats, built for a foreign government, are diminutive; yet each little vessel will carry a gun capable of piercing the thickest armor now on the seas. The smallness of these martne wasps will be their greatest protection, and the steam power will be so applied that not only the gun but also the vessel, will be under the complete control of the artillerist.

The Scottish National Memorial to the late Prince Consort was unveiled in Edinburgh the 17th inst. Her Majesty the Queen performed the ceremony of inauguration. In the afternoon Her Majesty received an address, inclosed in a gold and silver casket, from the Magistrates and Council at Holyrood Palace.

The Pacific mail from Hong Kong, via Yokohama, brings Chinese advices to July 15.

Messrs. Grosvenor and Baber, Commissioners to Yunnau, arrived at Shanghai July 3, having been during their absence in constant communication with Sir T. Wade, the British Minister.

The departure of Mr. Wade from Peking, and the establishment of the British Legation at Shanghai greatly startled the Chinese authorities, who first made efforts to persuade him to return, and afterward proposed to send the Viceroy of Nanking to reopen negotiations with him. Wade is understood to have rejected all overtures, and to have announced that troops were already summoned from India, although a peaceful settlement appears to be desired by most of the intelligent Chinese leaders.

There is unusual activity in military preparations, and the army of Tientsin is concentrating.

A famine prevails in the northern provinces producing disastrous consequences. Thousands of deaths from starvation occur daily. Rice has been ordered from the south and from Formosa, and the Peking authorities have given 100,000 taels and 1,000,000 catties of rice for the relief of the destitute. Hamlin College contributes 1,000,000 piculs of rice, and Li Hung Chang, Viceroy of Chihli Province, also sends 1,000,000 piculs of rice. It is not believed, however, that any efforts can check the calamities this year. The first rain in nine months fell on July 2.

The British House of Commons fought so hard over the Education Bill on the 3d inst. that they did not suspend hostilities till it was broad daylight on the morning of the 4th. There were then 197 members present, the Speaker was tired to death and everybody looked seedy, when the House adjourned till 2 P. M. on the same day.

In the first six months of this year twenty-eight new operas were produced in Italy.

To guard against fire in Westminster Abbey there is an order forbidding the use of any lights but lanterns, and of any matches except those which strike on the box only.

A London law compels organ-grinders to cease playing whenever told to do so by a resident of the disturbed neighborhood.

The Rev. Arthur Watson, a Protestant clergyman at Killowen, near Kenmore, Ireland, has murdered his wife by shooting her, she being under the influence of drink when he shot her.

Dispatches from Gen. Tchernayeff to Prince Milan report that his army is perfectly reorganized and ready to assume the offensive. An extraordinary Cabinet Council was held recently, Prince Milan presiding, at which it was resolved to continue the war to the last extremity. The Prince of Montenegro, understanding that the Turks intended to invade Montenegro from Albania, has left his brother-in-law, Vukovich, in command of the troops in Herzegovina, and has marched with eight battalions into Montenegro, whence he will invade Albania, where the Catholics promise him support.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug. 19, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	78,575	Molasses	280
Whisky	2,293	Rice, bbls	8,160
Corn meal, bbls	1,000	Cut meats, pkgs	5,166
Corn meal, bags	700	Lard, pkgs	8,519
Wheat, bush	183,630	Tobacco, hhds	3,714
Corn, bush	415,000	do. pkgs	6,885
Oats, bush	142,450	Butter, pkgs	21,700
Rye, bush	1,273	Cheese, bxs	67,836
Malt, bush	14,250	Cotton, bales	6,904
Barley, bush	1,500	Rosin	10,723
Beans, bbls	7,300	Spts. turp., bbls	1,610
Grass seed, bush	1,386	Dried Fruits, pkgs	258
Beef, pkgs	445	Eggs, bbls	7,900
Wool, bales	2,750	Peanuts, bags	820
Hops, bales	540	Leather, sides	66,698
Pork, bbls	1,519	Sugar, hhds	—
Tallow	1,356	Oil cake	3,130

HINTS TO SHIPPERS.—Pack produce as firmly as its nature allows; otherwise many items suffer in appearance, if not in quality, through the jostling incident to transportation. Do not mark packages with any material that will smudge. A good paint for marking purposes can be made of bichromate of potash and extract of logwood. Nailed cards are very insecure. For long lines of goods a marking plate or brand is preferable to ordinary lettering. At the time of shipment put a complete list of the lot into one of the packages if it can be done; but be sure to mail to consignee a full list, naming date, style of packages and contents. Aim to have each parcel of uniform quality as far as possible; mixing always injures sale. Roll butter should be wrapped in clean white muslin. Dressed poultry should be packed in well shaken dry straw. When poultry sweats in boxes straw-dust gives a mean look. Break off nail points from the inside of old barrels when they are used in order to prevent property from tearing. Short cut dry straw is better for packing eggs than anything else. Try and avoid the arrival of summer items here on Saturday.

BEESWAX is lower, with rather freer supplies and a slow inquiry. Quoted, 31@32½c. for Western and 32@32½c. for Southern. Exports past week, 250 lbs. Since Jan. 1st, 43,025 do.; same time last year, 51,850. do.

BEANS AND PEAS.—Exports of beans past week, 890 bbls.; since Jan. 1st, 40,612 do.; same time last year, 10,093 do. Exports of peas past week, 577 bu.; since Jan. 1st, 472,016 do.; same time last year, 231,743. Quotations for beans generally hold up remarkably well, considering the light demand of the past fortnight. Buyers of mediums regard prices high, and purchase only for actual wants. Marrows are quoted 5 cents easier than at our last. There was a movement to mark them down, but the limited stock of prime gives holders considerable independence. Crop advices indicate a smaller curing than for last year, and holders prefer to carry their best stored lots to a period when the fact may favor them. Prime pea beans would sell if here. White kidneys doing decidedly better. Red kidneys steady and firm. Black beans quiet. Canadian beans quiet and nominal at 97c. Hence the recent removal of sound lots of green peas the market is stiffer.

Beans—Prime pea, $1.25@1.30; fair to good, $1.00@1.10; prime mediums, $1.05@1.10; fair to good, 80@90c.; poor, 10@50c.; prime marrows, $1.45@1.50; fair to good, $1.20@1.30; prime white kid., $1.40@1.50; other, $1.15@1.25; prime red kidney, $1.10@1.15; other, $1.15@1.25; Lima (Cal.), $2.75@3. Black beans, $3.75@4.00. Peas—Canadian, in bulk and bond, 97c.—c.; green, $1.10@1.15; split, ₱ bbl., $6.

BUTTER.—A steady demand and light supplies have kept prices in sellers' favor. The strongest feeling is in fine pails, creamery very firm. Half tubs of fine table grade are closed out upon arrival. The outside trade prefers half tubs or a style of package not returnable. The trade is to be congratulated upon the favorable movement that has worked down the under grades of stock. A very dull summer was feared at the opening and the bad condition of stock resulting from the unusual heat threatened to clinch an unprosperous period. But judicious shipments from the interior and a timely export demand have put the market in a better shape than might have been expected. Foreign buyers are now paying more; money for nice sound parcels and the comparative scarcity of such stock makes quicker dealing with market men whose trade requires them to be close buyers. Fine and fancy grades are not likely to react until safe weather enlarges shipments. In a mild way 32c. has been made for creamery. Nothing of poor remains below 14c. When pails are all quality they have to get into line with other rejection; hence the wide range.

We quote:—Choice pails, 29@30c.; prime, 25@27c.; poor to good, 15@24c.; creamery pails, choice, 30@31c.; good, 27@28c.; sweet cream pails, 25@30c. State firkins, choice, 26@27c.; fair to good, 22@23c.; do. half firkin tubs, choice, 27@28c.; fair to prime, 22@25c.; do. Welsh tubs, choice, 26@27c.; other, 19@22c.; Western creamery, choice, 28@30c.; other, 25@27c.; do. firkins, best, 19@20c.; other, 13@16c.; dairy tubs, choice, 21@24c.; other, 13@15c.; factory choice, 18@20c.; other, 14@14½c.

CHEESE.—This has been comparatively a dull and unsatisfactory week, chiefly owing to the poor quality of the bulk of parcels arriving, the warm weather working seriously on the grades. Exporters have been less inclined to operate, and on fancy factories prices have been shaded: 9¾c. represents the general market rule for this grade, but a number of lots of about it if not quite fine have been obtained at 9@9¼c. Other parcels which usually sell within ¼c. of the price of fine are now nearly 1c. lower, on account of their showing very freely in the supply, with the light demand. Quotations are:

Fancy factory, 9¾c.; fine, 9@9¼c.; good and prime, 8@8¾c.; fair, 7@7¾c.; do. half-skimmed, 5@6c.; do. skimmed, 3@4c. State farm dairy, fancy, 8¾@9c.; good to prime, 7@8c.; fair and good, 6@7c. Western factory, good and prime, 7@8c; fair lots, 6@7c.; do. cheddar, choice, 8c.; do. flat, choice, 8@8¾c. Exports past week, 59,528 boxes.

COTTON. There has been a fair export demand, but with the Agricultural Bureau Department's report of the crop being more favorable than had been expected, there has been more of a pressure to sell, leading to lower prices.

Quoted at 12 5-32@12 3-16c. for August; 11 13-16@11 27-32c. for September; 11¾@11 17-32c. for October; 11 13-32@11 7-16c. for November; 11 13-32@11 7-16c. for December; 11¾@11 17-32c. for January; 11 11-16c. for February; 11 27-32c. for March; 12c. for April; 12 5-32@12 3-16c. for May; 12 5-16@12 11-32c. for June; 12 15-32@12 ½c. for July.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9¼	9¾	9¾	9¾

Stained.

Good ordinary	9¼	Low middling	10 1-16
Strict ordinary	10 5-16	Middling	11 9-16

DRIED FRUITS.—There is nothing doing in the old stock. New Southern quartered apples in little better supply, but are hard to sell over 6c. Some choice new North Carolina sliced were offered at 9c. Peeled peaches, of new crop, range from 13 to 15c., the latter difficult to get. Cherries are held more firmly; quoted 14½c. with some lots, however, held off the market at this rate.

Apples—State, sliced, 8@8½c.; do., quarters, 7¾@8¼c.; southern sliced, 7¾@8c.; fancy do. at 10⅜@11⅞c.; do., new quarters at 6½c. Blackberries, 7@7½c. Peeled peaches, new, nominally 13@15c., as to quality; unpeeled peaches, new, nominal. Plums at 13@15c. Raspberries, 21c. Cherries, 14½@15c.

Exports past week 114 lbs. dried apples. Since Jan. 1st, 2,007 do.; same time last year, 10,100 do.

EGGS.—We have seldom seen the egg trade so disordered in a summer season as it has been for the past fortnight. One prominent conflicting feature is the unbooked-for large receipts, while the low prices that most sellers are willing to have for Western are not inducive, as stock is losing heavily. Of course the sales are fully "loss off," but when good State marks are accessible at 16@17c., buyers prefer them for the present light demand, especially while fruit is in demand. We learn there has been a large liming in N. Y. State this season. We quote:

Near points, 17@18c., State and Penn., 16@17c.; Western, prime, 14c.; do. other, 12@13c.; Canadian, 13@14c.

ESSENTIAL OILS.—The following are the latest revised quotations:

Oil peppermint, glass, $3.75; do. tin, $2.90; spearmint, glass, $3.50; do. tin, $2.75; wintergreen, $2.80; sassafras, 35c.

FEATHERS.—Quiet. We quote prime live Western geese, 53@55c.; other do., 25@40c.

FLOUR.—The warm weather last week has seriously interfered with trade, leading to purchases only on urgent requirements, and with free supplies prices have ruled weak. The closing market shows a little more strength on reports of continuous rains abroad and the effect upon the trade there.

For poor to very choice superfine State, $3.50@4.25; $4.30@4.60 for very common to fair extra do.; $4.65@4.75 for good extra do.; $4.80@5.15 for fancy do., and $5.30@6.40 for very choice extra; $3.50@4.25 for superfine Michigan Indiana, Iowa, &c.; $4.35@4.55 for shipping extra do., the inside price for inferior, and $4.60@5.10 for choice to very fancy extra do.; good to choice white wheat extras at $5.50@6.50; fancy do. $6.75@8.25; winter wheat, good to choice family city mill extras, $6.00@7.00, round-hoop Ohio, $4.50@4.85, and trade brands of do. at $5.00@6.75; St. Louis, $4.60@5.90 for common to fair extra, and $6.15@8.25 for good to very choice; Minnesota "straight" at $4.50@7.10, and patent at $6.40@9.00; unsound stock at from $3.25@5.60; city mills extra at $5.50@5.90; No. 2 at $2.25@3.25. Corn meal is lower. Yellow Western, Pennsylvania and Jersey, $2.60@2.85; Brandywine, $3.15@3.30.

FRESH FRUITS.—Peaches are arriving large and handsome, but, although the supply is a moderate one, prices have to be tempered to suit the means of buyers. When baskets start at over one dollar, even choice fruit is apt to be left over at noon. The glut, however, is over, and with the prospective return of our absent families, the end of the crop is likely to do well. A helping feature to the peach market is the sales of general sorts for preserving. N. J. peaches are running poor and small. Apples are still in overstock, and low prices are ruling even for fine qualities. California Bartletts are turning out soft; hence the wide range. N. J. Bartletts are arriving, but hardly in a quotable quantity. Watermelons were seldom so cheap. Plums open low. There is a good assortment of grapes, but few are fine enough to bring full prices. We quote:

Apples, best, ₱ bbl., $1@1.25; do. common, 50@75c. Peaches, Delaware, fancy, ₱ basket, $1; plain, 50@75c.; crates, 75c.@$1.25; N. J. peaches, baskets, 25@50c. California pears, ₱ box, $1@1; do. Bartletts, ₱ crate, $3@4.50; other table pears, ₱ bbl., $3@4; cooking pears, $1.50@2. California plums, good, ₱ box, $3@4; best, ₱ bbl., 7@8; other, $5@7. Grapes—Hartford, Ives and Concord, ₱ lb., 4@7c.; Delaware, 8@10c.; Martha, 12@15c. Whortleberries, ₱ bush., $1.70@2. Nutmeg melons, ₱ bbl., $1.50@2.25. Watermelons, ₱ 100, $5@12. Peanuts dull at $1.40@1.60 for Virginia; common, $1@1.35.

GRAIN.—Wheat has been very much depressed, the sales having been the smallest for a similar period ever known in this market. Prices have ruled lower and very irregular; a little more confidence comes at the close on a little better position of the English market, based upon possible injury by rainy weather there. Latest sales are of prime No. 1 Sheboygan spring, in store, $1.17½; No. 1 Minnesota spring, very good, afloat, $1.15; fair steamer No. 2 Milwaukee spring, 98c., with good lots to $1; No. 2 Chicago spring, 95c.@$1; new crop white Kentucky, $1.20. Rye at 63c. for Western, 83@85c. for Canada, in bond, and 75@76c. for State. Corn has a fair export demand; sales at 55@56c. for steamer to very choice and ungraded Western mixed; 56@55c. for hot and warm; Western yellow, 55@56c.; Southern, 55@56c.; do. white, in store, 60c.; white Western, 63c. for a car lot; New York steamer yellow, 58c. Oats have a fair inquiry at firm rates. Latest sales are No. 2 Chicago, 35@40c. for warm to strictly prime; mixed Western at 37@43c., the latter for fancy; No. 2 Milwaukee, 37@38c., in store, for fair and prime lots; white Western, 35½@45c. for car lots; new crop white State, fair, 40c.; fancy lots, 43c.; mixed State, 39@41½c., and 38½@40c. for warm do.

HAY AND STRAW.—The market may be now regarded as quite steady, with increased demand for all grades.

Bale hay is quoted:—Shipping, 60@65c.; retail qualities 70@90c.; clover, 50@60c.; salt, 55@65c. Straw is quoted at 65@75c. for long rye; 60@65c. for short rye; 50@60c. for oat.

Exports past week 513 bales; since Jan. 1st, 32,568 do.; same time last year, 30,300 do.

HIGHWINES.—Lower; held at $1.12½.

HIDES.—There is less doing, but a firm feeling as regards prices. Small lots of new come in daily and are taken at 30@35c. There is no change in the tenor of despatches from abroad or the interior respecting the crop.

N. Y. State, 10@20c.; Eastern, 8@15c.; Wisconsins; 8@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californias (nominal), 15@18c. ₱ lb.

OIL CAKE.—Western selling at $33.50 per ton.

POULTRY AND GAME.—Dressed poultry is almost nominal. Chickens only showing any improvement. Dry-picked chickens, 20@24c.; scalded, 17@21c.; dry-picked fowls, 15@17c.; scalded, 13@15c.; turkeys, 13@17c. Live poultry is in large supply, and dealers have to accept low prices. We quote spring chicks, near points, 17@18c.; Western, 14@16c.

Fowls, N. J., ₱ lb 14@15c.; do. Western, 10@12c. Roosters, 6@8c.; Turkeys, N. J. 13@15c.; do. Western, 12@14c.; Ducks, N. J., pair, 75c.@$1; do. Western, 55@70c.; Geese, N. J., $1.75@2.25; do. Western, 1.25@1.50.

Game is quiet. Stall-fed pigeons, $1.25@1.37; do. squab, 87c.@$1; tame live pigeons, ₱ pair, 30c.

PROVISIONS.—Hog products generally have been depressed. Mess pork quoted at $18.25 for spot and $18.25 for September. Bacon at 9¾c. for long clear. Western steam lard at $12.75 for spot, August, September and October. Stearine at 13½c. for prime Western. Beef hams at $30 for choice Southern. Beef at $9@11 for plain mess, $10@12 for extra mess, and $14 for packet, the outside prices for small lots choice. Tierced quoted nominal for prime mess and India mess. City extra India mess at $10.

SALT.—Ashton quoted at $2.50; Higgins & Dean's, $1.65@1.70; other brands, $1.15@1.40.

SUNDRIES.—Ginseng, ₱ lb., Southern, $1.15@1.30; Seneca root, 75c. Cider, ordinary to refined, 14@18c. ₱ gal.; cider vinegar, 18@25c. Sheep skins clipped, 30@35c.; do. unclipped, 50c.@$1; lamb skins, 60@65c.

TOBACCO.—There are very fair supplies, but prices hold up well on a fair export demand.

KENTUCKY LEAF—NEW CROP.

	Light.	Heavy.

Fine leaf	15 @16	17 @19

SEEDLEAF—CROP OF 1875.

New England fine seconds	12½@14
Fine fillers	6 @ 7¾
Seconds and fillers, shipping	5½@ 7
Pennsylvania assorted lots	14 @25
Ohio assorted lots	5½@ 6
Wisconsin assorted lots	3 @ 5

VEGETABLES.—Potatoes are scarce again and prices are higher. We shall be apt to have a fluctuating market until late sorts appear. Sweets have declined and there is a better demand. Tomatoes lower.

We quote potatoes, ₱ bbl., $3.25@3.75; sweet do., $3@5. Green corn, ₱ 100, 50@75c. Long Island Tomatoes, ₱ bush., 50@60c.; New Jersey, do., 30c. Marrow squash, bbl., $1@1.25; Wax beans, bag, $1@1.50; Cucumbers, L. I., ₱ 100, 30c.; Turnips, Russia, ₱ bbl., $1.50@1.75. Cabbages, L. I., $4@8 ₱ 100. Onions, $1@1.75 ₱ bbl. Lima beans, ₱ bag, $1.25@1.75. Egg plant, ₱ bbl., $2@2.50.

WOOL.—There is a liberal inquiry from manufacturers and a very strong market: XX Ohio fleeces bring 38@40c. easily, and some parcels are held up to 42c. Spring California is selling at 35@36c. Eastern and Western Texas at 25@32c.

ROCHESTER, Aug. 19.—Flour market dull; spring, $6.50; amber winter, $6.75; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.00. Wheat lower; Milwaukee club, $1.05@1.08; amber winter, $1.05@1.10; white winter, $1.10@1.20. Oats, nominal at 30@33c. Corn quiet at 58@62c. Corn meal, $1.50@1.75. Butter, 18@19c. Cheese, 10@12c. Eggs, 14@15c. Lard, 11@12½c. Apples, bu., 50@60c. Potatoes, bu., 55@65c. Beans, ₱ bu., 70c.@$1. Mess pork, $20.50. Wool, 20@30c. Hay, $8@11. Straw, $6@8. Timothy seed, $2.75@3.50; clover, $9.25@10. Mill feed strong at $16 for shorts, $18 for shipstuffs, and $20 for middlings. Railroad Freights—Flour to Boston, 40c. ₱ bbl.; to New York, 30c., to Albany, 25c.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Aug. 19, 1876.

THE market continues dull, though perhaps not quite so depressed as it was last week. Cheese is suffering very much in consequence of the warm weather, and buyers do not care to handle any more than they can readily dispose of. Prices have not advanced, though the general tone of the market is somewhat improved. The receipts in New York have been light, and the cable denotes more firmness in the English market. Ninety-seven lots, amounting in the aggregate to 10,033 boxes, of factory cheese were sold at from 8¾ to 9¾c. extreme, the bulk selling for 9¼c. About 420 boxes of dairy cheese were disposed of at from 7 to 8½c., most of it going at from 7½ to 8c.

Our advices from abroad are to the first week in August. Our English correspondent says:—English cheese is so heated that it cannot be handled. Dutch slightly dearer. American comes to hand in good order and is much improved in quality; a brisk sale for finest and a good demand for intermediate. The following are quotations:

American, extra fine, 53@54c.; fine, 50@52s.; good, 46@48s.; secondary, 36@44s. English cheddar, 70@80s.; Wiltshire double, 60@66s.; Cheshire medium, 44@56s.; fine, 64@72s.; Scotch, 56@60s. Dutch cheese—Edams, 52@54s.; Gondas, 49@52s.; Derby shape, 54@56s.

Arrivals of Continental butter are short. Market, though not fierce, is firm. Quotations are:

Channels, 130@132s.; Corks, 124@143s.; Jersey, 100@112s.; Friesland, 124s.; Normandy, 110@140s.; American and Canadian, 90@100s.

LIVE STOCK MARKETS.

NEW YORK, Aug. 19, 1876.

BEEVES.—On a moderate run of fresh cattle trade was extremely slow on Monday last; prices ranged from 6¼ to 10½c. ₱ lb.; weights, scant 56@11¼ cwt. The quality of the herds above quoted was from poor rough grass-fed steers to smooth quality corn-fed steers; general quality course but fat. The market closed weak, with several herds unsold. About 500 carcasses of beeves were shipped for London, England, since our last report. Wednesday, trade slow on a light run, with several car loads of poor quality steers remaining unsold when the markets closed at noon; prices were 5½@10¾c. ₱ lb.; weights, scant 56@8¼ cwt. Thursday, trade small at 56@10¼c.; weights, 56@8 cwt. Friday, the markets closed weak at 6@10c.; weights, 55@8¼ cwt. From 50@57 lbs., net, have been allowed to the cwt.; general sales on 55@56 lbs. net. Spanish herds direct from the Plains sold at 5½@7¼c. ₱ lb.; grass-fed native steers, 6½@8¼c.; part corn-fed do., 8½@9¼c.; grade do., 10@10¼c., with a few selected at 11c. Bulls, live weight, sold at $3.30@3.75 ₱ cwt. Dry cows sold at 8¼c. ₱ lb.

Comparative Rates.

Quality.	This week. Cents.	Last week. Cents.
Good	11 @	11½@
Fair	10¾@10¾	10¾@10¾
Poor	9¾@10¾	9¾@10¾
Poorest	5¼@ 9¾	5¾@ 9¾
Gen. selling rates	8¾@ 9¾	9 @10

MILCH COWS.—Trade still slow. One dealer sold 15 springers at $50@55 ₱ head; also, 11 fresh cows at $50@55 ₱ head; 12 do. at $50@60; 6 do. at $55@65—calves included.

VEALS AND CALVES.—Trade fair in smooth quality veals at 7@9c. ₱ lb.; course quality calves, part grass-fed and part buttermilk-fed, sold at 5@8½c. ₱ lb., and at $6@9.50 ₱ head. State calves were largely on the markets. State veals sold at 7@9c. ₱ lb.; Jersey do., 8@8½c.; Pennsylvania do., 7½@9c.

SHEEP AND LAMBS.—Monday last sheep sold at 4@6¾c. ₱ lb., lambs at 5¾@7¾c. Wednesday, sheep, 4½@6¾c.; lambs, 6@6½c., with mixed flocks of sheep and lambs at 5c. ₱ lb. Thursday, sheep, 4@6¼c.; lambs, 4@7c. Friday, sheep, 4¾@5¾c.; lambs, 6@7¼c. Trade has been slow, but firm; quality from coarse to good. State sheep sold at 4@6¾c. ₱ lb.; Ohio do., 4¾@5¾c.; Michigan do., 5c.; Canada do., 5¾@6c.; Kentucky do., 4¾@6c. State lambs sold at 5¾@7c. ₱ lb.; Kentucky do., 6@6½c.; Canada do., 6@6¾c.; Jersey do., 7@7½c.

HOGS.—There were no live hogs on sale the past week. City dressed, on a light run, advanced in price, but did not sell more freely. Rates were 8@8¾c. ₱ lb., all weights included.

HORSE MARKET. The return of intense heat has again depressed city trade in horses. Nineteen poor quality light harness horses sold at $58@95 ₱ head; 11 ordinary quality do., $100@135 ₱ head; 9 roadsters, with fair trotting action, at $225@375 ₱ head; 7 heavy draft horses, $200@235 ₱ head.

BISHOP HAVEN is enjoying life at Martha's Vineyard.

THE King of Siam has just sent M. Thiers an elephant.

AN accomplished Indiana girl calls hay "grass *a la* mowed."

SENATOR BURNSIDE of Rhode Island, has recovered his health.

R. C. NEWELL, "Orpheus C. Kerr," is reported in very poor health.

EDWARD EGGLESTON, the story-book writer, is camping out at Plymouth, Vt.

SIR ROSE LAMBERT PRICE has given five pounds toward the Custer monument.

THE Emperor of Brazil is going to Ephesus, to visit the site of the Temple of Diana.

IT transpires that young Leander Richardson was not killed by the Indians after all.

LORD LYTTON only suffers from indigestion, which does not interfere with his work.

MISS M. C. CLEVELAND, niece of the late Horace Greeley, will enter a convent in the autumn.

THE Hon. J. C. Bancroft Davis, our Minister to Germany, is on his way home for a short visit.

"PA," said a little fellow to his unshaven father, "your chin looks like the wheel in the music box."

AUGUST BELMONT won $12,650 in the Long Branch races, and the Lorillards $11,000 between them.

MR. DISRAELI has accepted a peerage, and will leave the House of Commons for the House of Lords.

DISRAELI, in one of his novels, calls a peerage "a refuge for incompetency, or a step toward the grave."

SOME Chicago ladies have been managing a yacht race. The sails were cut bias and trimmed with real lace.

GEN. JOE LANE is living in a small frame house on a spur of Rogue River Mountain, in Oregon. He is eighty-three years old.

OLIVE LOGAN has recently taken a run over to London. She speaks of Mr. Pierrepont's after-dinner speeches as "charming."

BOTH young Andrew Johnson and Henry Clay, sons of the "great commoners," were defeated at the recent election in Kentucky.

THE Rev. Henry M. Field, editor of the Evangelist, who has just completed a tour of the world, is now at his home in Stockbridge, Mass.

ABSENT-MINDED people leave all sorts of things in the street cars. Somebody left a cage and a bird in one of the New York cars recently.

THE Rev. George H. Hepworth of New York, has assumed the debt of his church, amounting to $125,000. Hepworth must be worth a heap.

A MAGAZINE writer asks: "Do birds die a natural death?" As birds do not employ physicians, we can see no good reason for asking that question.

THE Richmond, Va., police are all under the weather. It is in consequence of a free watermelon that weighed one hundred and twenty pounds.

BOSTON uses six thousand dozen bottles of lager a day, while the saloon custom has much increased, though the sale of stronger liquors has much fallen off.

STOP-WATCHES are getting to be very common. You can buy a watch in Rochester which will stop most all the time for about five dollars.—*Rochester Democrat.*

MRS. ROBB of Corpus Christi, is called the "Cattle Queen of Texas." She owns 75,000 acres of land, on which 15,000 head of cattle are fattened for market each year.

MARK HOPKINS, the venerable ex-President of Williams College, with his family and a few friends, are having a sort of private camp meeting at Ball Mountain, Mass.

A TELEGRAPHIC despatch from the West states that "Mrs. Abraham Lincoln is starving at Boulder, Colorado." Make the word "staying" and it tells the story exactly.

"FOR man," says Talmage, "marriage is the only estate that is right." And if he marries a society woman, he is lucky at the end of a year if he finds he has any estate that is left.

"TANNERS never die and always grow rich," is the sententious ending of an editorial in a New Orleans exchange, setting forth the peculiar facilities of that place as a location for tan-yards.

HE bought a cheap coat of one of the gentlemen from Jerusalem, and he observed next day that it was made of two kinds of cloth, or else it had faded from some previous wear and tear. He went to the dealer with fire in his eyes. The dealer looked at the garment without surprise, and at the wearer with extreme wonder. "Vy, mine goodness!" he said, "you been wear de goat in de sun! You think him mant of sheet iron, hey!"

THE mad extravagance of ladies of fashion in their present style of dress may properly be termed a new form of *delirium tremains.*

SARA BERNHARDT, the great French actress, has installed her coffin in her bedchamber in her new hotel near the Parc Monceau. This unique piece of furniture was made at her order two years ago.

A TRAIN of 110 cars, carrying 5,000 passengers, passed over the Pennsylvania Central Railroad from Pittsburg to Philadelphia last Wednesday. It was the largest passenger train ever run over this road.

THE Catholics in Boston have wisely decided to discontinue the hiring of carriages for funeral processions except for the chief mourners, and to give the money which a costly funeral requires to the widow and children.

FIRST School-girl (sweet eighteen)—"I *am* so tired of walking along by twos and twos in this way! It's as bad as the animals going into the ark!" Second ditto (ditto ditto)—"*Worse!* Half of *them* were masculine!"

A SARATOGA correspondent who doesn't seem exactly satisfied with the way hotels are run in that village, advises visitors to bring Herring safes with them. There is, certainly, something suggestive about that advice.

G. SMITH, the Assyriologist, has discovered on the Euphrates what he believes to be the site of Carchemish, the Capital of the Hittites, a city which promises to yield as interesting and important remains as Nineveh itself.

PROF. HUXLEY is 51 years of age, is of medium hight, compactly built, with very dark complexion, small black eyes, dark hair and side whiskers tinged with gray. In manner he is affable, good-humored, and exceedingly unpretentious.

THE new tongue to the thirteen thousand pound bell of liberty at Philadelphia, was forged at Winsted, Conn. The tongue weighs four hundred pounds, and takes the place of the one hundred and fifty pound clapper, which was too light.

THE firm of A. T. Stewart & Co. has lately made $1,000,000 by a rise in the value of raw silk. Before the death of Mr. Stewart he was induced to buy up large quantities of silk in anticipation of a rise, and the wisdom of his purchases is now apparent.

CAPT. RICHARD KELLY of Falmouth, England, has received from the President of the United States a handsome telescope suitably inscribed, as a reward for his bravery and humanity in rescuing the crew of the American brigantine H. F. Eaton in Atlantic mid-ocean in 1871.

MR. JAMES ELBERT POWELL, the managing editor of the Saturday Evening Post of Philadelphia, will lecture during the coming season on "Plebe Life at West Point." He is the youngest platform speaker in the United States, and has been well received by audiences in the South and West.

THE time for husking bees comes soon. The husking bee is a delightful entertainment given by the farmers, and is generally attended by eighteen young men, who kiss each of the girls in the house seven times, husk four ears of corn, and go home as soon as they have disposed of what cider they can find.

HON. C. OSCANYAN, late Turkish consul general, has a new lecture for the coming season on "The Women of Turkey, or Domestic Life in the East." He will be accompanied by four *hanmums*, or ladies, who assist him in his delineations of the various phases of social life in the East, by appearing in appropriate costumes representing different characters, and forming picturesque tableaux.

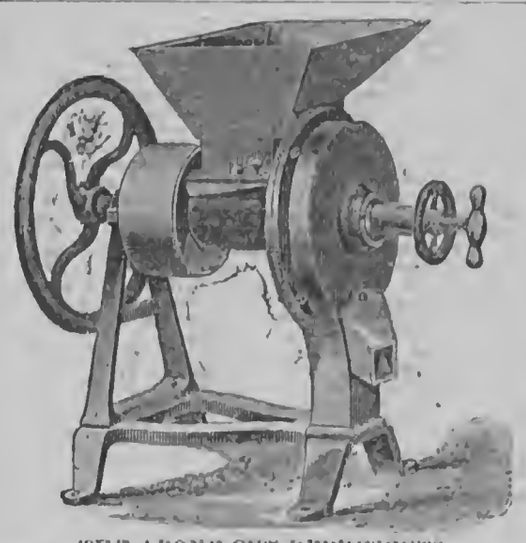
AT last, thanks to science, the baggage-smasher has met his match. He undertook the other day to handle one of the new vulcanized fibre trunks in his usual playful manner, by turning it two or three somersaults and then slinging it twenty feet, but it rebounded unhurt, struck him on the *os frontis*, and the doctor says he don't think he can get him out again inside of three months anyway.

IT is related that while Dom Pedro was at Newport, R. I., he made a request to have Oliver Caswell—an educated deaf and blind mute of whom he heard—visit him. The request was complied with. When Mr. Caswell was brought before the Emperor, he exhibited a small basket made by his own hands, in proof that he was not a drone, but could do something towards a support for himself. The Emperor was so touched by the incident, that he ordered the basket to be filled with gold pieces.

THERE is no truth in the statement, which has appeared in many English papers, that a number of members of the British House of Commons were going out in a body to the Philadelphia Exhibition, and that a steamer had been placed at their disposal by the White Star Line. The story arose out of a practical joke on the part of a few members. One member being asked whether it was true that a Parliamentary deputation was going by the White Star Line, said: "Oh, no! by the Canard!"

IT is very easy to write long articles, profound with medical learning and wisdom, advising people, as they value health and life, to avoid "hurrying" and "excitement" during the heated term; but when a man is only ten feet away from a pet-land gentleman cow, and sixty-five feet away from the nearest point in the pasture fence which they are both heading for with all the intensity of purpose that can actuate living creatures, who is going to stop and feel his pulse to see whether he is in more of a hurry than is warranted by the laws of hygiene?—*Burlington Hawkeye.*

Implements and Machinery.



THE ABOVE CUT REPRESENTS

THE VICTORY CORN MILL.

This mill will grind corn and cob rapidly, coarse and fine; also, all other kinds of grain or seed. Capacity, **10 to 20 bushels per hour.** It is made entirely of iron, except the hopper. It is strong, durable, and not liable to get out of repair. It will grind more feed with less power than any other mill in the market. This is no humbug. We warrant it to do what we claim. Agents wanted everywhere. Price $40, delivered on cars at Springfield. Address

T. ROBERTS & CO., Springfield, Ohio.

☞ We also manufacture 4½ horse-power Vertical Portable Engines, suitable for running these mills, or for any other purpose for which power is required. Price $220.

ENGINEERS and Engine Owners should all understand the *Allen Governor.* Illustrated Circular free. S. B. ALLEN, Boston.
